INTRODUCTION

MORE than five hundred distinguished contributors are represented in this fourth issue of the *Britannica Book of the Year*. The physical proportions of the volume are the same as in other years. Because official statistical data of production and finance were not generally disclosed by the governments of European and other warring countries, it seemed inadvisable in a number of instances to attempt to estimate them this year. Also, in order to make room for complete and comprehensive coverage of the war, material which needed, according to the judgment of the authors, little or no change as against the record of the preceding year has been condensed. The cumulative index at the back of the book is a guide to such material in earlier volumes.

Franklin H. Hooper, for forty odd years associated with *Britannica* and for many of them Editor and Editor Emeritus, passed away during 1940. His life was one of much work and rich service to people. His strength lay in the fact that he believed profoundly in man's ability to take care of himself ultimately. For all his years—and years have a way of making one cautiously conservative—Mr. Hooper was not afraid of change or of new ideas, although he did not deny the value of some old ideas. Problems never discouraged him. Obstacles were an inspiration. He tackled fresh tasks with the enthusiasm of a much younger man and always got them done.

This issue of the *Britannica Book of the Year* is dedicated to the memory of Mr. Hooper, who edited the first issue in 1938. He was a great American, a renowned encyclopaedist, and a liberal with the true liberal's serenity and optimism. He knew the world well. It couldn't fool him. A year's trials—even a dark year like 1940—could mean little more to him than that, in the long view, man's destiny remains unmistakable. It moves through suffering toward tolerance, free inquiry, final peace.

The Editor

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPAEDIA BRITANNICA

LIBRARIAN CONSULTANTS

ANNE FRASER LEIDENDEKER, *Department Librarian, Science and Industry Department, Public Library, Los Angeles, Calif.*

CHARLES F. MCCOMBS, *Superintendent, Main Reading Room, New York Public Library.*

CALENDAR OF EVENTS, 1940

For elections, disasters and assassinations of 1940, see under those headings in the text. For obituaries of prominent persons who died during 1940, see under the entry Obituaries.

JANUARY

1 Vladimir Sokoline, undersec'y general of the League of Nations, only Russian on the staff, was dismissed.

2 The U.S. supreme court, in a unanimous decision, ruled that there could be no appeal to the courts from a decision of the National Labor Relations board designating the union which was to negotiate with an employer.

Cordell Hull, U.S. sec'y of state, made a formal protest to Great Britain against the removal from British and neutral vessels on the high seas of American mail addressed to neutral countries.

The Republican national committee reported to the clerk of the house of representatives that it had collected \$1,092,037 in 1939; the Democratic national committee reported collection of \$731,116.

3 Pres. Roosevelt in his annual message to congress said that the nation was committed to peace, defended the trade agreements made by the department of state and asked for larger appropriations for national defence with some new taxes.

The Federal Communications commission recommended consolidation of the Western Union and Postal Telegraph companies.

The congressional committee on un-American activities reported that neither John L. Lewis nor the Congress of Industrial Organizations was communistic, but that several unions in the C.I.O. were tainted with communism.

4 Pope Pius XII appointed the Most Rev. Samuel A. Stritch, archbishop of Milwaukee, to succeed the late Cardinal Mundelein as archbishop of Chicago.

Pres. Roosevelt in his budget message recommended the expenditure of \$8,424,000,000 for the fiscal year 1941, including \$1,800,000,000 for national defence, advised raising \$460,000,000 by new taxes and estimated the deficit at \$1,716,000,000.

The Irish parliament authorized the gov't to intern without trial members of the Irish Republican army.

Pres. Roosevelt nominated Attorney-General Frank Murphy to succeed the late Pierce Butler as associate justice of the supreme court and Solicitor General Robert H. Jackson to succeed Mr. Murphy in the cabinet.

5 Leslie Hore-Belisha, sec'y of state for war in the British cabinet, resigned and was succeeded by Oliver Stanley, promoted from the presidency of the board of trade.

Premier Hubert Pierlot of Belgium submitted his resignation to the king and was immediately commissioned to form a new cabinet.

6 The surgeon general of the health service reported that the death-rate in the U.S.A. for 1938 was the lowest in history.

8 U.S.A. and Australia announced establishment of direct diplomatic relations, with Richard G. Casey as first Australian minister to Washington and Clarence E. Gauss as first U.S. minister to Canberra.

Rationing of bacon, ham, butter and sugar began in Great Britain.

Pres. Roosevelt said at Jackson day dinner that future belongs to political leaders who can win support of independent voters.

Kenneth Crawford elected president of American Newspaper guild.

10 House of representatives passed Gavagan anti-lynching bill by vote of 252 to 131 with 124 Democrats voting against it.

RFC and Export-Import bank arranged for loan of \$10,000,000 to Norway for purchase of U.S. agricultural products and manufactured goods.

12 Pres. Cárdenas of Mexico declared that Monroe Doctrine ceased to exist in its original form when the American republics agreed in 1936 to protocol against intervention by one country in affairs of another.

13 It was announced in Sofia that Bulgaria and Turkey had reached an agreement for maintenance of peace and neutrality in the Balkans.

14 Gen. Nobuyuki Abe, Japanese premier, resigned and Adm. Mitumasa Yonai was

commissioned to form new cabinet.

Federal Bureau of Investigation announced the arrest in New York of 18 members of so-called Christian Front, charged with "plotting to overthrow the gov't of the U.S."

15 British foreign office, in formal answer to the American nations which decreed neutrality zone extending 300 mi. around western hemisphere, declared that it was impractical to enforce neutrality in the zone.

Pres. Roosevelt reported to congress that \$11,776,501,570 had been spent for relief since April 1935, and asked for authority to develop a national playground in the Tennessee valley.

16 Rear Adm. Byrd notified the navy department that his ships, the "Bear" and "North Star," had arrived at the Bay of Whales in Little America in the antarctic.

18 A trade treaty between France and Spain was signed in Madrid containing an agreement for the purchase of certain commodities of each country by the other.

30,000 Russians reported retreating from the Salla sector in Finland after an unsuccessful attempt to force their way through to the Gulf of Bothnia.

19 French senate approved by unanimous vote bills passed by chamber of deputies Jan. 16, excluding from parliament and municipal gov't all communists who had not withdrawn from that party before Oct. 26.

20 Great Britain refused to abandon practice of examining mail addressed to neutral countries, carried in American or neutral ships.

22 Celebration of 100th anniversary of landing of first white settlers in New Zealand began at Wellington.

Earl Browder, sec'y of U.S. Communist party, convicted of obtaining passport by fraud, sentenced to four years' imprisonment and fined \$2,000.

Ignace Jean Paderewski elected president of the Polish gov't set up by exiles in France.

23 House of representatives voted to extend life of its committee on un-American activities for a year.

24 John L. Lewis, in address at United Mine Workers' annual convention in Columbus, O., said that the national administration had broken faith with labour and that Pres. Roosevelt would be ignominiously defeated if he ran for a third term.

25 The Canadian parliament met, listened to speech from throne and adjourned to enable gov't to appeal to country for approval of its war policy which had been severely criticized.

26 Gov. Bottolfsen of Idaho appointed John W. Thomas to the U.S. senate to succeed the late W. E. Borah.

U.S.-Japanese trade treaty, denounced by the U.S.A. July 26, 1939, expired at midnight.

27 Russian attempt to get behind the Mannerheim line around Lake Ladoga with 70,000 men repulsed by the Finns.

A decree issued in Madrid restored to the Jesuits the property in Spain confiscated by the gov't in 1932.

MAY—Continued

least \$1,000,000,000 more should be spent for U.S. national defence; he asked authority to call out the national guard and all reserve forces if necessary.

London announced that three-fourths of the British expeditionary force in Flanders had been safely evacuated from Dunkirk.

JUNE

1 The 35,000-ton U.S. battleship "Washington" was launched at the Philadelphia navy yard.

German planes raided southern France for the first time, dropping bombs in the Rhone valley and on the port of Marseilles.

Ion Gigurtu, a pro-German, was named foreign minister of Rumania.

2 The Germans continued their air raids in the south of France for the purpose, in French opinion, of influencing Italian decision regarding entry into the war.

U.S. liner "Manhattan" sailed from Genoa with 1,964 American refugees on board; "President Roosevelt" sailed from Galway with 720.

National convention of the U.S. Communist party at New York city nominated Earl Browder of Kansas for president and James W. Ford of New York, a Negro, for vice-president.

Portugal began a six-month celebration of the 800th anniversary of its founding and the 300th anniversary of the recovery of its independence.

3 Resolutions were introduced in both houses of U.S. congress declaring that the U.S.A. would not acquiesce in the transfer of any geographical region in the western hemisphere from one non-American power to another.

National conference of governors, in session at Duluth, Minn., voted that all necessary

steps should be taken to provide adequately for national defence and pledged each state to co-operate toward that end.

German planes dropped more than 1,000 bombs on Paris, killing 254 persons and injuring 652; French planes in retaliation bombed German cities.

Indefinite postponement of international exposition of 1942 in Rome announced by Italian gov't.

Gov. Lehman of New York called out 500 members of the national guard to protect the 74 state armories.

4 German troops took possession of Dunkirk after it had been evacuated by the Allies; nazis occupied last of Belgian territory.

Prime Minister Churchill, in describing the evacuation of Dunkirk to the house of commons, said that even if the British had to stand alone against the German military machine, the empire would fight to the bitter end until in "God's good time" the new world came to the rescue of the old.

Sir Stafford Cripps, a left wing labourite, was accepted by the U.S.S.R. as British ambassador to Moscow.

Charles Edison, U.S. sec'y of the navy, resigned to run for governor of New Jersey on the Democratic ticket.

5 The Germans began an attack upon the French on a battle line extending 120 mi. east from Abbeville on the English channel with a reported force of 1,000,000 men, 1,000 bombing planes, 2,250 tanks and 15,000 motor vehicles.

Premier Reynaud of France re-made his cabinet, dropping former Premier Daladier as minister of foreign affairs and assuming that post himself.

International Ladies' Garment Workers union resumed its affiliation with the American Federation of Labor.

Federal Communications commission forbade amateur radio operators to communicate in any way with foreign stations.

6 U.S. state department ordered that, beginning July 1, all visitors to the U.S.A. from

Canada, Mexico, Cuba and several other American countries should have passports.

U.S. navy department announced it would return 50 planes to their manufacturer, to be replaced by new ones with the understanding that the manufacturer would sell the old planes to the Allies.

Naval appropriation bill calling for \$1,492,000,000 was sent to the president for his approval.

French army communiqué claimed wholesale destruction of German tanks but conceded enemy advances below Abbeville and Laon.

7 Italian merchant ships at sea were ordered to take refuge in the nearest neutral port.

8 French army's left wing retreated along line extending from Neufchâtel to vicinity of Soissons.

9 The French battle line was extended to the Swiss frontier, with approximately 2,000,000 Germans engaged; nazis reached outskirts of Rouen.

Lawson Little won U.S. open golf championship at Cleveland, O., defeating Gene Sarazen.

10 Premier Mussolini declared war against France and England; he exempted Turkey, Switzerland, Yugoslavia, Greece and Egypt from military designs.

King Haakon of Norway ordered that resistance to the Germans should end following the withdrawal of French and British troops from Narvik; he and his gov't went to England.

Pres. Roosevelt, referring in an address at the University of Virginia to the Italian declaration of war, said "the hand that held the dagger had plunged it into the back of its neighbour," and pledged the U.S.A. to give all possible material assistance to the Allies.

French gov't moved from Paris to Tours and other towns in the Loire valley.

Sinking of the British aircraft carrier "Glorious" during evacuation of Narvik announced in London.

Uruguayan minister of defence revealed precautions to

check a suspected German plot to seize the gov't.

11 Pres. Roosevelt, by proclamation, extended the neutrality act to relations with Italy.

Princess Juliana of the Netherlands and her two young daughters arrived in Halifax, N.S.

Italian planes bombed Malta and Aden; British bombed Italian bases in Libya and Eritrea.

Turkey summoned 200,000 additional men to arms, making a total of 550,000 ready for war.

Pres. Vargas of Brazil announced his country's neutrality and said that "vigorous peoples fit for life must follow the route of their aspirations."

Pres. Roosevelt asked congress for \$50,000,000 for American Red Cross relief work.

12 Chung King, provincial capital of China, suffered the severest bombing since May 1939; 127 planes dropped explosives on the city and destroyed the homes of 150,000 persons.

One hour after Pres. Roosevelt signed the naval appropriation bill of \$1,308,171,000, the navy department completed contracts for 22 new warships, including two battleships of 45,000 tons each.

80 bombing planes were released by the U.S. gov't for sale to the Allies.

As Uruguay was about to bring criminal suits against the leaders of German organizations the German minister in Montevideo announced that the nazi party and the German labour front in Uruguay had been dissolved.

British planes bombed Turin and Genoa.

Egypt, pledging loyalty to the Allies, broke off diplomatic relations with Italy; the Allies concentrated battleships at the northern end of the Suez canal to prevent Italy from reaching its east African possessions.

13 Paris was declared an open city in order to prevent its destruction by the Germans.

Premier Reynaud, in a message to Pres. Roosevelt, asked for "clouds of planes from across the Atlantic" to ward off French defeat.

JUNE—Continued

Japanese-controlled Chinese gov't demanded that all armed forces of European belligerents withdraw from China.

The 35,000-ton U.S. battleship "North Carolina" was launched at the Brooklyn navy yard.

Turkey signed a trade agreement with Germany.

Mexican gov't demanded that Arthur Dietrich, press attaché of the German legation, leave the country because of his propaganda activities.

14 Paris was occupied by German troops; nazis opened attack on northern flank of Maginot line; Le Havre fell.

Spanish troops occupied international zone of Tangier.

French gov't moved from Tours to Bordeaux.

Chancellor Hitler ordered a three-day holiday in Germany in celebration of the capture of Paris.

Congress adopted a resolution permitting Finland to postpone payments on its debt due June 15 and Dec. 15, 1940.

15 The Germans outflanked the Maginot line after taking Verdun as the French moved their troops from the fortifications.

Finland paid \$159,398 on its war debt to the U.S.A., the amount due; Rumania paid \$100,000, the first payment since 1932; Hungary paid \$9,828.

Pres. Roosevelt, replying to Premier Reynaud's plea for "clouds of planes," said that the U.S.A. would do all in its power to help the Allies and would not recognize any infringement on the territorial integrity of France.

Col. Charles A. Lindbergh warned against "minority efforts" to involve the U.S.A. in war, insisted that the U.S.A. was unprepared and urged that national defenses be strengthened.

Russian troops moved into Lithuania and took possession of the country.

16 Premier Reynaud resigned; Marshal Henri Philippe Pétain succeeded him and reorganized the cabinet with Camille Chautemps as vice-premier and Gen. Weygand as minister of defence.

Sen. Key Pittman (Dem., Nev.) criticized Col. Lindbergh for his speech of June 15 and charged him with trying to destroy confidence in the national administration.

While the French were considering surrender, Prime Minister Churchill proposed to them a Franco-British federation; the plan was rejected by Pétain's gov't.

17 France sued for "an honourable peace."

Bills were introduced in U.S. congress providing for construction of 84 warships within four years at a cost of \$1,200,000,000.

Russia followed its occupation of Lithuania by sending armed forces into Latvia and Estonia.

18 Hitler and Mussolini met in Munich to draft the terms on which they were willing to end the war with France.

Prime Minister Churchill told the house of commons that Great Britain had not released France from its agreement not to sign a separate peace.

German planes, in the first concerted attack on Britain, raided the eastern coast of England.

Germans took Cherbourg on the French coast; French admitted capture of Orleans.

19 The earl of Athlone, new governor general of Canada, arrived at Halifax, N.S.

The U.S.A. notified Germany, Italy, France, Great Britain and Holland that it "would not acquiesce . . . in any attempt to transfer any geographic region of the western hemisphere from one non-American power to another non-American power."

German minister in Montevideo protested against what he called the unfriendly attitude of the Uruguayan gov't in its campaign against German "fifth column" activities.

Pres. Roosevelt commissioned Sidney Hillman to study his proposal to give 2,000,000 American youths some form of compulsory semimilitary training every year.

20 Harry H. Woodring, U.S. sec'y of war, resigned; Henry L. Stimson of New York nominated as sec'y of war and Frank Knox of Illinois as sec'y of the navy.

France asked Italy for an armistice.

Pres. Roosevelt approved plans for putting control of the export trade of the western hemisphere in the hands of an inter-American export corporation and directed the sec'y of state to make the necessary arrangements.

A bill providing for the compulsory registration of all men between the ages of 18 and 65 for selective military training was introduced in the U.S. senate.

Joe Louis successfully defended his title as heavyweight champion by knocking out Arturo Godoy in New York city.

21 Representatives of Germany, led by Chancellor Hitler, met French representatives to negotiate terms of peace in the Compiègne forest on the spot where the armistice of 1918 was signed.

King Carol of Rumania organized a single totalitarian "party of the nation" to supersede all other political parties.

22 Germany and France signed an armistice in the Forest of Compiègne by which France agreed to surrender all its sea forces and demobilize its land and air forces; terms also provided for nazi occupation of approximately half of France.

U.S. congress passed an act raising the limit of the national debt from \$45,000,000,000 to \$49,000,000,000 and approved a national defence tax bill to yield \$994,300,000 a year.

Sec'y of State Hull announced that 20 Latin-American countries had accepted the invitation of the U.S.A. to attend a conference to consider economic and political problems arising from the European war.

23 Great Britain withdrew recognition of the French gov't which accepted the terms of the armistice with Germany.

A French national committee led by Gen. Charles de Gaulle was formed in London to carry on the war with the aid of "free" French forces.

24 The French signed an armistice with Italy, and an order to end hostilities was issued.

Hitler ordered that Germany's victory over France should be celebrated in the reich by a display of flags for ten days and ringing of bells for seven days.

The French gov't ordered a day of mourning.

Pres. Roosevelt, after receiving a report from the attorney-general that the sale of warships to belligerents was forbidden by law, countermanded an order to turn over to the builders 20 torpedo boats for sale to England.

Nine of 13 defendants accused of plotting to overthrow the gov't of the U.S.A. were acquitted in Brooklyn, N.Y.; a mistrial was ordered in the case of four.

The Republican national convention opened in Philadelphia with Gov. Harold E. Stassen of Minnesota making the keynote speech.

Yugoslavia entered into diplomatic relations with Russia by sending a minister to Moscow.

25 Fighting between France and Germany and Italy ceased at 12:35 A.M., French time.

Edouard Herriot, Joseph Paul Boncour and Leon Blum, former French premiers, fled from France and arrived in London.

Negotiations with Henry Ford to build 6,000 aeroplane engines for England were broken off when Mr. Ford announced that he would build no engines for a foreign power.

Plans for training 5,000 young men a year as officers in the U.S. naval reserve were announced by Pres. Roosevelt.

Pres. Roosevelt signed new tax bill which reduced exemption from income taxes for married persons from \$2,500 to \$2,000 a year and for single persons from \$1,000 to \$800.

The Germans occupied the whole Atlantic coast of France.

26 U.S. Export-Import bank granted a credit of \$20,000,000 to Argentina for the purchase of construction materials in the U.S.A.

The Republican national convention adopted a platform favouring adequate national defence and opposing intervention in the European war.

Russia ordered the substitution of an 8-hr. 6-day week for the 7-hr. 5-day week in order to speed up production of war munitions.

27 Rumania yielded to Russia's demand for Bessarabia and northern Bukovina; Russian troops moved into the ceded territory.

Pres. Roosevelt declared the existence of a national emergency to enable the gov't to control American and foreign shipping in U.S. territorial waters and around the Panama canal.

28 Wendell Lewis Willkie of New York nominated by Republicans for president and Charles Linza McNary of Oregon for vice-president.

Great Britain recognized the French national committee in London as the leader of all "free" Frenchmen, and as an ally.

29 When Russian troops moved from Bessarabia into Moldavia, a part of Rumania not ceded to Russia, King Carol ordered the mobilization of all Rumanian troops.

pay had been granted and a plan for settling future disputes had been agreed upon.

27 The Dies committee issued a "red book" containing evidence of alleged subversive activities of communists in the U.S.

Members of the Nazi Iron Guard in Rumania broke into the military prison at Jihlava and killed 64 former officials of ex-King Carol, charged with the death of Corneliu Codreanu, leader of the Iron Guard, and 13 others in 1938.

28 Thanksgiving day was observed in 16 states.

20 more Rumanian political leaders, including former Premier Nicolas Iorga, were assassinated; Rumanian and German troops moved into Bucharest to preserve order.

A riotous mob of supporters of Gen. Almazán gathered about the U.S. embassy in Mexico City on the arrival of Henry A. Wallace, to protest against the validity of the election of Gen. Avila Camacho.

William Green was re-elected president of the American Federation of Labor.

Kjosti Kalliö, president of Finland, resigned because of ill health.

29 Gen. de Gaulle reported in London that "Free France" had 30,000 men under arms, 20 warships, 1,000 aviators and 60 merchant ships.

30 Pres. Morinigo proclaimed a dictatorship in Paraguay.

Germany announced that Lorraine had been incorporated into the Reich and united with the Saar region under the name of Westmark.

A treaty formally recognizing the puppet gov't of China under Wang Ching-wei was signed by Japan in Nanking.

Following the Japanese recognition of Wang Ching-wei's gov't the U.S. announced that arrangements had been made to advance \$100,000,000 to the gov't of Chiang Kai-shek.

DECEMBER

1 Joseph P. Kennedy announced his resignation as U.S. ambassador to Great Britain, to take effect on the appointment of his successor.

Gen. Manuel Avila Camacho took the oath of office as president of Mexico and pledged his support to continental solidarity against foreign aggression.

Gen. Antonescu, Rumanian premier, said that Rumania would never renounce its claims to Transylvania, part of which had been annexed by Hungary.

2 Congress passed Logan-Walter bill providing for judicial review of decisions of the National Labor Relations board and other executive agencies.

Pres. Roosevelt signed a bill making sabotage a criminal offence in time of peace and another bill amending the Philippine constitution to change the presidential tenure from one term of six years to not more than two terms of four years.

3 Paul V. McNutt, Federal Security administrator, was named by the National Defense council as co-ordinator of all health, medical welfare, nutrition, recreation and other activities affecting U.S. national defence.

5 In a letter to the Great Lakes-St. Lawrence Seaway and Power conference in Detroit, Pres. Roosevelt said he was preparing for immediate construction of the waterway from the ocean to the Great Lakes.

The British house of commons, by a vote of 341 to 4, rejected a proposal to seek a negotiated peace.

Arrangements were completed by the U.S. to lend \$50,000,000 to Argentina to stabilize its currency.

Russia informed Tokyo that its policy toward the gov't of Chiang Kai-shek in China was unchanged by Japanese recognition of Wang Ching-wei.

6 A Canadian official reported that 10,000 citizens of the U.S. had volunteered for service in the Canadian royal air force since May 1940.

Porto Edda occupied by Greeks.

Marshal Pietro Badoglio, chief of the general staff of the Italian army, was relieved of his command.

7 Pres. Roosevelt assured King George of Greece that the U.S. would extend to him such military aid as was possible.

8 Admiral Domenico Cavagnari, head of the Italian navy, resigned.

Italians abandoned ArgYROKASTRON to Greek forces.

9 British mechanized forces began lightning drive against Italians in Egypt.

Japanese Foreign Minister Matsuoka said that the alliance with Germany and Italy was not made in contemplation of war against the U.S. and that Japan would not make war on the U.S.A. unless the latter was an aggressor.

10 The British gov't announced it would refuse permission for shipment of food to the continent through the blockade.

Great Britain announced credit to China of £10,000,000.

11 The British recaptured Sidi Barrani, advance base of Italian forces in Egypt, taking 20,000 prisoners, including three Italian generals.

Lord Lothian, British ambassador to the U.S., in a Baltimore address read by an associate a few hours before the envoy's death, said that the hope of the future depended on co-operation between the U.S. and the British Commonwealth of Nations, and that with American help the "gangster menace to human freedom" could be ended.

Arrangements for a loan of \$60,000,000 to Argentina by the U.S. Export-Import bank were made, in addition to a previous loan of \$50,000,000 from the stabilization fund; a loan of \$7,500,000 to Uruguay was also authorized.

Election of local officials in all French cities with more than 2,000 population was abolished by decree of Premier Pétain.

12 Pres. Avila Camacho of Mexico directed the head of the Agrarian department to take the necessary steps to give farmers title to the communal lands on which they were working.

13 William S. Knudsen, of the National Defence commission, told the National Association of Manufacturers that he doubted the wisdom of a five-day week in defence industries as it was important that work be rushed with all possible speed.

After a stormy session of the French cabinet Premier Pétain ordered the arrest of Pierre Laval, vice premier and foreign minister, suspected of plotting against the gov't, abolished his office as vice premier and later appointed Pierre-Etienne Flandin as foreign minister.

14 Argentina and Uruguay agreed on the joint defence of the River Plate.

British troops reached vicinity of Egyptian-Libyan frontier and pursued retreating Italians across the border after recapturing Sidi Barrani.

15 The body of the Duke of Reichstadt, son of Napoleon I, removed from Vienna, was deposited in the Invalides in Paris beside the body of his father.

16 Premier Pétain was reported to have refused German permission to send troops through France to embark at a Mediterranean port for the relief of Italy.

U.S. supreme court, in a 6 to 2 decision, ordered the Appalachian Electric Power company to submit to the regulations of the Federal Power commission in the management of its dam in the New river, Virginia.

17 Plan to lend arms to Great Britain without immediate payment announced by Pres. Roosevelt.

18 Pres. Roosevelt vetoed the Logan-Walter bill; a motion to override the veto was defeated in the house of representatives.

Pierre Laval, deposed French vice premier and foreign secretary, was released from arrest and went to Paris after visit of Otto Abetz, German high commissioner in France, to Vichy.

20 Pres. Roosevelt created a new four-man defence council known as the office for production management and defense, with William S. Knudsen as its head.

Italian sources reported German planes were in Italy carrying reinforcements to the Fascist army in Albania.

London announced that a British fleet had made its way through the straits of Otranto Dec. 18 and bombarded Valona, Albania.

21 An official German spokesman said that the suggested seizure of German and Italian merchant ships in U.S. harbours and their transfer to Great Britain would be regarded as a warlike act.

Risto Ryti was sworn in as president of Finland.

22 Philip Murray, president of the C.I.O., proposed a plan for utilizing surplus capacity of motor car factories to produce 500 fighting planes per day after six months.

23 Viscount Halifax was appointed British ambassador to the U.S. to succeed the late Lord Lothian; Anthony Eden was named foreign secretary.

Rear Admiral William D. Leahy sailed from Norfolk, Va., on the U.S. cruiser "Tuscaloosa" to take up his duties as U.S. ambassador to France, the first ambassador to be sent to his post in a warship.

Prime Minister Churchill broadcast a plea to the monarchy, the church and the people of Italy to get rid of Mussolini and resume peaceful relations with Great Britain.

24 Japan and Thailand (Siam) proclaimed a treaty in which each pledged to respect the territorial integrity of the other.

25 Premier Eamon de Valera of Eire (Ireland) appealed to the U.S. for food and weapons.

20 German divisions were reported passing through Hungary and Rumania to the Bulgarian frontier; Russia was reported massing troops on the Rumanian frontier.

26 Unofficial two-day Christmas truce in aerial war between Great Britain and Germany ended by raid of lone bomber over mouth of Thames.

28 About 5,000,000 aliens were listed under the law requiring their registration in the U.S.

29 Pres. Roosevelt, in a broadcast address, said that his whole purpose was to keep the U.S. out of war while supplying to Great Britain and its allies all possible help in the way of shipping, munitions, planes and food; he also said he did not believe the Axis powers would win the war.

The Germans subjected London to one of the severest bombings of the war, dropping incendiary bombs on the heart of the city and causing destruction said to be as great as that from the great fire of 1666.

30 The National Student Federation of America withdrew from association with the American Youth congress because of opposition to the latter's radical tendencies.

31 Pres. Roosevelt sent a New Year's message to King Victor Emmanuel expressing the hope that Italy might enjoy the blessing of a righteous peace in 1941.

The American Red Cross reported it had given \$16,690,000 in cash and supplies to war victims in nine countries.

BOOK OF THE YEAR

Abercrombie, John William

(1866-1940), U.S. educator, was born in St. Clair county, Ala., May 17 and was graduated from Oxford college (Ala.) in 1886. After teaching in schools and colleges, he was made state superintendent of education in Alabama in 1898, serving until 1902 and again occupied the same post from 1920 to 1927. He was president of the University of Alabama from 1902 to 1911 and was elected to congress in 1912, serving two terms. He had been a member of the Alabama senate. At the time of his death in Montgomery, Ala., on July 2 he was supervisor of teachers' certification for the state.

Abyssinia (Ethiopia): *see* ITALIAN COLONIAL EMPIRE.

Academic Freedom.

The major scholarly associations in the United States of a general character have established academic freedom committees. This list, Jan. 1, 1941, included the American Association of University Professors, the American Federation of Teachers, the National Educational association and the Progressive Education association. On Nov. 8, 1940, a revised joint statement of academic freedom and tenure procedures was drafted at a meeting between representatives of the American Association of University Professors and the Association of American colleges, subject to ratification by both organizations in 1941. In the amended formulation the "full freedom" of the teacher "in research and in the publication of results, subject to the adequate performance of his other academic duties," was recognized. It was also agreed that the teacher should have freedom in discussing his subject in the classroom and that "when he speaks or writes as a citizen he should be free from institutional censorship or discipline." An instructor or person of higher rank would normally receive permanent tenure after serving a mini-

mum of seven years at an institution. Seasoned teachers transferring to a new institution would serve a maximum probationary period of four years. Beyond such periods, the termination of appointments would be for "adequate cause" or for extraordinary and proven financial exigencies. Dismissal would be only after a hearing at which the teacher was afforded an adequate opportunity to defend himself.

The American Association of University Professors reported in 1940, 108 cases of alleged violation of academic freedom; the highest number in the history of the organization. Outstanding 1940 cases in which infringements to academic freedom and tenure were found included those at West Virginia university, Central Washington College of Education, the University of South Carolina and Simpson college. The Central Washington College of Education was placed by the association on its list of censured administrations.

Perhaps the most heated controversy of the year centred about the appointment of Bertrand Russell to the faculty of City college, New York, for a two-year term in the department of philosophy. Although Mr. Russell was listed as teaching courses in the interrelationships between science, mathematics and philosophy, objections were brought by citizens against the appointment because of his views upon marriage and politics. On March 30, 1940, Justice McGeehan of the state supreme court upheld a taxpayer's suit to revoke the appointment. Strenuous protests were lodged by scholarly associations, including the American Association of University Professors, claiming a violation of academic freedom. Though an appeal was taken from the decision, Mayor F. H. La Guardia of New York sought to close the issue by eliminating Mr. Russell's salary from the city budget.

The rising hysteria against "subversive influences" in academic circles called forth legislative inquiries into alleged

BERTRAND RUSSELL'S appointment to the staff of the College of the City of New York Feb. 26, 1940, caused a storm of protest from those opposed to his "immorality" and a counteracting defence from the champions of academic freedom

radicalism and led to statements by some college administrators which would tend to limit the scope of academic freedom. At the close of 1940, however, violations of academic freedom were still generally confined to the less prominent institutions. In one extreme case, a professor of modern languages in a southwestern state teachers college was dismissed because he wrote to his representative in congress, expressing his opposition to war and to the then pending selective service bill. (C. E. WA.)

Adams, Thomas (1871-1940), British town planning expert, was born in London, Sept. 10. He studied law, but abandoned it when he became interested in town planning. He planned the first "garden city" in England and on the passage of the town planning act in 1909 he was employed as an expert to pass on planning projects. In 1914 he founded and was the first president of the British Town Planning institute. He became adviser to the Canadian Conservation commission and submitted plans for several Canadian cities. He also made plans for a part of Greater London. He was employed by the regional planning commission of New York and was head of the corps of engineers, architects and draftsmen who made a plan in 1929 covering an area of 5,528 sq.mi. in New York, New Jersey and

Connecticut which Mr. Adams thought should be organized as a separate city state. He lectured at the Massachusetts Institute of Technology and was an associate professor of research in the school of city planning at Harvard university. He died in Battle, Sussex, England, March 24.

Aden. Aden is a British colony, seaport and territory in Arabia, situated in 12° 45' N. and 45° 4' E., including Perim island, etc., in the strait of Bab-el-Mandeb between Africa and Arabia; area 80 sq.mi.; pop. (est. 1939) 48,338. Aden protectorate, including Sokotra on the Red sea coast, 112,200 sq.mi.; pop. (est.) 600,000. Governor: J. Hathorn Hall, C.M.G., D.S.O., O.B.E., M.C. Language: English and Arabic; religion: Mohammedan.

History.—In 1940 the secretariat was unified; there was no longer a civil secretary looking after the colony and a political secretary looking after the protectorate; these two offices were abolished and replaced by a chief secretary to the government. This change took effect on July 1. The finances of the colony and protectorate remained separate; that is, the colony paid its own way and the protectorate was financed by the colonial office. As part of the Aden centenary memorial an infant welfare clinic was opened. Child welfare and ante-natal services were functioning at the close of 1940 and a maternity ward was soon to be opened.

In the protectorate extensive agricultural developments took place, particularly in the production of vegetables of high quality, primarily for use in the colony, but eventually for the supply of ships as well. A beginning was made with road improvements in the protectorate.

After the entry of Italy into the war there were a number of air raids. The damage to property was negligible and the casualties few. This was largely due to the efficiency of the A.R.P. organization, both in regard to alarms and the provision of shelters. Long before the war, the possibility of raids had been foreseen and precautions taken, but the provision of public shelters and of sandbags for private houses was later greatly extended.

A new and important radio station was established in Aden, broadcasting in Arabic; French, Italian and Somali, thus serving the protectorate, British, French and Italian Somaliland and the Italian communities in Eritrea and Abyssinia.

For the convenience of shipping, a contraband control base was also established at Aden. (A. MN.)

Adjusted Compensation. On May 19, 1924, the World War Adjusted Compensation act was passed by the congress of the United States providing for the adjustment of the pay of veterans of the World War. In substance it bestowed basic service credit of \$1.00 for each day's service in the United States and \$1.25 for each day's service overseas, with deduction on account of the \$60 bonus previously authorized and limited to a maximum of \$500 for home service and \$625 for overseas service. If service credits amounted to no more than \$50, veterans were paid in cash, payments numbering 178,035 and aggregating \$5,568,566.37 having been paid under this provision of the statute.

In the case of deceased veterans, service credits were payable to their dependents and such payments amounting to \$49,099,142.26 have been made on 150,602 veterans' cases. To living veterans whose service credits exceeded \$50 there have been issued 3,792,432 adjusted service certificates, the face values of which total \$3,709,945,334.

These certificates having loan privileges are, in essence, paid-up 20-year endowment insurance policies, the maturity values thereof

approximating two and one-half times the service credit. A sum of \$238,364,117 has been paid on 241,804 certificates because of maturity having been occasioned by the deaths of veterans.

Legislation enacted Jan. 27, 1936 made the face values of adjusted service certificates, less any outstanding loans and interest accrued prior to Oct. 1, 1931, payable as of June 15, 1936, upon application. The face values of the 3,509,808 adjusted service certificates upon which certifications have been made totalled \$3,434,940,134, and the amount certified as payable after deducting outstanding liens was \$1,920,288,441.70.

Payment was prescribed by the law to be made by the issuance of bonds of the United States in denominations of \$50, odd amounts in excess of any multiples of \$50 to be paid by checks. These bonds are dated June 15, 1936 and mature on June 15, 1945, but are redeemable at the option of the veteran at any time, interest accruing at the rate of 3% per annum except no interest accrued on bonds redeemed prior to June 15, 1937. In settlement the treasury department has issued to veterans bonds totalling \$1,837,010,500 and has redeemed \$1,575,980,650 of these bonds. The adjusted compensation work has to a large extent been completed, certification having been made on all certificates issued up to this time with the exception of 40,820 for which applications for settlement have not been received from veterans. All data herein cited are as of June 30, 1940. (See also VETERANS' ADMINISTRATION.) (F. T. Hr.)

Adjusted Service Bonds: see ADJUSTED COMPENSATION.

Adler, Cyrus (1863–1940), U.S. educator, was born in Van Buren, Ark., Sept. 13 and died in Philadelphia, Pa., April 7. For a biographical sketch see *Encyclopædia Britannica*, vol. 1, p. 168.

Adult Education: see EDUCATION, ADULT.

Advertising. Unsettled world economic conditions, a presidential election and broader government surveillance of industry were important aspects of advertising development in the United States during 1940. The war continuing in 1940 dominated advertising activity in the United Kingdom. Advertising volume in Great Britain dropped 50% or more, accelerated during the six-month period following the invasion of the Low Countries. During the same six-month period, advertising rates rose approximately 25%. Advertising volume in the United States was \$1,648,500,000 in 1940, an increase of 2.9%. Newspaper linage increased 1.9%; radio, 15%; magazines, 4.6%; outdoor, 3.4%. Farm paper linage decreased 2.0%. Direct mail advertising volume remained practically the same as 1939. These estimates were based upon a study for the publication, *Printers' Ink*.

Copy and Layout.—U.S. advertising writers faced new problems in creating good selling copy in compliance with provisions of the Wheeler-Lea and the Food, Drug and Cosmetic acts. The picture-caption treatment, the continuity strip and the story methods of presenting advertisers' messages continued among the leading forms of technique. Humour was widely used. The war, national defence program and presidential election introduced into copy themes a new consciousness of U.S. ideals, institutions and U.S.-made products. Greater dramatic effects were achieved in layout by increased use of photography, particularly colour photography in magazines.

In Britain, the order to conserve newsprint imposed by the ministry of supply, which drastically reduced the number of pages in newspapers, affected copy and layout. Copywriters turned to short phrases and slogans, while layout men had to make

ingenious use of small space. Copy themes were built around new arguments why products were good in wartime. Many advertisers of products such as motor cars, whose sales were controlled by government restriction or rationing, continued advertising to keep their brand names alive, but devoted their space to institutional and patriotic messages. Advertisers of such products as gasoline, motor oils, tea, margarine and others subject to government pooling and control discontinued advertising completely.

Newspapers.—*PM*, a five-cent daily newspaper of tabloid format was started in New York city on June 18 with no advertising, but contained a digest of advertising in other media as a service to readers. The 1940 local-national rate differentials study of the Association of National Advertisers, Inc., showed continuing expansion of the national rate over the local rate. The number of newspapers offering run of paper in colour increased. Basic Newspaper Group, Inc., was formed to restore newspapers as basic media and to promote the sale of space on long-term contracts with discounts similar to radio networks.

Newsprint prices doubled in Britain. To conserve paper, the ministry of supply limited national dailies to 6 pages, tabloids to 12 and the *London Times*, a two-penny paper, to 8. Weekly, Sunday and provincial papers were similarly limited. Circulation was held to levels prevailing in June and no new papers could be started without government permission. This ban was lifted for new Polish, French and Dutch dailies subsidized in some instances by their governments for the free peoples of these countries residing in Britain and abroad. Largest newspaper space purchasable was generally reduced to eight inches on two columns. As the year progressed, no rate schedules, preferred positions or insertion dates could be guaranteed. (See NEWSPAPERS.)

Radio.—Advertisers in the U.S. spent \$200,000,000 for time on radio stations in 1940 and there were about 52,000,000 radio sets in use. In June, the Associated Press approved full commercial broadcasting of news. During the year, the Federal Communications commission gave the go-ahead signal to FM (frequency modulation) a new type of high-frequency broadcasting which involves the purchase of a new type of home receiving set, new types of transmitters by broadcasters, makes more stations possible than the 550- to 1600-kilocycle band permits, and provides staticless reception. There was a trend toward more sponsored quiz-type programs. One large U.S. broadcasting company began aggressive promotion of sponsored commercial, short-wave programs to Latin America. Eight U.S. advertisers were using this service. Development of Latin American service was hastened by new interest in western hemisphere solidarity and the opportunities offered to offset short-wave propaganda from European countries. British commercial radio advertising was virtually nonexistent in 1940. The government-owned BBC has never permitted sponsored commercial programs and the two principal radio sta-

NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

tions on the continent which accepted commercial programs for British advertisers, ceased to operate due to the war. These were Radio Normandy and Radio Luxembourg. Effort was made for commercial broadcasting over an Irish station.

Magazines.—The Magazine Marketing service was founded in March. This will be supported by all national consumer magazines to promote magazines as an advertising medium and to serve advertisers, agencies and publishers as a clearing house for factual data on marketing, sales and advertising. (See MAGAZINES and PERIODICALS.)

Outdoor.—Measurement of outdoor circulation by the Traffic Audit bureau was extended as a requisite to all members of the Outdoor Advertising association. This brought about an improvement in outdoor plants and an audited circulation increase of 7.5%, comparing the year 1940 with 1935. Poster advertising moved ahead with the growth of the self-service grocery business from 1% in 1930 to 35% in 1940, a development which influenced the importance of product and label identification of nationally advertised food products.

Films.—United States advertisers gave greater attention to commercial films. About 10,000 theatres out of 17,000 wired for sound Jan. 1, 1940, would accept short advertising playlets running 40 to 80 seconds. This offered a medium with 43,000,000 weekly circulation. High hopes for 1940 film advertising in Britain were dashed because of the inability of cinema managements to guarantee contracts due to black-outs and bombings.

Point-of-Purchase Advertising institute was founded to establish window and internal-store display as a definite advertising medium with factual data to prove its effectiveness.

Carcards.—Innovations in this medium included a new space offer of 11 by 28 inches at the same rate as the old standard offer of 11 by 21 inches.

Television.—Colour television was successfully demonstrated in 1940. The first sponsored news series designed for television was telecast in March. The year looked bright for television until a rule permitting restricted commercialization to become effective Sept. 1 was suspended by the Federal Communications commission.

Rotogravure advertising in the United States decreased 2.6% in 1940.

Consumers.—The consumer movement showed less antagonism and a willingness for co-operation on both sides. Harriet Elliott was appointed commissioner in charge of the consumer protection division of the National Defense Advisory commission. A committee on consumer relations in advertising was incorporated Jan. 5, 1940, to engage in fact finding and research on the economics of advertising and consumption. In April the Institute of Standards, Inc., was founded as a co-operative solution to problems resulting from the consumer movement.

Co-operative Advertising programs included a wide range of products, services and educational promotions. Among the largest was the \$2,000,000 campaign of the Institute of American Meat Packers. State and community programs were used extensively to capitalize on the "See America First" movement. Thirty-seven out of 48 states had in 1940 state appropriations for promotional advertising.

Financial Advertising.—A new experiment in the history of financial advertising was started by the firm of Merrill Lynch, E. A. Pierce & Cassatt to dramatize its services in display space similarly to methods successful in other business.

Political Advertising in the 1940 U.S. presidential campaign displayed a more professional tone and more selling punch, presented with careful layout and illustrative technique. Radio took \$2,500,000, largest share of the election budget; newspapers, \$2,000,000. Outdoor, poster, displays, direct-mail and magazines accounted for the remainder. Many advertising executives participated actively. The *Christian Science Monitor* accepted political advertising for the first time in its history.

Research.—The accuracy with which market research polls forecast the 1940 election proved a point for the accuracy of advertising research methods in general. The 16th decennial census, taken in 1940, was a new aid to market information. An analysis of the people of the United States from the viewpoint of the family as a buying unit was completed by the publication *Printers' Ink*. The Bureau of Advertising of the American Newspaper Publishers' association and the Advertising Research foundation continued its joint study to determine current newspaper reader habits. The "eye camera," a photographic device for determining what people look at on a page of print and pictures, was a research experiment of the year.

Legislation.—The charge by the Federal Trade commission that the use of the *Good Housekeeping* "Seal of Approval" violated federal legislation continued in the spotlight of legal actions against advertisers in 1940. Five months of hearings in Washington, Chicago and New York were completed in July as the last of 160 witnesses completed testimony on a 6,900-page record. The American Newspaper Publishers' association intervened in the proceedings, claiming the case raised fundamental issues affecting the constitutional guaranty of a free press.

Passage of the first national labelling law, calling for correct labelling of wool products, marked a continuance of the government's attitude toward consumer protection.

Regulation and Ethics.—The department of justice filed a charge under the Anti-Trust act against eight tobacco manufacturers, claiming their vast advertising and promotional activities created a demand for products under brand names which forced wholesalers and retailers to handle such products on arbitrary terms.

A concern of radio advertisers was the controversy over the renewal of a contract involving royalties between ASCAP (the American Society of Composers, Authors and Publishers) and the broadcasting companies. The result was a boycott of ASCAP music on the airwaves and the formation by the National Association of Broadcasters of BMI (Broadcast Music, Inc.) to encourage broadcasting of non-ASCAP music.

In October the commercial section of the National Association of Broadcasters put into effect a code limiting time for commercial copy and clarifying "accepted standards of good taste."

Successful new contracts were signed between radio networks and the

American Federation of Radio Artists regarding wage scales, for both sustaining and sponsored programs to run concurrently until Nov. 1, 1943.

Direct Mail Advertising association endorsed a campaign to free United States mails of foreign propaganda injurious to America and its institutions.

Retail Advertising.—Department store advertisers paid more attention to institutional programs, a trend traceable to problems in retail merchandising arising from decentralization of population and competition from other retail sources. Retailers became more research and consumer conscious. Radio gained a more conspicuous place. The U.S. as the world fashion centre provided new material for copy themes. More attention was paid to point-of-sale advertising.

War and Advertising.—According to a trade paper survey, the budgets of the largest advertisers in the U.S. were unchanged by the war. Advertising associations adopted such themes as "Make America Strong," and pledged co-operation to the government in the national defence program.

In Britain, advertising continued in considerable volume for products not greatly affected by government restrictions and which had "relief" and "escape" appeals, such as cigarettes, soap, liquors, cosmetics, beauty preparations, household aids and sweets. Advertising agency and publication offices were decentralized into units in different sections, so that if one were bombed, activities could go on in the others. Most newspapers and magazines continued and the war gave added interest to magazines of picture type. All available advertising media were put to use, due to the newsprint shortage. Export advertising took on new significance because of the government drive for foreign exchange. The *Hansard*, official publication of the British parliament, carried advertising for the first time to publicize war bond sales. The British government made wide use of newspapers, magazines, posters, billboards, films and radio in its efforts for recruiting, air-raid precaution work, food conservation, war financing and maintaining morale. Government programs were handled through British advertising agencies.

United States Army Advertising.—An appropriation of \$250,000 was made for an army recruiting program principally in newspapers. The army recruiting publicity bureau turned out posters, carcards and other publicity at the rate of 13 tons a month for distribution to 550 recruiting stations and substations. Eighteen mobile recruiting stations also distributed this material. More than 750 radio stations carried daily recruiting announcements, in addition to special dramatizations. All movie companies co-operated with at least one short devoted to recruiting or preparedness. The war department asked 100 trade associations to devote space to the recruiting drive. Local recruiting officers persuaded retailers to include appeals in their advertising.

Contests and Premiums.—These advertising adjuncts continued their popularity in 1940. On one major network, approximately 52% of the commercially sponsored programs featured inducements of various kinds. (See also PSYCHOLOGY, APPLIED; RADIO, INDUSTRIAL ASPECTS OF; RADIO, SCIENTIFIC DEVELOPMENTS OF.)

BIBLIOGRAPHY.—Among the 1940 books on advertising and related subjects were: Business Publications, Ltd., *Advertisers' Annual, 1940* (London); *Art Directors' 18th Annual of Advertising Art*; W. C. Briggs, *The Camera in Advertising*; F. A. Burt, *Successful Advertisements and How to Write Them*; Harwood L. Afghanistan. A Muslim kingdom lying between India and Persia; area 250,000 sq.mi.; pop. (est. 1937) 10,000,000; chief towns: Kabul (80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Muhammad Zahir Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

History.—Peace and progress were maintained during 1940, the 21st year of Afghan independence, but when the king reiterated, in August, his declaration of neutrality, he stressed the necessity of being prepared and united in view of current external events. Toward this end obligatory national service for all males over 17 had been decreed in January, and special taxation imposed for the purchase of arms from abroad and the construction of two radio stations and three railway lines.

A trade agreement with the U.S.S.R. was signed in July, under which Afghanistan exchanges wool, casings, skins and herbs against textiles, salt, sugar and kerosene; while internal economic development was furthered by increasing the availability of land

for cultivation, by assistance to the sugar-beet industry, and by official sanction of a scheme for the formation of a joint-stock company to co-ordinate the work of the country's cotton pressing, spinning and weaving factories. Archaeology benefited by the discovery early in the year of the long-buried city of Begran, the ancient capital at the time of the Greek domination, by the French research expedition (withdrawn in July) under Professor Josef Hackin.

Education.—Confined chiefly to Kabul. Elementary schools exist throughout the country, but secondary schools exist only in Kabul and provincial capitals. Both are free. There were in 1940 130 primary schools and one normal school for teachers in Kabul. In addition there were 4 secondary schools and 13 military schools. Technical, art, commercial and medical schools exist for higher education. The Kabul university was established in 1932; only a medical faculty existed in 1940.

Army.—Compulsory service; peace strength 60,000.

Finance.—Revenue and expenditure about Rs. (Afghan) 150,000,000; currency: Rs. 3.95 (Afghan) = Rs. 1 (Indian). Rs. 1 (Afghan) = 5d. approximately.

Agriculture. The Food Crop Situation.—The year 1940 in the U.S. was a very good crop year. The index of yields of 28 crops was 18.5% above normal, the highest in history. In fact, the United States has had good crop yields for the last four years. Corn is the most important grain crop of the U.S. Based on the December estimate, the United States yield was 28.3 bu. per acre for 1940 (Table I). This was less than the unusually good 1939 crop, 29.4 bu. per acre. There have been

*Based on the December estimate.

four consecutive years of good corn yields, averaging 28.5 bu. per acre. This is the same as the best four consecutive years of

the early '20s, 28.5 bushels.

The average yields since 1936 for wheat, oats and barley were better than in the best four consecutive years of the early '20s but slightly less than the good yields of the four consecutive years 1912-15. Hay yields were about the best in history.

Acreage and Production.—Since 1936, acreage of 46 crops harvested in the United States totalled 334,000,000 ac. This is about 5% less than in the early '20s. During this time, population increased 20%.

As a result of changing acreage and yields, the production of corn, oats, rye and buckwheat in the late '30s was less than in the early '20s; whereas the production of wheat, barley, flaxseed, rice, hay, beans, potatoes and soybeans was somewhat greater.

The production of 22 field crops increased from an index of 98.2 in the early '20s to 104.1 in the last four years (Table II). When fruits and vegetables were added to the field crops, the

Table II.—Crop Production in the United States

index of production increased from 96.2 to 107.5. Stated another way, the production of 22 field crops increased 6%; and of 53 crops, 12%. During this time, the production of six grain crops declined about 10%; and population increased 20%.

Livestock, a Shock Absorber.—During the last four good crop years, there has been an accumulation of stocks of wheat and corn.

Normally, following good crop years, stocks of food accumulate in the form of more animals and/or heavier animals, more dressed meats in cold storage and some surplus grain and hay carried over into the next years. In poor crop years, animals are liquidated and/or become smaller, and cold storage holdings and surplus feeds disappear. In this way, farmers have always assured the public of a reasonably stable food supply.

This was well illustrated during the dry years of the early '30s. There was not sufficient grain for both man and beast. Food was

Fig. 1.—INDEX NUMBERS OF THE PHYSICAL VOLUME OF CROP PRODUCTION PER CAPITA AND OF TOTAL AGRICULTURAL EXPORTS OF THE UNITED STATES, 1880-1940. From 1880 to about 1915, there was a tendency for the production of crops per capita to increase slightly. Since that time, they have declined. The physical volume of exports rose to about the turn of the century. Thereafter, a decline set in and continued to 1940. The only interruption was during and immediately following the war of 1914-18

"TO BE CONSIDERED WITH crop-control" in 1940, by Temple in the *New Orleans Times-Picayune*

made available by reducing inventories of grain and hay and live-stock, and by feeding less to the livestock remaining. The amount of food made available to the consumer through liquidation of inventories was greater than the grain saved by the decline in meat production caused by the decreased rate of feeding.

Conversely, during the last four good crop years, surplus hay, grain and pasture were stored in the form of more animals and heavier animals. During this period, the farm stocks of sheep, hogs, cattle and chickens have increased. Farmers have also re-established their normal stocks of grain. Under normal conditions, most of these extra accumulations of feeds would have found their way into still more and/or heavier livestock.

In times of war, large stocks of food in the form of many animals of heavy weights on the hoof and in cold storage warehouses are much more valuable than corn in the crib and hay in the mow. A soldier consumes more food and much more meat than a civilian.

Foreign Trade and Agriculture.—The two decades of falling prices since the war of 1914-18 played havoc with economic, social and political relationships between man and man, state and state, and nation and nation. Such a great collapse in commodity prices called for an explanation. Some persons turned to money; others, to overproduction; and still others, to the U.S. foreign trade policy. Many persons believe that the low level of farm prices was due to the loss of the foreign market.

From 1880 to about 1915, there was a gradual increase in the physical volume of crops produced per capita in the United States. Since the war of 1914-18, there has been a steady decline (fig. 1). Prior to 1900, U.S. agricultural exports fluctuated about production. Beginning about 1900 and particularly since 1920, agricultural exports have declined at a rapid rate and in 1940 were relatively unimportant.

Importance of the Export Market.—In the case of tobacco and cotton, the foreign market is important. However, the impor-

tance of the export market to U.S. food producers is generally overemphasized. In 1885, exports of food represented 6.7% of the total income that farmers derived from sales of food. Fifty years later, 1935, this proportion declined only 1.8%. This is well illustrated by analyzing the production, consumption and exports of a few crops and of meats.

Production, Consumption and Exports of Beef and Wheat.—Since the turn of the century, there has been a pronounced decline in the per-capita production of beef (Table III). Produc-

Table III.—*Production, Consumption and Exports of Beef, U.S., 1899-1938*

*Not including live cattle.

tion has declined from about 75 lb. to about 50 pounds. Consumption also declined, but not so rapidly as production. Consequently, during that period, net exports disappeared and for about 15 years the United States has been importing beef.

Formerly the United States produced about 8 bu. of wheat per capita and produced in 1940 about 5 or 6 bu. (Table IV). With

Table IV.—*Production, Consumption and Exports of Wheat, U.S., 1914-38*
(bushels per capita)

Five-year period	Production	Consumption	Net exports	Per cent of crop exported
1914-1918. . .	8.1	6.0	2.3	28

1929-33. . .	6.4	5.6	0.7	11
1934-38. . .	5.6	5.3	0.3	5

consumption reasonably stable, exports declined. Formerly, exports of wheat represented about a quarter of the crop and were in 1940 negligible. With the tendency for the population to increase faster than production, it seems reasonable to assume that the United States will only export wheat in very large crop years.

The production of pork has declined from about 80 lb. to about 60 lb. (Table V). With consumption reasonably stable, exports have declined from about 13% of production to practically nothing.

Table V.—*Production, Consumption and Exports of Pork, U.S., 1899-1938*
(pounds per capita)

1924-28. . .	73.3	69.2	4.3	6
1929-33. . .	71.2	69.1	1.7	2
1934-38. . .	56.7	56.1	0.5	0.9

The same general situation is typical of many other food products. The United States has lost its export market for food because there is no surplus to sell—and not, as is generally assumed, because of some foreign or domestic policy.

Food Imports.—Prior to 1923, the United States generally produced more foods than it consumed and some were exported. The relative importance of food exports began to decline about 1900 and, just prior to the war of 1914-18, was negligible. This downward trend was interrupted by the war of 1914-18. However, since 1923, total food production has been less than consumption and increasing net imports have prevailed (fig. 2).

During 1936, net imports of food amounted to 5% of production. Barring wars, there is little likelihood that, in the future, the United States will export much food. On the other hand, food imports are likely to increase.

Possible Food Exports During War.—The failure of U.S. food production to increase with population since 1920 resulted in a decrease in exports and an increase in imports. In view of these facts and the world situation of 1940, the question naturally arises as to whether the United States could suddenly meet an increased demand for food.

During the last four good crop years, United States food imports exceeded food exports. For exports to exceed imports, it would be necessary to increase production about 3% above the last four good crop years. To export the 1916-18 quantities of food would mean a 7% increase in food production. But suddenly to increase food production 7% above that of the last four good crop years would be practically impossible.

If the United States is called on for such exports, they will not come from huge food surpluses that are assumed to exist, or from increased production, but from decreased food consumption in the U.S.A. (F. A. P.E.)

Agricultural Planning.—Organized planning for agriculture took on added significance during 1940. The changes that occurred in world conditions placed U.S. agriculture in a new economic environment. It became evident that the effects of the European war would assume increased importance in the determination of policies, and that significant changes in agricultural programs might be needed.

With a view to guiding such changes as effectively as possible without sacrificing democratic ideals, agricultural planning in 1940 was featured by an intensification of the co-operative land-use planning work begun in 1938 under the joint leadership of the department of agriculture and the land-grant colleges. This work is carried on through community, county and state land-use planning committees composed of farm men and women, agricultural technicians, and administrative officials of public agencies. These committees provide a means whereby all persons directly interested in agriculture may combine their knowledge and judgment, and may share responsibility in the development of policies to guide agricultural plans and programs.

Under the stimulus of increased responsibility, and with the benefits of the experience gained in 1938 and 1939, the land-use planning work progressed rapidly during 1940. Previously, the work had been restricted largely to the gathering of information concerning the conditions and problems in various areas as a necessary step toward the development of sound plans for action. During 1940, however, the work developed in many counties to the point where specific local plans for action, formulated by land-use planning committees, were being carried out either by co-operating groups of farm people or by administrators of the various federal and state agricultural programs. At the same time, the influence of land-use planning work was extended beyond the locality. Whereas tangible results were formerly restricted almost wholly to local adjustments in the operation of agricultural programs, accomplishments in 1940 included important changes in national programs.

The improvement in the operation of state land-use planning committees was an outstanding feature of the progress made during 1940. Many of the members of state committees travel long distances to attend the meetings, and, as a result, meetings have been relatively infrequent. This, together with the fact that the problems considered by these committees are more complex than those studied at the county and community levels, has made their work more difficult. However, the state committees met more frequently in 1940 and developed procedures

Fig. 2.—VALUE OF NET U.S. EXPORTS OR IMPORTS OF FOOD IN PER CENT OF FARM INCOME, 1882-1939. From about 1890 to about 1900, net exports mounted relative to production. From 1900 to the war in 1914, the excess of exports vanished. During the war of 1914-18, there was an excess of exports of food. Since 1923, imports of food have exceeded exports; and in 1936, were 5% of farm income. Even after four relatively good crop years, about 2% more food was consumed than produced

which should enable them to utilize more effectively the services of technicians in bringing together the information needed in their work. (B. W. A.)

Great Britain.—A general plan for the reorganization of British farming in the event of war had been prepared in advance. This plan envisaged a general intensification of food production by such measures as improved drainage, better tillage and the use of more fertilizers; a reduction in the output of costly luxury foods (prime beef, lamb, eggs, etc.); and an increase in the production of crops that give high yields of nutrients per acre—cereals, potatoes and vegetables. Dairy herds were singled out for preferential consideration.

By Jan. 1940, through the agency of the County War Agricultural committees, the first stage of the plan had been applied throughout the country. The main object of the 1940 program was the conversion of 2,000,000 ac. of grassland to arable crops. The selection of the fields had mostly been made before the turn of the year. There had, however, been some delay in securing the necessary tractors and implements, and the autumn of 1939 had been unfavourable for wheat sowing. By the time the equipment was at hand (much having been bought from America) the soil was frostbound. When the frost eventually broke, in early March, it seemed that the fulfilment of the season's program had become impossible.

A dry spring followed the hard winter, however, and unprecedentedly rapid progress was made with spring tillage and seeding. Excellent tilths were made even out of tough sod and stubborn clay soil. Some of the seed went late into the ground but very little was ill sown, and the 2,000,000 ac. program was completed with something to spare.

In southeastern England the early summer was too dry for pastures and meadows, and also for arable crops on the lighter soils, but taking the country as a whole, there were excellent crops of wheat, potatoes and sugar beets, and no important crop was worse than middling. Moreover the hay, though the yield was light in places, was secured under good conditions; and the fine hay season was followed by a perfect corn harvest.

Rain came too late in the south and east to produce much autumn growth. The scarcity of grass was reflected in a reduced milk supply during October and November. Meanwhile the plows were at work again upon a further 2,000,000 ac. of grassland for the harvest of 1941. Autumn conditions were favourable for wheat sowing and a large increase in the wheat area was achieved. Supplies of fertilizers were well maintained.

It had been foreseen that normal imports of feeding stuffs for livestock—nearly 25% of the total food requirements of British herds—would not be available in time of war. It was clear that

BRITISH FARMERS plowed at night in the spring of 1940 to cultivate 2,000,000 new acres for wartime food supplies

these herds would have to be reduced and that pigs and poultry should be sacrificed first, since these animals live on grain rather than on grass. Before the end of the year the government decided upon a livestock rationing scheme as a means of enforcing the necessary reduction. Under this scheme, which was brought into force in Feb. 1941, pig and poultry keepers were allowed only one-third of their prewar feeding stuff supplies.

The Empire.—While the home farmer was faced with the problem of producing more food with smaller resources in the way of imported raw materials, the farmer in the dominions was faced with a difficulty of quite another kind—that of disposing of his produce. Canada grew an embarrassingly large crop of wheat and her farmers had to turn pig-keepers in order to “condense” their surplus wheat into bacon. The long haul from Australia and New Zealand made it essential that these countries should turn to still more highly condensed products; butter, cheese and milk powder continued to be worth their ship-room, but meat exports had to be curtailed and little fresh fruit could be shipped. In general, of course, considerable quantities of perishable food outside the war zone were going to waste and large surpluses of non-perishable materials—wheat, maize, oil-seeds, canned foods and even dried fruits—were piling up. Storage space was inadequate.

(J. A. S. W.)

For agricultural statistics of countries other than the U.S.A. see the subheading *Agriculture* in the articles on those countries, also the articles on various crops and agricultural products. (See also ALFALFA; CHEMURGY; CORN; DROUGHT; DRY FARMING; DUST STORMS; FARM INCOME; FARM MACHINERY; FARM MORTGAGES; FERTILIZERS; HAY; HORSES; IRRIGATION; LAW (CASE); *Agriculture*; OATS; PRICES; WHEAT; etc.)

Air Conditioning. Stimulated by favourable business conditions, the sales volume of the industry showed in 1940 about a 30% increase over 1939. The United States continued to be the world centre of air conditioning activity, although South America and the West Indies were active. Apparently an air conditioning consciousness is being awakened in certain of the countries at war, through the necessary conditioning of the air in certain bombproof shelters.

Air Conditioning Technique.—There were no new and radical developments in the art of air conditioning during 1940. How-

ever, the year was marked by a definite further advance in the packaging of equipment, in order to simplify the installation problem. A healthy increase occurred in the sale of room coolers of the self-contained or package type. The designs were relatively simpler to install than those of 1939 and more slightly in appearance, as well as less likely to give trouble. Each of these little units has from one-third to three-quarters of a ton of cooling capacity (one ton of cooling capacity is equivalent in cooling effect to the melting of one ton of ice in 24 hours), and one unit of proper capacity will handle the average single office, bedroom or living room.

Also in 1940 there was a noticeable slackening of central plant activity in the smaller capacities, such installations more preferably going to the unit conditioner or “store cooler” as it is called. Such units were available up to 10 tons’ cooling capacity, complete with built-in automatic control and special air diffusion heads of such design that the pattern of the delivered air may be adjusted to exactly fit the conditioned space, to give even and relatively draughtless air distribution. Thus it is possible for the owner of the small shop, restaurant or theatre to obtain the benefits of air conditioning at a relatively small investment and in most cases without the use of cumbersome and expensive built-in features, such as duct systems.

A noticeable increase in the acceptance of winter air conditioning as a part of better living, developed during 1940. Package cooling equipment, such as the room coolers and store coolers mentioned above, was in many instances made available for winter circulation and filtering of air as well as ventilation. The larger store coolers are often installed with heating and humidifying accessories, to give year ’round air conditioning.

The sale of automatic winter air conditioning equipment for homes increased tremendously during 1940. A large proportion of all the new homes built, particularly in the medium price brackets, used winter air conditioning systems.

Physiological Benefits.—The investigation and development of the benefits of air conditioning to health, continued, particularly with regard to reducing the bacteria count in the conditioned air. For example, it has been shown that a proper filtering of the air will at the same time reduce the bacteria in the air,

AN AIR-CONDITIONING SYSTEM with a cooling capacity equal to that of the "Queen Mary" is installed on the streamlined Mississippi river excursion boat "Admiral" which went into service in the summer of 1940

thus tending to avoid bacterial concentrations which would be greater than normal body immunity could successfully combat. It is well established that air conditioning usually provides relief for sufferers from hay fever and pollen asthma. (See also PUBLIC HEALTH ENGINEERING.) (EL. HA.)

Aircraft Carriers: see AIR FORCES: Navy; NAVIES OF THE WORLD.

Air Forces. Army.—The year 1940 marked the further expansion of the United States army air corps. In 1909, the Wright brothers had delivered to the United States Army the world's first military aeroplane. In 1939, on the 30th anniversary of the event, was inaugurated the greatest peacetime expansion of the air corps in the history of the United States. Congress authorized and appropriated \$302,000,000 for the purpose. In 1940 congress authorized and appropriated \$2,385,668,570 (including the 3rd Deficiency bill of Oct. 8, 1940) for further expansion.

The program for the fiscal year 1940 called for 5,500 aeroplanes, 11 air bases, 8 bombardment groups, 5 pursuit groups, 6 reconnaissance squadrons and approximately 9,500 officers and 95,000 enlisted men.

The 1941 fiscal year program called for a tremendous increase. More than 18,000 additional planes had to be ordered and the strength of the air corps brought to a total of approximately 16,000 officers and 160,000 enlisted men. Sufficient new bases were needed to house an increased G.H.Q. air force consisting of 54 groups. By the fall of 1940 orders for the aircraft had been placed, the rate of personnel procurement and training greatly increased, and approximately 50 new bases selected with more to be chosen.

The groundwork for training of personnel was laid in 1939 under the 1940 program when nine established civilian flying schools and seven civilian mechanic schools were selected for training air corps personnel. In 1940 the number of civilian flying schools was increased to a total of 18 and the total capacity tripled. This necessitated the establishment of two new air corps training centres, one at Maxwell field, Ala., and the other at Moffett field, Calif. The civilian mechanic and technical training schools were increased to 14. In addition, training facilities at the three air corps technical schools, Chanute field, Rantoul, Ill.; Lowry field, Denver, Colo. and Scott field, Belleville, Ill., were increased to handle a larger volume of students. In addition to these schools a school for navigators was opened at Miami, Fla., with another to be opened at Barksdale field on Feb. 15, 1941. A school for the

training of bombardiers was also to be opened at Barksdale field on the same date.

As the calendar year 1940 closed, pilots were being trained at the rate of 12,000 a year and technicians at the rate of 53,000 a year. When the bombardier and navigator schools opened they would be equipped to train these men at the rate of 3,500 a year. (See also ARMIES OF THE WORLD.) (H. H. A.)

Navy.—The bureau of aeronautics, during the fiscal year 1940, continued, and accelerated wherever possible, the development, procurement and maintenance of aircraft in accordance with the requirements of the navy. When this procurement of aircraft was authorized by the congress, the navy was fortunately in a position to undertake the expansion without reducing the quality of the aircraft. Shore facilities to support the operating aircraft continued to be developed under the broad program laid down by the Hepburn board. On the recommendations of this board, the 76th congress had authorized funds for initial construction.

Eighteen aircraft carriers were, in 1940, either on hand, under construction or authorized. Those in commission were, in 1940, the "Saratoga," "Lexington," "Ranger," "Yorktown," "Enterprise" and "Wasp." Those under construction were the "Hornet," "Essex," "Bon Homme Richard," "Intrepid" and "Kearsarge."

During the fiscal year 1940, approximately 1,300 aeroplanes were ordered to replace those in service which became obsolete or which had been lost due to crashes, as well as to increase the naval aeronautical organization in accordance with the Naval Expansion act. At the end of the fiscal year, June 30, 1940, the navy had on hand approximately 2,200 aeroplanes.

All combatant ships of the navy, with the exception of destroy-

MAJ. GEN. ARNOLD of the U.S. army air corps described this Lockheed interceptor as "the world's fastest" when he released its performance statistics for the first time Aug. 22, 1940. Its top speed exceeds 500 m.p.h.

ers and submarines, carry their own complements of aeroplanes, varying in number from 2 to 3 on the battleships to approximately 75 on each of the aircraft carriers. The types of aircraft are determined by the missions of the surface ships to which they are attached.

The requirements for carrying out these missions have brought into being aeroplanes possessing mechanical features and capabilities that differ greatly from aeroplanes operated by land-based military forces and by commercial aviation establishments. Continuous efforts were being made in 1940 to keep at a minimum the number of types by designing each type to perform the maximum number of functions. The following is a brief description of these basic types:

(a) The fighting plane represents the maximum in performance, manoeuvrability and gunnery; is small and high-powered; and its primary mission is that of attacking enemy aircraft with gunfire.

(b) The torpedo and bombing planes, the largest type employed on the carriers, are designed to attack enemy heavy vessels or shore bases. An important type under this classification is the dive-bomber, which, as its name suggests, delivers its attack in a vertical or near-vertical dive on its objective, either ashore or afloat.

(c) The scouting and observation planes require speed, range, good gunnery defence and excellent facilities for radio in order to accomplish

their missions of scouting for the cruisers and carriers and observing for the battleships.

(d) The patrol plane is the largest type in service in the navy, its size being necessitated by the fact that the craft must be capable of great range, be seaworthy, and be sufficiently habitable to permit operating for protracted periods independent of its base. In addition, the patrol plane must be self-protecting while carrying out long-range strategic scouting flights, and must be capable of joining the fleet at any time.

Development has been pressed on improved engines in order to obtain greater power, better installations from an aerodynamic standpoint, and more efficient performance with safer fuels. The necessary equipment was in 1940 being actively developed to take full advantage of increasing ranges, altitude and other aircraft performance, and to promote the general efficiency of naval aircraft.

(J. H. Ts.)

The World.¹—On Jan. 1, 1940 the European war which began in 1939 was already four months old. Contrary to prediction, a "total" air war had failed to materialize. Except during Germany's drive against Poland, none of the combatants had employed his air force at anywhere near full strength. None seemed willing to show his hand. Each played a waiting game, sizing up the strength of the opposition, meanwhile pushing factories and training centres to the limit to produce new planes and new pilots. As for any positive evaluation of the aeroplane as a weapon in modern war, the year 1939 ended on an interrogation point. Questions debated by air strategists for a decade had not yet found answers. No conclusive data had come out of prior experience in China, in Ethiopia, in Spain, or even in Poland. Nowhere, up to that time, had opponents of near-equal air strength come to grips.

The Douhet theory still provided subject for argument. Over 15 years before, this Italian general had postulated that great masses of bombers flying in close formation for mutual protection could successfully attack cities and industrial areas far behind front lines, could break down an enemy nation's will to resist by destroying its sources of supply and by terrorizing whole populations. But whether Douhet was right or wrong was not proven by the events of the fall of 1939.

Then, too, there was the perennial problem of aeroplane versus battleship. No one had any notion as to how effective air power might be in blockading seaports or in disrupting ocean-borne commerce. Also, as yet untried were defensive measures against massed air attack and the elaborate systems that had been planned for protecting civilians against bombardment. As 1940 closed,

¹All assertions or opinions contained in this section of this article are the private ones of the writer and are not to be construed as official or reflecting the views of any government service.

THE LARGEST BOMBER in the world received its finishing touches at Santa Monica, Calif., in 1940. It can take off with a gross weight of 164,000 lb. and fly nonstop from the United States to Europe and back

however, enough theory had been put into practice to yield some indication as to what would be written down when the books on air strategy and tactics of the European war are finally written.

In the first place, the Douhet theory appears to be at least partially sound. It seems to work in cases where air superiority on one side is overwhelming. Russia employed it successfully against Finland early in 1940. Germany cleared the way for her swift moving ground divisions in Poland, in Norway and in the Low Countries by blasting the opposition on the ground with hordes of bombers. With the wanton destruction of Rotterdam, Germany served notice as to what she could and would do.

When the final scores are added up, it will probably be clear that France was lost, not because of any lack of valour on the part of her front line troops and squadrons, but rather because her forces in the field were cut off from bases, from information and from needed supplies by the German *luftwaffe*. By constant hammering at aerodromes, factories, railheads and supply depots from the channel to the Mediterranean, French industrial and economic life was completely disrupted days before the final surrender. The French air force, weakened by the short-sighted policies of the French governments of the preceding five years, was powerless to resist, and at that stage Great Britain was in no position to give adequate aid in the air. It was only when the *luftwaffe* came up against the determined and desperate resistance of the British R.A.F. in defending its home territory that the Douhet theory began to break down. Germany soon found that big bomber formations were not mutually self-protective; that they must be covered by fighters in large numbers. And since the range of mixed bomber and fighter fleets is limited to that of the escorting pursuit planes (generally but a fraction of the range of most bombers), it became essential for Germany to secure bases in the north of France and in the Low Countries before she could hope to launch any extensive aerial attack against Great Britain. At that, the work of the British fighter squadrons became so effective by midsummer of 1940 that Germany had to abandon daylight raiding against Great Britain. The heavy damage that was effected in the London area and in the midlands during the latter part of 1940 was done almost entirely at night or in bad weather when the defending fighters had difficulty making contact with the enemy.

The final answer to the question of aeroplane versus battleship remained to be found. Both sides claimed destruction of capital ships at sea and in harbours by aerial bombardment. The early German raids against the Firth of Forth base cost Great Britain some fighting tonnage, and some damage was done to aircraft carriers and to battleships at sea. Late in the year, Great Britain succeeded in rendering a good half of Italy's

surface fleet *hors de combat* with a few squadrons of torpedo planes. Germany consistently and effectively attacked British convoys by bomber squadrons, some of them operating far out at sea. Just how much of Britain's merchant tonnage losses were due to aeroplane attack or to submarine attack is not definitely known. The German high command, however, claimed that since the French armistice in June 1940, the surface navy accounted for some 3,000,000 tons of shipping and the air force about 700,000 tons, or about one out of every four tons by aerial bombing. On the other hand, the aeroplane was proving an effective means of protecting shipping against air attack. At the end of 1940 Air Chief Marshal Sir Frederick Bowhill of the royal air force coastal command reported on the activities of his forces as follows: "More than 2,000 convoys, numbering 40,500 ships, totalling about 200,000,000 tons, were escorted by the coastal command. The value of inbound and outbound cargoes averaged about \$16,000,000 daily. The command flew about 34,000,000 nautical miles during the year."

Protection from the ground against aerial attack has not been as effective as had been hoped. Both sides have been utilizing balloon barrages around cities and industrial areas. These consisted of strings of captive balloons anchored at various heights. Between each pair of balloons cables are stretched from which a network of lighter steel wires or cables is suspended. The cables are difficult to detect by attacking raiders. To strike such a network in full flight is almost always fatal to a fast aeroplane. Some observers claim that more German aircraft have been brought down by the balloon barrage than have been destroyed by anti-aircraft fire. Early in 1940, Great Britain claimed to have over 700 mi. of balloon barrage available. A great deal has been learned and put into practice about anti-aircraft artillery and fire control. The guns themselves have been improved since 1920, so that where the effective vertical range at the close of the war in 1918 was around 12,000 ft., modern anti-aircraft guns are good at 18,000 to 20,000 ft. London and other key cities of Great Britain are surrounded by thousands of anti-aircraft guns and searchlights, but they are not entirely effective as indicated by the almost nightly appearance of German squadrons over British cities.

So far, there seems to be no real protection against massed bombing attack at night or in bad weather from relatively short ranges, once the attackers have left the ground. It seems probable that the only effective way to combat such raids is to attack and destroy enemy aircraft on the ground, or to render untenable the bases from which they must operate. So far, however, Germany has been more successful in this regard than has Great Britain.

Most countries have experimented occasionally with the transport of ground troops by aeroplane, but no country has ever tried

it out on such a scale as did Germany during 1940. Thousands of infantrymen were transported by air into Norway and into the Low Countries. Such transport of troops, however, presupposes the possession of landing fields in territory to be occupied. In order to seize such landing fields to prepare the way for invasion by air, Germany made effective use of a new style of attack and a new type of attacking unit—parachute squadrons.

Although the U.S. army air corps had suggested something of the sort years before, and although Russia had long since done considerable experimenting in that direction, the idea that large bodies of troops could invade enemy territory by parachute seemed too fantastic to warrant serious attention. Most military people believed that parachutists could be shot out of the air like clay pigeons, or disposed of easily once they reached the ground. Such, however, has not proved to be the case. Germany had secretly trained thousands of parachute troops, and many a key airport in Norway, Holland and Belgium got its first notice of invasion when the parachutists began to shower down.

Another idea of the same sort that has been widely discussed but so far not carried into execution, is the use of glider transports for troops. In theory at least, infantrymen may be transported over enemy territory in large glider "trains" towed behind powered aeroplanes. The gliders will then be cut loose from the towing craft and will descend silently over a wide area. They may be landed safely in unprepared fields at strategic points. It has been rumoured that Germany has prepared such transport "glider trains" for the invasion of England, but none actually appeared in 1940.

Another unconventional tactic employed by the *luftwaffe* was the sowing of mines in British coastal waters by aeroplane. By the year's end, British defence units had this technique more or less under control, but during the early months of 1940 a considerable amount of British shipping was destroyed by mines laid at night by German seaplanes.

The experiences of the first year of the war in the air have brought out a number of new ideas with respect to fighting aircraft. In order to provide needed protection for long-range bomber flights, a new type of fighter has emerged. Heretofore the single seater was accepted as the best fighter, a hangover from 1918. As an interceptor for defensive purposes it was in 1940 still considered indispensable, but the twin-engine, multi-place fighter, or "destroyer" as the Germans have termed it, was rapidly proving its superiority. Germany has developed at least two effective machines of this kind, the Messerschmitt 110 and the Focke-Wulf 187, ships that were in 1940 displacing the Me-109s that formed the backbone of the *luftwaffe* fighter squadrons up to the beginning of the battle for Britain. The Me-110 is a monoplane powered with two Daimler-Benz engines of 1,050 h.p. each. It carries a crew of two (a pilot and a gunner-navigator-radio operator). It is armed with two 20-mm. cannon and four 30-calibre machine guns. It is said to have a top speed of about 365 mi. an hour. The FW-187 is of the same general type. It carries the same crew and armament. A great deal of attention has been

TYPICAL GERMAN TACTICS in raiding southeastern England. *Left:* The Germans first dispatch planes over Tunbridge Wells to engage R.A.F. planes there and draw reinforcing planes from Sheerness. *Centre:* The next raid is over Dover. Dover planes as well as more from Sheerness rise to meet the attack. Sheerness, provided the stratagem works, has then been depleted of reserve planes. *Right:* The main attack is then directed at Sheerness, which must be defended by planes from other fields. Sometimes, however, these planes arrive too late for effective action

paid in both machines to providing heated cockpits and oxygen equipment for long-range flights at high altitudes. The manoeuvrability of these machines is reported as good as that of the smaller single seaters, but their effective range and fire power are many times greater. They are, perhaps, the most formidable fighting machines that have yet appeared.

As is generally the case, military design progress follows a zigzag course—one side or the other obtaining a temporary advantage, shortly followed by improvement of design by the other side. Thus the advantage held by the Me-109 in the early stages of the war was neutralized by improvements in Great Britain's Spitfires and Hurricanes. By the close of 1940, the Me-110s and FW-187s showed a slight edge on the British fighters. At the end of the year, however, new British types, said to be superior to the German destroyers were reported to be taking the air. The Boulton Paul Defiant with its two-man crew and four-gun powered turret has made an excellent showing against the improved German types. The latest Spitfire, built around the Rolls-Royce Merlin engine of 1,300 h.p., was said to have a speed of better than 390 mi. an hour and to carry 12 guns, including two 23-mm. cannon and two 50-calibre machine guns. A super-Spitfire, powered with the new Rolls-Royce Griffon engine of 1,600 h.p., was going into production in 1940. Two new Hawker types, improvements on the Hurricane, were known to be near completion. One of them, the Tornado, was said to be powered with a 2,000-h.p. Rolls-Royce Vulture engine (a 24-cylinder X motor based on the Merlin). Another type which was reported, but which was not seen in service in 1940, was the Westland Whirlwind, said to be powered with two Napier engines and to carry a great number of guns.

Germany, too, was known to be developing new and improved fighter types built around engines of high horsepower. Both Daimler-Benz and Junkers were known to have in production engines in the 2,000 h.p. range and they would likely appear in production aircraft in early 1941.

Bombers were also coming in for their share of development. The twin-engine medium type, such as the Heinkel 111, the Dornier Do-215, the Junkers Ju-88, the British Bristol, Blenheim and Beaufort, Handley-Page Hampsons and the American-built Bostons (Douglas DB-7) and Baltimores (Martin 187) were all undergoing steady improvement. Both the British and the Germans were in 1940 working on four-engine bombers of much larger size, machines comparable to the U.S. Boeing four-engine Flying Fortresses, some of which have been sold to Britain. Great Britain needed big bombers in 1940 in order that she might reach industrial centres many hundreds of miles inside German territory and in the north of Italy and to protect her convoys. Germany in 1940 had plenty of bombers of sufficient range to operate against British cities from bases on the mainland of Europe, but her main interest in long-range heavy bombers was for use far out at sea against Britain's merchant convoys. Stories were current of large machines capable of doing patrol duty at sea for as long as 36 hours at a stretch. During the latter months of 1940, Germany used her aircraft as an efficient auxiliary to her undersea fleet in her attempted blockade of Britain.

One of the most important lessons of the first year's active experience in modern air fighting was the realization that fire power and ability to absorb punishment are controlling factors. Where only a few years back two and three machine guns per aeroplane were considered ample, in 1940, six, eight and twelve guns, at least half of them 50-calibre, supplemented by at least one automatic quick-firing cannon, were considered indispensable. Spitfires, for example, carried eight to twelve machine guns, all fixed, all firing forward and all focused on a point ahead of the aeroplane. These guns fired at rates around 600 shots a minute. The chances for survival of an enemy pilot caught at point blank range in such a cone of fire were reasonably slim.

Besides the 30- and 50-calibre standard machine guns, the quick-firing 23-mm. aircraft cannon was rapidly coming into wide use. Such cannon were sometimes mounted in pairs, firing forward, as in the Me-110 and FW-187. They had a far more effective range than had any machine gun. They fired explosive shells that would detonate on contact with aeroplane fabric or on piercing any thin sheet metal. They might cause considerable damage over a wide area of wing or in engine nacelle, or in pilot's cockpit.

The rapid improvement in fire power accelerated tremendously the study of protective armour for all military aircraft. Up to the outbreak of the war, little real attention had been given to protecting the pilot or vital parts of the aircraft with armour plate. Aeroplane designers relied more on manoeuvrability and speed to avoid direct hits than they did on armour to absorb or to deflect missiles without material damage. Besides, armour is a dead loss as far as performance is concerned. The more weight that is put into armour, the less can be put into gasoline and the more the effective range is reduced. There seemed to be nothing that could be done in 1940, however, except to accept the fact that a sufficient amount of armour of some kind must be provided to protect the pilots and crews against anything but point-blank firing with heavy guns. A great deal of study was going into the problem of securing tough, lightweight steels and of disposing of them most effectively around pilot's and gunner's cockpits.

One of the important developments of this sort was in the leak-proof gasoline tank. It would obviously be of great military value if fuel tanks could be surrounded by something which could flow into and block off any kind of hole that might be made in a tank by gunfire. It would also reduce the hazard of fire and explosion from the penetration of fuel tanks by bullets. Much theoretical work and some experimentation had gone on in various countries since the close of the war in 1918, but Germany was the only country that entered the European war with large numbers of its fighter aircraft fitted with protected fuel tanks. The results were so conclusive that presently every country, including the U.S., began extensive research and development on tank protection.

But in spite of the importance of superior performance, the ability to produce aeroplanes in large numbers will eventually determine the course of the European war. It is well known that Germany, at the outbreak of war in 1939, possessed almost twice the number of military machines as did France and Britain combined. Furthermore, her producing plants were probably capable of turning out at least twice as many units a

FORMATION FLYING does not afford complete protection for bombers. The squadrons are still vulnerable in a 40° cone behind the direction of flight. This exposed area must be covered by escort fighters

BOMB SIGHTS designate the correct point of release, taking both speed and altitude into account. Because even a fast bomber may turn tail before it reaches a point directly over the target, anti-aircraft guns must be spaced a considerable distance on all sides of the objective

month as were the combined factories of France and Great Britain. When the productive capacity in the United States became a factor in 1940, it seemed not impossible that within a relatively short time, say within a year and a half, the combined air forces of Great Britain and France would equal that of Germany. But the collapse of France not only made it necessary to subtract the French output from the combined total, but to add part of it to the German production figures. Most of the larger French aeroplane and engine manufacturing plants went into German hands with the surrender of France. British production under normal conditions was increasing steadily and satisfactorily. With the extensive damage done by the night bombings during the fall of 1940, however, it seemed probable that serious reductions had been made in British plant output capacity. This created a demand for accelerated output by U.S. factories. T. P. Wright (in *Aviation* for Jan. 1941) estimated that British aeroplane production, plus one-half the future U.S. aircraft output, would equal the total production of the axis powers by midsummer of 1941. It would be early summer of 1942, however, before the royal air force would be up to the strength of the air arms of the axis.

Although the British conducted extensive and continuous air raids against German industrial centres, it seemed likely that the interruption of aircraft production was far less in Germany than it was in England. German attackers must fly only short distances to get at British factories in the Midlands, whereas British bombers must fly long distances with relatively light bomb loads to reach Oranienberg, Dessau or Turin. The probabilities were that Germany could utilize far more of her installed productive capacity than could England. The major question from the British point of view in 1940 was how soon and how effectively could the United States push deliveries of aircraft and engines.

In the *Book of the Year, 1940* an attempt was made to score the air strength of the major powers on the basis of such fundamental elements as: aircraft on hand, capacity to produce, ability to train pilots and mechanics, and the general morale of the working population. At that time Germany was considered the yardstick against which the air power of other nations must be measured. It would be far more difficult (Jan. 1, 1941) to make a comparison in anything like the same form. For some of the reasons given above, many of the basic elements had been shifted tremendously, and for obvious military reasons it was impossible (Jan. 1, 1941) to get an accurate picture in detail.

There was little doubt, however, but that at year's end Germany still occupied a dominant position in the air. German squadrons raided British cities seemingly at will—witness the bombing of Coventry on Nov. 15, 1940, in the course of which some 500 aircraft were said to have been employed and well over 1,000,000 lb. of bombs dropped. A few weeks later, raids of the same order of magnitude wiped out large areas in the City of London and partially destroyed Bristol and several other seaport towns.

According to a Berlin report dated Jan. 2, 1941, over 2,000 bombing attacks were made on Great Britain by the German *Luftwaffe* since Aug. 8, 1940. It is claimed that over 92,000,000 lb. of high explosive bombs and over 3,500,000 lb. of incendiaries were dropped on British soil during that period. British reports indicated that air-raid casualties for the last six months of 1940 came to about 50,000, of which some 19,500 people were killed. If both sets of figures are accurate, it cost Germany about one ton of bombs for each casualty inflicted, or about two and a half tons for every citizen killed. This is not, however, any true measure of the effectiveness of aerial bombardment under the Douhet theory. The cost to Great Britain in terms of property destroyed, production disrupted and life in general rendered extremely uncomfortable is beyond computation.

The British conducted retaliatory raids of some magnitude, but Germany claimed that it dropped 25 lb. of bombs on Great Britain for every pound the royal air force dropped on Germany.

That some such disparity existed is not impossible. Germany operated

SOME MODERN FIGHTERS are equipped with cannon, firing shells which explode on contact. Such planes can fire from outside the effective range of machine guns in the tail of the bomber

against key British cities at ranges of only 50-100 mi. from bases in France. One bomber might easily make two or three trips nightly against cities in the Midlands. The R.A.F., on the other hand, flew over the North sea and many miles over hostile territory before reaching most German objectives of importance. This not only increased the danger of detection and interception, but seriously reduced the bomb loads that might be carried. It is many times more difficult to deliver a ton of bombs in Berlin than in London. But the R.A.F. was making marked progress against tremendous odds. At the close of 1940, indications were that the British were beginning to reduce the 25-to-1 ratio considerably. Reports indicated that the R.A.F. inflicted damage at Bremen and Hamburg of something near the magnitude of the German raids against Coventry and Bristol. (See also AVIATION, CIVIL; CHEMICAL WARFARE; EUROPEAN WAR; LIGHTNING WAR; MUNITIONS OF WAR; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR.) (S. P. J.)

Air Mail: see POST OFFICE.

Airports and Flying Fields. In the United States, a record-breaking expansion in all flying activities occurred as a result of the European war. Airline traffic expanded at an unprecedented rate and thousands of new pilots were being trained in 1940 under the programs of the army and navy and the civilian pilot training program of the Civil Aeronautics administration. In order to meet the demand created by this expansion for airports in addition to those required for national defence, congress in the fall of 1940 appropriated the sum of \$40,000,000 to be expended for airport construction as a part of a well rounded long range program to meet the nation's airport needs, this construction to be accomplished under the supervision of the Civil Aeronautics administration. While most of the fields which were to be improved and developed under this program were to be used primarily for military aviation in national defence, they will, at some future date, be converted back to civil aviation and aviation as a whole will gain materially from this program.

Federal Airway System of the United States.—The expansion in all flying activities, coupled with the emergency expansion in 1940, emphasized the need for an expanded federal airway system providing adequately lighted airways fully equipped with radio communications and weather reporting facilities throughout the United States and its possessions. To meet these developments, the Civil Aeronautics authority during 1939 and 1940 conducted an expansion program on a scale larger than ever before. This program, which included both new construction and improvements to existing airways, added 3,432 mi. of new airline highways

A FIGHTER attacking a bomber must approach from the rear, draw a bead on his target and unleash a single blast of his guns. Most fighters carry only enough ammunition for a half minute of continuous firing

to the federal airway system. The Civil Aeronautics administration was engaged in 1940 on a new program which, adding another 2,500mi. of airways, will be marked by important expansions in Alaska, the United States islands in the Pacific and the Caribbean area. On July 1, 1940, there was completed a federal airway system embracing 28,745mi. of airways in full operation in the continental United States. Facilities installed on these airways comprised 2,205 beacons of various types, 296 lighted intermediate landing fields, 105 full power radio range and communication stations with broadcast facilities, 136 medium power range and communication stations, 33 low power radio range stations, 42 non-directional radio marker beacons and 45 ultra-high frequency markers, with the addition during 1940 of 3,410mi. of teletype circuits for weather reporting. These circuits, July 1, 1940, totalled 27,068 miles.

Washington National Airport.—Upon completion, in the early part of 1941, the Washington National airport may well serve as a model for all metropolitan terminals of air traffic. While not the largest in the world, its size is sufficient to provide with future developments for all foreseeable airline traffic. The safety and other aeronautical factors in its design are well in excess of the usual requirements. Runway lengths are: N. to S., 6,875ft.; N.W. to S.E., 5,300ft.; N.E. to S.W., 4,820ft.; and E. to W. 4,200ft.

The terminal building lies almost in the centre of the development and is connected by taxiways to the ends of each of the four runways. The building itself runs 540ft. along a curved line and is three stories high exclusive of the control tower from which every part of every runway is visible. The ground floor is almost exclusively working space; the main floor is devoted to the handling of passenger traffic and visitors; the upper floors are for airline and airport officials except for the dining room in the north wing and for the operation of airway and airport traffic control, radio communications and weather bureau. The main dining room extends 120ft. by 40ft. and its east wall is entirely of glass and faces a 20ft. dining terrace overlooking the flying field, the river and the city. The lessees of this space are expending some \$300,000 in decoration and equipment. Parking space will be provided for about 5,000 cars ordinarily, with emergency space for about 3,000 more. There likewise will be bleachers or a grandstand along the edge of the flying field and 10ft. above it running north from the terminal building. These

facilities were determined upon after careful studies of airports, both in the United States and in other countries. It was learned, for instance, that before the war which started in 1939 a large part of the patronage of the Dutch airlines was secured from among the sight-seers who came to Schipol airport at Amsterdam, and that the patronage of the restaurants and observation terraces on the mile-long roof of the hangars at Tempelhof in Berlin paid a large share of the cost of the airport.

With 144 scheduled landings and take-offs every 24 hours, Washington was in 1940 the third busiest airport in the United States. In addition, other airlines filed applications for service into Washington. Hence it is predicted that the new airport will be devoted mainly to airline service. The airport will cost in the neighbourhood of \$12,500,000 when completed. (E. M. E.)

Air Races. In a year when events in the air struck a far more sinister note than in any previous year since 1918, the number of air race events were, by necessity or by governmental order, temporarily cancelled. Chief among these were the 1940 National Air races which, for 19 years, had been a world famous annual event. One explanation for this is the fact that aeroplane production was almost completely occupied in defence activities with few racing planes being made for private use.

However an annual event—the Bernarr Macfadden Trophy race—was won by H. C. Rankin of Wichita, Kan. He won the race at Miami, Fla., flying a new type Beechcraft twin-motored plane. The prize was \$3,000. Rankin averaged 234.097 m.p.h. over the 1,080-mi. course from St. Louis, Mo. He made the nonstop flight in 4hr. 37min. 40sec.

Another air race of significance was the Firestone Trophy race, the feature event of 1940 for aerial flivvers. Jack Snodgrass captured this race, flying the 15-mi. course at an average speed of 105.255 m.p.h.

One event with international flavour was the Colonel Batista Cup race for aerobatics at Camp Columbia airfield. This was won by Capt. Alexander Papana.

Among the few air events for women fliers was the Culver Trophy races in California. This was won by Edna Kidd of New Orleans, who finished just in front of the famed Laura Ingalls of Burbank, Calif. (T. J. D.)

Air Raid Precautions: see ELECTRIC LIGHTING: *Lighting Applications*; LONDON.

A.L.A.: see AMERICAN LIBRARY ASSOCIATION.

Alabama, one of the "deep south" states of the United States, admitted to the union 1819; area, 52,250 sq.mi.; population (U.S. census, 1940) 2,832,961. Capital, Montgomery, 78,084. Cities with larger population are Birmingham, 267,583 and Mobile, 78,720. Of the state's population in 1940 855,941 were urban, or 30.2%. There were in 1930 1,700,775 whites; 944,834 Negroes; 2,630,370 native-born; 15,878 foreign-born.

History.—In the presidential election of 1940 the voting was as follows: Roosevelt (Dem.) 250,723; Willkie (Rep.) 42,184; Babson (Prohibitionist) 700; Browder (Communist) 509; Thomas (Socialist) 100. Chief officers of the state elected for service beginning Jan. 16, 1939 were: governor, Frank M. Dixon; lieutenant governor, A. A. Carmichael; state auditor, Howell Turner; secretary of state, John Brandon; state treasurer, C. E. McCall; attorney general, T. S. Lawson; superintendent of education, A. H. Collins; commissioner of agriculture and industries, J. H. Paterson.

Education.—A well defined system of elementary and high schools and colleges for both races is maintained. Elementary education is free between the ages of 6 and 21, and compul-

sory between the ages of 8 and 16. State appropriations in 1940 amounted to \$14,770,041. Total revenues from all sources were approximately \$28,280,000. Illiteracy among whites between 10 and 20 years is 1.9%, Negroes 2.6%. There are seven state-supported institutions of higher education for whites and three for Negroes. Several colleges are maintained by the Methodists, Baptists and Catholics.

Charities and Correction.—The state supports many philanthropic and penal institutions: institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; and a reformatory school for Negro boys; a child welfare department; juvenile courts; a model state prison and a penitentiary system in which the state provides employment for its convicts.

Banking and Finance.—In 1940 there were 66 national banks with a capital stock surplus and undivided profits of \$50,462,000, deposits of \$233,731,000 and total assets of \$268,659,000; 151 state banks with a capital stock surplus and undivided profits of \$22,224,499, deposits of \$96,320,940 and total assets of \$111,644,594. Revenue sources include a property tax, income tax, sales tax, privilege taxes and levies on gasoline, tobacco, beer and liquor. Receipts for the fiscal year ending Sept. 30, 1938, were \$55,987,312; disbursements, \$57,239,498; state debt, \$68,100,000.

Agriculture, Manufactures, Mineral Production.—Alabama ranked second among the cotton-planting states in 1860. Many crops are produced in large quantities, but cotton is still the most important one. The state had an estimated output of 790,000 bales in 1940, compared with an annual average for the ten years (1930-39) of 1,200,000 bales. In 1935 there were 273,455 farms covering 19,660,828 ac. with lands and buildings valued at \$368,219,654.

In 1929 there were 2,848 establishments hiring 132,200 workers and producing goods valued at \$560,378,132. In 1940 there were about 1,800 establishments, but industrial pay rolls were much larger than in 1929; there were about 20,000 more employees and output in the major fields reached new high levels. A \$15,000,000 aluminium plant was established at Sheffield and a large shipbuilding plant at Mobile. A great expansion of the steel industry was under way. The two great basic industries are cotton textiles and iron and steel. Other important industries are lumber, blast-furnace products, cast-iron pipes and fittings, cotton-seed oil and meal, coke-oven products, cement and electric power. The manufacture of electricity is one of the state's most important industries. The capacity of the generating plants of the Alabama Power company is about 900,000 h.p. and the TVA plants in the state are capable of producing slightly more. There are about 6,000 mi. of rural electric lines. The mineral output of the state was valued at \$53,518,993 in 1937 with coal and iron ore leading.

(A. B. Mo.)

Alaska. Alaska, in its greatest extent, is included between the meridians of 130° W. longitude and 173° E. longitude and between the parallels of 51° and 72° N. latitude. It is bounded on the north by the Arctic ocean; on the west by the Arctic ocean, Bering strait and Bering sea; on the south and southwest by the Gulf of Alaska and the Pacific ocean; and on the east by the Yukon territory and British Columbia. The eastern boundary, from the Arctic ocean to the neighbourhood of Mount St. Elias, is the 141st meridian; thence southeastward to Portland canal it is irregular and cannot be described in general terms, except that it runs approximately parallel to the irregular shore line and about 30 mi. therefrom.

Alaska is in approximately the same latitude as the Scandinavian

peninsula; Point Barrow, its northernmost point, is in about the same latitude as North cape; Dixon entrance, which marks its southern boundary, is nearly on the same parallel as Copenhagen; Juneau is in the latitude of Oslo and Leningrad; and Sitka is in the latitude of Edinburgh.

The longitude of the western terminal of the Aleutian islands is almost identical with that of the New Hebrides islands and is the same as that of New Zealand; and Cape Prince of Wales, the most westerly point of the mainland, is nearly as far west as the Samoan islands. Thus a person travelling from New York to Attu island, the westernmost of the Aleutian chain, on reaching San Francisco will have accomplished less than half the journey from east to west.

The area of Alaska is about 586,400 sq.mi., one-fifth that of the United States. In 1940 the population was 72,524. A map of Alaska superimposed on a map of the United States of the same scale, demonstrates that the distance from the easternmost to the westernmost point in Alaska is equal to the distance from the Atlantic to the Pacific in the latitude of Los Angeles, and that its northernmost and southernmost points are as far apart as the Mexican and the Canadian boundaries of the United States.

History.—The most important occurrences in Alaska during 1940 relate to the inclusion of Alaska in the system of national defence. Until 1940, the only military forces in the vast territory were two companies of infantry stationed at Chilkoot barracks, near Haines—a survival of the days when thousands of prospectors sought the Klondike gold-fields. The year 1940, however, marked the establishment of an air training base, Ladd field at Fairbanks; a great air base near Anchorage, Elmendorf field; navy air stations at Sitka, Kodiak and Dutch Harbor. Construction on all of these was in process at the close of 1940. Work, also, on additional fields for military, as well as commercial purposes, was begun at Annette island near Ketchikan, the southern port of entry to Alaska, and at Yakutat. Likewise, 1940 marked the first organization of the Alaska national guard, four companies of which were authorized in July, and formally inducted into service in September and October by Governor Gruening.

Another significant event was the linking of Alaska by regular commercial air service with the United States. In June, Pan American airways inaugurated a bi-weekly clipper service from Seattle to Ketchikan and Juneau, from which point scheduled air service to Fairbanks and Nome had already been established.

Industries.—Alaska's chief products are fish, metals and fur. In 1940, fish and fish products shipped from the territory were valued at \$40,104,493. Of this amount \$34,441,082 represents the value of canned salmon alone, which is the principal industry of the territory. The total value of mine products shipped to the United States in 1940 was \$25,296,000, of which the gold shipments amounted to \$23,279,000. Furs valued at \$1,892,968, not including the fur seals, were shipped from Alaska during the calendar year 1939, a decrease of \$44,402 from the previous year.

(E. GRU.)

Albania. A kingdom in the western part of the Balkan peninsula. Its area is 10,800 sq.mi., its population was estimated at a little more than 1,000,000. Formerly a part of the Ottoman empire, the mountainous land inhabited by semifeudal tribes, of which the majority are Mohammedans, with a large Christian minority, was constituted in 1913 as an independent country. On April 7, 1939, Italian forces suddenly invaded Albania, King Zog was forced to flee and the country received on June 4 a new constitution, according to which it became a nominally independent kingdom under the crown of Italy. King Victor Emmanuel III, emperor of Ethiopia, became king of Albania and the principles of fascist life and morale were introduced officially

as the foundation of Albanian civilization. The fears aroused in neighbouring Greece and Yugoslavia as the result of this occupation were eased by repeated official Italian assurances that there was no intention of attacking other Balkan nations.

The year 1940 in Albania was taken up with the construction of strategically important roads to the Greek and Yugoslav frontiers, with the fortification of the country and with the storing of large military supplies. In Aug. 1940, the fascist press in Albania and in Italy began a violent campaign against Greece, accusing the latter of oppressing the Albanian minority in the Greek Epirus and claiming the need to protect and liberate these Albanians. In pursuance of this policy, Italy on Oct. 28 suddenly presented an ultimatum to Greece and three hours later started to invade the country from Albania. Against all Italian expectations, the heroic Greek resistance forced the fascist armies not only to withdraw entirely from Greece, but the Greeks were even able to carry the war into Albania. At the end of November they occupied the most important fascist military bases there, Körtcha (Koritza) in the north, the third largest town in Albania, situated in a well cultivated and prosperous area and Argyrokastro in the south, the fifth largest town. From there the Greeks pressed forward toward the sea, conquered Porto Edda, named after Mussolini's oldest daughter and pushed toward the great port of Valona and toward Elbasan in the centre of the country. The British royal air force repeatedly bombarded Valona and the other large Albanian port, Durazzo. It was reported that many Albanians rose against Italian domination and supported the Greek advance. On Dec. 19, the Greek commander, General Alexander Papagos, issued a decree which restored the Albanian law, as existing before the Italian occupation of Albania, in all the territories of Albania occupied by the Greek army. Henceforth only Albanian law was to be applied in Albanian courts except in cases where it might obstruct the Greek forces of occupation. (See also EUROPEAN WAR; GREECE; ITALY.) (H. Ko.)

Alberta. The most westerly of the prairie provinces of Canada, Alberta was created a province by act of the dominion parliament, Sept. 1, 1905. The area of the province is 255,285 sq.mi.; the population by the census of 1936 was 772,782 (486,335 rural and 286,447 urban) and was estimated as 789,000 by the Dominion Bureau of Statistics in 1939.

History.—William Aberhart, the premier, was elected to office Sept. 3, 1935 as head of the Social Credit government. All attempts to put the Social Credit plan into operation since that time have failed, despite the efforts of the government to set up provincial banking systems and to have the dominion government underwrite the net public debt of approximately \$128,000,000.

Alberta first defaulted on a bond issue in April 1937, and successive defaults of the next three years totalled approximately \$14,000,000. A bond issue of \$750,000 bearing 4½% interest matured April 15, 1940 but was retained in the sinking fund, where it had remained since its issue April 15, 1935. In November, the treasury announced it would pay holders of debentures which matured June 1, 1937 interest at the rate of 2½% annually for six months ending Dec. 1, 1940.

Premier Aberhart, who had announced in 1939, that he would appeal to the electorate the following year, dissolved the legislature Feb. 16, 1940. At this time the Social Credit party held 47 of the 57 legislative seats. In the election of March 21, 35 Social Credit and 22 Independent members were returned—a net loss of 12 seats for Aberhart's party. Almost the sole issue of the campaign was the monetary policy of the government. The Independents had appealed to the electorate to disclaim the financial policies of Aberhart and restore the province's credit. Aberhart asked the voters for another term in office so that he might con-

tinue his efforts to establish Social Credit.

Much attention was devoted during 1940 to the Rowell-Sirois report which recommended centralizing the fiscal and social administrations of all provinces in Ottawa. Premier Aberhart was opposed to this plan (as were the premiers of British Columbia and Ontario) on the ground that it would represent excessive interference by the dominion government in provincial affairs. A conference of the provincial premiers with Prime Minister Mackenzie King at Ottawa in Jan. 1941 came to naught.

Agriculture.—Alberta's principal crop is wheat. Other important grain crops are oats, barley, rye and flax. Statistics of output were difficult to obtain in 1940 because of the war. The aggregate farm capital, including land, buildings, implements and livestock, was estimated in 1938 at \$676,614,000. The production of wheat in 1939 was approximately 150,000,000 bu.; oats 82,000,000 bu.; barley 27,000,000 bu.; rye 2,400,000 bu.; flaxseed 340,000 bushels.

Minerals and Fishing.—Petroleum has become an important industry in Alberta, with approximately 100 producing wells in Turner valley. In 1938 a royal commission was established to investigate the whole industry and explore the advisability of governmental control of wholesale and retail distribution. The output in 1939 was curtailed by the Petroleum and Natural Gas Conservation board which established quotas for the various producers.

Fisheries accounted for an income of \$492,943 in 1938.

Alcoholic Liquor: see BREWING AND BEER; LIQUORS, ALCOHOLIC; WINES.

Alfalfa. Production of alfalfa hay in the United States in 1940 was placed at 30,578,000 tons, Dec. 1 estimates by the department of agriculture. This is about 11% more than the 1939 crop of 26,888,000 tons and 22% above the ten-year (1929-38) average of 24,597,000 tons. Alfalfa seed production in 1940 was 1,453,000bu.; in 1939 it was 1,488,200. (See HAY.)

U.S. Production of Alfalfa by States, 1940 and 1939

Alimentary System, Disorders of. Disorders of the Oesophagus.—

On the basis of experiments on the cadaver with oesophageal varices, Juzbašić proposed a new method of intervention which

includes three main steps; namely, interruption of all venous afferent tracts traversing the small omentum, interruption of similar tracts from the region of the spleen and performance of a modification of the Talma operation to facilitate the discharge from the portal vein into the vena cava. The less formidable procedure of injecting a sclerosing solution into the veins was also recommended by Moersch.

The Stomach and Duodenum.—A profusion of investigations pertaining to all physiologic phases of the alimentary tract concerned the response of the digestive organs to various drugs, many of which are currently employed. Horstmann's observations on the comparative effect of insulin and histamine on gastric secretion are confirmative of observations made by others that histamine is not the ideal secretory stimulus and that it may be uncertain in its effects.

Bloomfield, Chen and French, in a study of basal gastric secretion, showed that basal acidity in cases of duodenal ulcer often exceeds the highest control levels, the measurement thereby having definite diagnostic value. This supports Hurst's conception of a hypersthenic gastric diathesis. Values for basal acidity in cases of gastric ulcer were found to be similar to the controls. This fact suggests that gastric ulcer and duodenal ulcer are fundamentally different disorders.

The majority of investigations confirm the injurious effect of tobacco on the stomach. Westphal and Weselmann determined the extent of nicotine injury on the gastric mucous membrane on the basis of gastric cell count, gastroscopy and roentgenoscopy in the human subject and substantiated their findings by animal experimentation. Persons with a labile vegetative nervous system should particularly be warned against the hazards of excessive smoking. These authors expressed the opinion that nicotine is a directly contributing aetiological factor in peptic ulcer.

Vitamin deficiency states and their effect on gastrointestinal form and function and the nutritional shortcomings of patients requiring operation are of increasing interest to the physician and surgeon alike. Weir, Butt and Snell called attention to vitamin K deficiency and hypoprothrombinaemia in conditions other than those due to hepatic disease or jaundiced states. These are gastrointestinal disorders, the general nature of which suggests that there is deficient absorption of vitamin K from the intestinal tract. They include sprue, regional ileitis, intestinal obstruction, gastrocolic fistula, pyloric obstruction and ulcerative colitis. Cheney reported the presence of such deficiency in a case of cholecystic disease without clinical jaundice or hepatitis.

The Biliary Tract and Pancreas.—Observations on the comparative value of roentgenography and duodenal drainage in the diagnosis of biliary calculus were made by Levyn and Meyers. In 45.5% of 33 cases of calculus, surgically verified, positive evidence was afforded by the roentgenologic examination, whereas duodenal drainage gave evidence of the presence of calculi in 85%. Duodenal drainage, however, erroneously indicated the presence of calculi six times in 21 cases in which calculi were not present, whereas the roentgenologic examination did not reveal shadows of calculi in a single instance.

Weyeneth and Wassmer expressed the opinion that acute pancreatic necrosis is a manifestation of autodigestion initiated by the activation of trypsin and manifested by necrosis and haemorrhage, while the lipase subsequently produces fat necrosis. The frequency of this pancreatic disorder in the presence of biliary lithiasis indicated the important role of bile in the development of pancreatitis. Treatment employed with success in five cases was as follows: strict abstinence from food and liquids, restriction of chlorides for 48 hours to diminish pancreatic oedema, daily phlebotomy of 1 to 2 litres of 10% solution of dextrose and from 15 to 30 units of insulin, large doses of atropine to diminish pan-

creatic secretion, enemas to relieve distention, application of an ice bag to the epigastrium and administration of morphine. After four to six days fruit juices and carbohydrates are permitted. Later the biliary tract is examined and in the presence of pathologic changes operation is feasible to prevent recurrences.

The Intestine.—Absorption of various materials from the small intestine in health and disease was in 1940 the subject of much research, the results having a practical bearing on various therapeutic problems. Metabolism and absorption of iron from the gastrointestinal tract were studied intensively by Moore and his collaborators. Serum iron has been demonstrated to be transport iron. When ingested iron reaches the stomach it is subjected to the influence of the prevailing acidity, the free gastric hydrochloric acid apparently having the twofold function of ionizing and dissolving iron not already present in solution or not in an ionized state and of delaying the formation of insoluble and dissociated compounds. Iron is absorbed from the intestinal tract largely, if not entirely, as ferrous iron. Arrowsmith and Minnich have found that iron absorption occurs largely in the duodenum and upper part of the jejunum. (See also VITAMINS.)

All-American Canal: see AQUEDUCTS; IRRIGATION.

Allergy. During 1940 several measures which had been prematurely recommended for various allergic conditions, were proven ineffective. The value of histaminase for relief of various allergic symptoms was disproved by numerous workers (Miller and Piness, Laymon and Cumming and others). Potassium salts for hay fever and asthma were also found valueless (Rubin *et al.*, Spain *et al.*). The attempts at relief of hay fever by the oral administration of pollen were likewise found ineffective (Feinberg *et al.*). Previously accepted measures for the relief of intractable asthma were improved upon. Barach and Cromwell emphasized the importance of helium and oxygen inhalation with the simultaneous intravenous injection of concentrated glucose solution as well as of potassium iodide. For these difficult cases Richards and co-workers described additionally the value of continuous inhalation of epinephrin solution during the attack.

House dust, one of the most common causes of asthma still arouses interest of many workers. While Hampton and Stull proved in animal experiments that it contains a specific antigen differing from that found in common environmental substances (feathers, danders, etc.), the work of Coulson and Stevens indicated that house dust is probably composed of a mixture of many materials in varied proportions, including dried egg white. It may also contain a specific antigen in addition to these mixtures.

Respiratory allergy due to insect emanations is in some localities no longer a clinical oddity. Figley found the May fly is

a cause of symptoms in 7% of 1,284 seasonal hay fever cases in regions about inland bodies of water. Particles of the dried pellicle of the fly cause the symptoms. The importance of other common insects in allergy was further emphasized by Benson, who described severe symptoms following bee stings and mosquito bites and by Wittich who described asthma due to emanations from the Mexican bean weevil.

A possible explanation of the mechanism of sensitization was offered in the interesting observations of Lippard. Confirming the work of previous authors, he demonstrated that normal as well as allergic infants absorb undigested egg white from their highly permeable intestinal tract. The passage of such foreign protein into the blood stream results in the appearance of precipitins in the blood, a transitory phenomenon in both the normal and the allergic infant. The normal infant recovers with no evidence of symptoms. The child with an allergic predisposition (influence of heredity) fails to progress from sensitivity to immunity, and allergic symptoms develop. Similarly significant is the mode in which the skin becomes sensitive (eczema) as shown by the work of Landsteiner and Chase. They demonstrated in the guinea pig's skin that the spread of sensitivity is by way of the lymphatics. If a local skin area is sensitized with poison ivy after incising deeply enough around it to cut off all its lymphatics, the sensitivity remains localized to this skin area. If, however, the lymphatic circulation is not disturbed, such local sensitization becomes general. (See also DENTISTRY.)

Alsberg, Carl Lucas (1877-1940), U.S. biochemist, was born in New York city, April 2. At the time of his death in Berkeley, Calif., Oct. 31, he was director of the Giannini Foundation of Agricultural Economics at the University of California. See *Encyclopædia Britannica*.

Alschuler, Alfred S. (1876-1940), U.S. architect, was born in Chicago, Nov. 2. He was educated at the Armour Institute of Technology and began to practise his profession in 1899. He designed many of the notable buildings in Chicago and was the first to use reinforced concrete construction in the city. He died in Chicago, Nov. 6.

"Altmark": see EUROPEAN WAR; GREAT BRITAIN; INTERNATIONAL LAW; NEUTRALITY.

Aluminium or Aluminum. World production of aluminium in 1939 was estimated at about 675,000 metric tons, distributed as follows: Germany, 200,000; United States, 148,400; Canada, 75,000; U.S.S.R., 60,000; France, 50,000; Norway, 31,000; Italy, 30,000; Switzerland, 28,000; Great Britain, 25,000; Japan, 23,000; and small amounts, 1,000-2,000 tons each, from Hungary, Spain, Sweden and Yugoslavia. No data whatever were available on production outside the United States in 1940, but it seems safe to assume that Germany remained well in the lead, in addition to which she also had in 1940 military control over the Norwegian output and probably had access to some Russian metal if it was required. The French output was outside the occupied area, but if the metal were needed in Germany pressure would doubtless be put on the Vichy government to secure it. Japan was making strenuous efforts to increase her output, which was only about 50% of consumption in 1939, although such data as were known by Jan. 1, 1941 on plant capacity would indicate that this was about 75% of consumption, with six reduction plants in operation; since 1939 six new reduction plants and five plants for the purification of bauxite were licensed, but nothing was known as to their capacity or progress on their construction.

No official report appeared on the aluminium output of the

ALUMINIUM PRODUCTION OF THE WORLD and the chief producing countries, as compiled by *The Mineral Industry*

United States in 1940, but bauxite production increased by 17% over 1939, to 438,000 long tons; imports of bauxite also increased by about 10%, but exports increased by almost the same tonnage, leaving net imports about 5% above the 433,000 long tons of 1939. Estimating on the basis of metal production from the available bauxite supply in past years, the 1940 output of aluminium might be expected to be of the order of 170,000 metric tons, an increase of 15% over 1939, but unofficial estimates for the year claim increases as high as 40%. Imports of crude and semi-finished metal during the first 11 months of 1940 were 14,872 metric tons, an increase of 28% over 1939, while exports dropped 9% to 27,724 tons. (See also CRYOLITE.) (G. A. Ro.)

Ambassadors and Envoys. The following is a list of ambassadors and envoys to and from the United States and to and from Great Britain Jan. 1, 1941.

To and From the United States

¹British representative. ²Minister and consul-general.

American Academy of Arts and Letters

was organized in 1904 by the National Institute of Arts and Letters, a body organized in 1898 by the American Social Science association. Beginning with Nov. 14, 1940 a joint exhibition of the works of Childe Hassam, a member of the academy who died in 1935, and of Edwin Austin Abbey, a member who died in 1911, was shown in the art gallery and will continue indefinitely. The Abbey paintings were lent by Yale university. This gallery and the permanent museum were open and free to the public from 10 A.M. to 5 P.M. weekdays and from 2 to 5 P.M. Sundays and holidays. There were four vacancies in the academy caused by the death of Edwin Markham, Robert Grant, Frederick J. E. Woodbridge and Frederick F. S. Converse. The directors elected in 1940 were: Nicholas Murray Butler, president; Wilbur L. Cross, chancellor and treasurer; William Lyon Phelps, secretary. The other six directors elected were Stephen Vincent Benét, Van Wyck Brooks, Walter Damrosch, William Adams Delano, Charles Dana Gibson and Archer Milton Huntington.

(G. D. V.)

American Academy of Arts and Sciences.

The academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: mathematical and physical sciences, natural and physical sciences, the social arts, the humanities. The officers for the year 1940-41 are: president, Harlow Shapley; corresponding secretary, Abbott P. Usher; recording secretary, Hudson Hoagland; treasurer, Horace S. Ford. The following papers were presented at regular monthly meetings: George R. Harrison, "New Methods in Spectroscopy"; George H. Edgell, "Selected Masterpieces in the Museum of Fine Arts"; Reginald H. Daly, "New Light on the Earth's Interior"; Clarence H. Haring, "Liberty and Despotism in South America"; Jeremiah D. M. Ford, "Hispano-American Culture"; Gregory Pincus, "Artificial Parthenogenesis and Sexual Reproduction in Animals"; A. E. Staley, "World Economy in Transition"; Hu Shih, "Some Philosophical Rebels of Seventeenth Century China"; C. C. Little, "Cancer Research and the National Health Problem." Two afternoon symposia were held:

On Dec. 13, 1939, the general topic "The Structure of the Earth" was discussed by Lyman Spitzer, F. G. Watson, R. D. Evans, L. B. Slichter, P. W. Bridgman and Francis Birch. On March 13, 1940, "Current Economic Problems" were discussed by A. H. Hansen, H. B. Killough, J. D. Black and A. F. Lucas.

The following papers were read by title, and will appear presently in the *Proceedings*: "The Measurement of Hydrostatic Pressure to 30,000 kg./cm.," P. W. Bridgman; "Neurohumors as Chromatophore Activators," G. H. Parker; "A Revision of the Nearctic Hemerobiidae, Sisyridae, Berothidae, Polystoechotidae, and Dilaridae," F. M. Carpenter; "Fossil Parasitic Hymenoptera of the Family Scelioidea from Baltic Amber," C. T. Brues. Grants in aid of research were made from the Rumford fund, the C. M. Warren fund and from the Permanent Science fund; 35 awards amounting to \$10,250. (A. P. U.)

American Academy of Political and Social Science

continued to expand its activities during the year 1940 along the same general lines that it has followed through its 50 years of life. It provided a public forum for the discussion of questions of national and world importance, utilizing both publications and meetings for the purpose. On April 12 and 13 there was held the Forty-fourth Annual meeting, with the general subject, "The United States and a Durable Peace," the proceedings being published later under the title, *When War Ends*.

On Oct. 5 a meeting was held on "America's Food and Europe's Need," addressed by Professor John G. Black of Harvard university, Sir Willmott Lewis, Washington correspondent of the *Times* (London), and Clarence E. Pickett, executive secretary of the American Friends Service committee.

Each issue of *The Annals*, the bi-monthly journal of the academy, is a symposium on some chosen subject, and the six regular issues were published during 1940 with titles as follows: *Intergovernmental Relations in the United States* (Jan.); *Mexico Today* (March); *Marketing in Our American Economy* (May); *When War Ends* (July); *Our Foreign Commerce in Peace and War* (Sept.); *Children in a Depression Decade* (Nov.). Also there were published two pamphlets, entitled respectively *European Plans for World Order* and *The Roots of Totalitarianism*.

The most important innovation in the activities of the academy during 1940 was the establishment of a student membership, which confers all the privileges of the regular membership but at a cost to students of only \$3 per year instead of the usual \$5.

(E. M. P.)

American Association for the Advancement of Science.

The officers of the American Association for the Advancement of Science for 1940 were Albert Francis Blakeslee, director of the Carnegie Institution for Experimental Evolution, president; Forest Ray Moulton, permanent secretary; Otis W. Caldwell, general secretary; John L. Wirt, treasurer; and Sam Woodley, assistant secretary. The retiring president, Dr. Wesley C. Mitchell, delivered an address on "The Public Relations of Science."

In 1940 the membership of the association passed 21,000. Its affiliated and associated societies, 174 in number, had a combined membership, including duplications, of nearly 1,000,000. The association held two meetings in 1940, its annual meeting in Columbus, Ohio, which closed on Jan. 2, and a joint meeting with its Pacific division, June 17-22. The attendance at the annual meeting was about 6,000, including representatives from every one of the 48 states, three dependencies and ten foreign countries. At this meeting a total of 2,154 addresses and papers were delivered or read. The annual association \$1,000 prize was awarded to Dr. I. I. Rabi for his investigations of radio frequency radiations of molecules and atoms. Ten grants in aid of research were given. One of the features of the meeting was a symposium on "Blood, Heart and Circulation," organized by the section on medical sciences and participated in by 39 specialists in the field. This symposium was published by the association, the 10th symposium published in three years. Other symposia published during 1940 were "The Genetics of Pathogenic Organisms" and "The Cell and Protoplasm." In October the first of the non-technical Association Science Series was published, a book on *Multiple Human Births* by Dr. H. H. Newman.

At the summer joint meeting with the Pacific division, held in Seattle, Wash., there was an attendance of about 1,100 different persons and there were 644 addresses and papers on the programs. At this meeting the president of the Pacific division, Dr. Lewis M. Terman, delivered his retiring address on "Psychological Approaches to the Biography of Genius." (F. R. Mo.)

American Association of University Professors: see ACADEMIC FREEDOM.

American Bankers Association.

Membership in the American Bankers association in 1939-40 under the administration of Robert M. Hanes, president of the Wachovia Bank and Trust company, Winston-Salem, N.C., reached the greatest percentage since the organization was founded, with approximately 83%, or 14,333 of the banks in the United States belonging.

The association's activities and services to its membership were expanded during the year with the creation of four new departments for research in the banking field. These new divisions consist of a consumer credit department, a department of research in real estate and mortgage loans, a department of customer relations, and a department of economics.

Officers elected at the annual convention of the association in Atlantic City, N.J., Sept. 22-26, 1940, for the ensuing year were: president, P. D. Houston, Nashville, Tenn.; first vice-president, Henry W. Koeneke, Ponca City, Okla.; second vice-president, W. Linn Hemingway, St. Louis, Mo.; treasurer, B. Murray Peyton, Duluth, Minn.; executive manager, Dr. Harold Stonier, New York, N.Y.; senior deputy manager, Frank W. Simmonds, New York, N.Y.; secretary, Richard W. Hill, New York, N.Y.; national bank division, president, Andrew Price, Seattle, Wash.; vice-president, C. W. Bowman, Montgomery, Ala.; trust division, president, Carl W. Fenninger, Philadelphia,

38 AMERICAN BAR ASSOCIATION—AMERICAN CITIZENS ABROAD

Pa.; vice-president, Richard G. Stockton, Winston-Salem, N.C.; state bank division, president, Harry A. Bryant, Parsons, Kan.; vice-president, A. L. M. Wiggins, Hartsville, S.C.; savings division, president, Roy R. Marquardt, Chicago, Ill.; vice-president, Stuart C. Frazier, Seattle, Wash.; state secretaries section, president, Armitt H. Coate, Moorestown, N.J.; first vice-president, William Duncan, Jr., Minneapolis, Minn.; second vice-president, Fred M. Bowman, Topeka, Kan.

(L. GN.)

American Bar Association. A committee on national defence was set up in September with headquarters in Washington, D.C., to make the skill and resources of the legal profession fully effective for national defence.

Under the chairmanship of Edmund Ruffin Beckwith of New York city, this committee helped organize the bar to co-operate in the administration of the Selective Service act by serving on advisory boards, boards of appeal and as appeal agents, and by giving legal aid to men called into service and their families. The committee prepared and distributed a manual for the use of advisory boards. Various committees recommended technical improvements in substantive and procedural law. Awards: annual medal of the association to Roscoe Pound, former dean of Harvard law school, for conspicuous service in the cause of American jurisprudence; Ross prize of \$3,000 to Professor Thomas Fitzgerald Green of the University of Georgia law school for an essay on the subject "To What Extent May Courts Under Rule-Making Power Prescribe Rules of Evidence"; awards of merit to State bar of Texas and Cleveland Bar association.

Elected at the 1940 meeting were: Jacob M. Lashly, president; Thomas B. Gay, chairman of the house of delegates; Harry S. Knight, secretary; John H. Voorhees, treasurer; Joseph D. Stecher, assistant secretary.

(M. DN.)

American Bible Society. The 124th annual meeting of the American Bible society was held in May 1940. John T. Manson is president. Gilbert Darlington is treasurer. General secretaries are Rev. Dr. Eric M. North, in charge of translation and foreign activities, and Rev. Dr. Frederick W. Cropp, in charge of activities in the United States. Rev. Dr. Francis C. Stifler is editorial and recording secretary.

The society distributes about 3,700,000 volumes of Scripture annually in the United States. In co-operation with the British and Foreign Bible society, the Scottish Bible society and other missionary organizations, the Scriptures were translated into 1,039 languages up to the end of 1939, and about 26,000,000 volumes of Scripture were distributed in 1939 throughout the world. The society's principal office is at Park avenue and 57th street, New York city, with branch offices in 11 cities in the United States and agencies, depositories and publishing offices in many other countries, in co-operation with the British and the Scottish Bible societies. The American Bible society elects a vice-president from each of the 48 states and among those so chosen have been Chief Justice Hughes, John R. Mott, William Lyon Phelps, J. L. Kraft and General Evangeline Booth.

(F. C. Sr.)

American Chemical Society. The society operates under a national charter from the 75th congress. In 1940, the presidency passed from Dr. C. A. Kraus of Brown university to Dr. S. C. Lind of the University of Minnesota, with Dr. William Lloyd Evans of Ohio State university as president-elect. He became president Jan. 1, 1941. National meetings in Cincinnati and Detroit showed attendances of 3,514 and 4,206 with 433 and 496 scientific papers, respectively. The 92 local sections were more active than ever.

The awards of the society: to Eric G. Ball, the Eli Lilly and company award in biological chemistry; to Edward R. Weidlein, the Pittsburgh award; to R. E. Gibson, the Hillebrand award; to J. M. Nelson, the Nichols medal; to William Henry Bradshaw, the Schoellkopf medal; to Vladimir N. Ipatieff, the Willard Gibbs medal. Membership passed 25,000.

(C. L. Ps.)

American Citizens Abroad. The following is an estimate of the number of American citizens living abroad, as of Jan. 1, 1940, compiled from reports received from U.S. consulates in all parts of the world. This estimate includes only those whose residence abroad has a permanent or semipermanent character and therefore excludes tourists and all others whose sojourn abroad was considered to be only transitory. Attention is called to the fact that in spite of the care exercised by consuls in preparing their reports, it was impossible in many cases for them to obtain exact figures as to the number of Americans residing in their respective districts. Nevertheless, this estimate, based on all available sources of information, may be regarded as a fairly accurate world census of Americans living abroad.

AMERICAN AND BRITISH women and children hastily evacuated Hongkong as Japanese threats to the colony multiplied in 1940

The following summary report covering persons procuring passports and renewals during the calendar year which ended Dec. 31, 1939, is based upon actual count compiled from individual passport and renewal applications filed during that year and not computed as heretofore from a cross-sectional study. This 1939 summary report is therefore not comparable with reports for years previous to 1938.

The United States maintains the following diplomatic and consular offices abroad: 20 embassies (10 perform diplomatic as well as consular duties); 33 legations (20 perform diplomatic as well as consular duties); 50 consulates general; 177 consulates; 3 vice-consulates.

(R. B. S.)

American College of Surgeons. The college was founded in 1913 by 500 surgeons of the United States and Canada, under the leadership of the late Dr. Franklin H. Martin, to ensure a standard of professional, ethical and moral requirements for every graduate in medicine who practises general surgery or any of its specialties. Fellowship, 1941: 13,111. Chairman, board of regents, Dr. Irvin Abell, Louisville, Ky.; president, 1940-41, Dr. Evarts A. Graham, St. Louis, Mo.; president-elect, Dr. W. Edward Gallie, Toronto; treasurer, Dr. Dallas B. Phemister, Chicago, Ill.; secretary, Dr. Frederic A. Besley, Waukegan, Ill.; associate director and chairman, administrative board, Dr. Malcolm T. MacEachern, Chicago,

* While a great many applicants inserted "All countries" in the space provided in applications for destination, it is the opinion of the department of state that practically all who gave "All countries" as their destination contemplated visiting western Europe.

Ill.; associate director, Dr. Bowman C. Crowell, Chicago, Ill.; assistant directors, Dr. E. W. Williamson and Dr. Harold Earnheart, Chicago, Ill. The organization originated the hospital standardization movement, 1918, formulating minimum standards for approval and starting periodic surveys; 2,806 hospitals in United States, Canada and other countries were on the 1940 approved list; 345 cancer clinics in hospitals were approved in 1940 and 937 medical services in industry were approved in 1940. An approved list of medical motion picture films is also issued yearly. The college maintains a medical library and literary research department. The committee on graduate training for surgery (general surgery and the surgical specialties) was organized in 1937. Committees on cancer, archives of cancer, bone sarcoma, fractures and other traumas, and the Hall of the Art and Science of Surgery, function through a department of clinical research. Sectional meetings were held in 1940 in Los Angeles, Calif.; New Orleans, La.; and Detroit and Ann Arbor, Mich. The 30th Annual Clinical congress and the 23rd Annual Hospital Standardization conference, attended by 3,000 surgeons and 1,500 hospital executives, were conducted by the college in Oct. 1940, in Chicago. (M. T. M.)

American Council on Education: see EDUCATION; UNIVERSITIES AND COLLEGES.

American Economic Association. The purpose of the American Economic association (founded in 1885) is to encourage economic research, issue publications on economic subjects, and stimulate thought and discussion of current problems from an economic point of view. The publications of the association consist of a quarterly, the *American Economic Review*, the proceedings of the annual meetings, occasional monographs on special topics and a biennial handbook or directory of its membership. The program of the 53rd annual meeting of the association, held in New Orleans, La., in Dec. 1940, was devoted to the treatment of current, vital economic problems in retrospect and prospect, economic regionalism and economic research.

Officers for the year 1941 are: president, Sumner H. Slichter, Harvard university; vice-presidents, James C. Bonbright, Columbia university; Walton H. Hamilton, Yale university; secretary-treasurer, James Washington Bell, Northwestern university; elected members of the executive committee, Stacy May, Rockefeller foundation; Edwin E. Witte, University of Wisconsin; N. S. B. Gras, Harvard university; Ray B. Westerfield, Yale university; J. Douglas Brown, Princeton university; George W. Stocking, University of Texas. Membership, as listed in the handbook of the association, numbering approximately 3,000 (an additional 1,300 libraries and other subscribers are not included), constitutes a veritable "who's who" of American economists.

American Ethnology, Bureau of: see SMITHSONIAN INSTITUTION.

American Federation of Labor. Founded 60 years ago by the late Samuel Gompers and his associates, the American Federation of Labor has had many vicissitudes. During depression periods there have been some who despaired of further progress by the organization, but somehow the federation always managed to weather these depressions. The years 1930 to 1933 found the A.F. of L. ill-equipped to meet the impact of such an unprecedented depression. Funds ran low, unemployment took toll of membership, and leaders were discouraged. However, the enactment by congress of the National Industrial Recovery act stimulated workers to join unions because a provision of that law guaranteed the right of

collective bargaining. A wave of unionization followed and many who had never joined labour organizations did so in the brief period that remained to the act before the supreme court invalidated it.

A slump followed this court action, but a wave of unionization again developed in 1935 after the National Labor Relations act was passed by congress.

Hardly had the new collective bargaining law become operative, however, when the Committee for Industrial Organization was formed. This committee stressed the idea of forming unions on an industry-wide pattern, with all workers in a plant members of one local union. The A.F. of L. had emphasized the separation of unions into skilled craft groups, although it also included in its affiliates industrial and semi-industrial unions.

The split between the A.F. of L. and the C.I.O. resulted in a defection of approximately 1,000,000 members. This seemed a disaster at the time, but in its 1940 report at the New Orleans convention the federation announced that it had more than made up its loss and had reached a record membership of approximately 5,000,000. Two significant things occurred in 1940 to affect the A.F. of L. The International Brotherhood of Teamsters became the first in membership of all A.F. of L. unions and the International Ladies' Garment Workers which had been affiliated with the C.I.O. returned to the federation.

William Green of Ohio, president since 1924 (successor to Mr. Gompers), was re-elected. For the second time George Meany of New York was elected secretary-treasurer. (See also CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES: *History*.) (L. Sta.)

American Federation of Teachers: see EDUCATION: *Education and National Defence*.

American Geographical Society. In addition to its regular quarterly periodical, the *Geographical Review*, and *Current Geographical Publications*, a classified list, published monthly, of accessions to its research catalogue, the American Geographical society issued the following publications: a monograph, "Inner Asian Frontiers of China," by Owen Lattimore; a monograph in mimeographed form, "A Series of Population Maps of the Colonies and the United States, 1625-1790," by H. R. Friis; and 13 sheets of the map of Hispanic America on the scale of 1:1,000,000, bringing the total number of published sheets of this 107-sheet map, on which the society has been engaged for the past 20 years, to 101. A revised edition of "Environment and Conflict in Europe: Eighteen Basic Maps," first issued in 1939, was also published and editorial work was completed on two books to be published early in 1941: *Focus on Africa*, a volume of aerial photographs and descriptive text, by Dr. Richard U. Light, and *The European Possessions in the Caribbean Area*, by a number of authors, mostly members of the society's staff.

The work of the department of mathematical geography was devoted chiefly to development of a stereoscopic map-plotting machine on which this department had been engaged for a number of years, and that of the department of exploration and field research, to the plotting of topographical maps from aerial photographs taken on expeditions sponsored by the society in the Yukon and in the Sierra Nevada de Santa Marta in Colombia, South America. In connection with the commemoration of the 500th anniversary of the invention of printing from movable type, a special exhibit was set up in the society's building of books and maps illustrating critical steps in the development of geography in the United States, and a descriptive catalogue of the exhibit, entitled *Milestones in American Geography*, was issued. The Cullum Geographi-

cal medal was awarded to Robert Cushman Murphy, curator of oceanic birds at the American Museum of Natural History, and the Charles P. Daly medal to Carl O. Sauer, professor of geography at the University of California. (R. R. P.)

American Historical Association was incorporated by act of congress in 1889 "for the promotion of historical studies . . . and for kindred purposes in the interests of American history and of history in America." It had (Jan. 1, 1941) a membership of about 3,573, chiefly recruited from the teachers and writers of history in U.S. and Canadian schools and colleges. Its national headquarters were in 1940 at Study Room 274, Library of Congress annex, Washington, D.C., but its chief administrative officer, the executive secretary, had offices at 226 South 16th street, Philadelphia, Pa. It was governed by a council elected at the annual meeting and supported by annual dues (\$5) and by the income of an endowment fund of about \$250,000. Its officers for the year 1941 were: president, James Westfall Thompson, professor emeritus of the University of California; first vice-president, Arthur M. Schlesinger, Harvard university; second vice-president, Nellie Neilson, Mt. Holyoke college; treasurer, Solon J. Buck, the National Archives; executive secretary, Conyers Read, University of Pennsylvania.

During the year 1940 it continued the publication of *The American Historical Review*, the leading historical journal in the U.S., and participated in the publication of *Social Education*, devoted to the problem of teaching the social studies in the school. It also published in 1940 *James VI of Scotland and the Throne of England*, by Helen G. Stafford; and *Proceedings* for 1938, printed by the United States government. (C. Rd.)

American Indians: see INDIANS, AMERICAN.

American Institute of Architects. Founded in 1857, the American Institute of Architects is the national organization of the architectural profession in the United States. It is composed of upwards of 3,000 individual members, each of whom is a qualified architect. The members are grouped in 71 local chapters and 16 state associations. Through these organizations more than 8,000 architects of the United States are under its aegis. The objects of the organization are: To organize and unite in fellowship the architects of the United States; to combine their efforts so as to promote the aesthetic, scientific and practical efficiency of the profession; to advance education in architecture and in the arts and sciences allied therewith, and to make the profession of ever-increasing service to society.

The officers of the institute for 1940 were: president, Edwin Bergstrom, Los Angeles; vice-president, Walter R. MacCornack, Boston; secretary, Charles T. Ingham, Pittsburgh; treasurer, John R. Fugard, Chicago. Its headquarters are at 1741 New York avenue, N.W., Washington, D.C., operated jointly with "The Octagon," a colonial building of 1800, the latter as an historic monument.

American Iron and Steel Institute. The publication and distribution of books and pamphlets continued to be prominent among the activities undertaken in 1940 by the American Iron and Steel institute in promoting the interests of members of the iron and steel industry in the United States. Certain publications, such as the statistics of iron and steel production, the account of the general meeting of the institute and the periodical, *Steel Facts*, represented continuations of series. New publications included

several sections of a manual covering definitions and descriptions of iron and steel products and booklets relative to the uses of steel in agriculture, and to the financial investment in, and earnings of, the steel industry. The institute likewise continued during 1940 its work of compiling and publishing a series of freight tariffs showing freight rates on iron and steel products from important origin points to principal destinations. Another important activity was the providing of accurate information relative to the industry. Thousands of inquiries from editors, writers, students and the public generally were answered by members of the institute staff during 1940. In connection with the national defence program, the institute was co-operating closely with the national defence advisory commission, with the war and navy departments and other government bodies. (W. S. To.)

American Judicature Society. The American Judicature society was founded in 1913 to promote the efficient administration of justice. Its first work was publication of a series of bulletins surveying the fundamental operations of judicial administration. The bi-monthly *Journal* has been published since 1917, and is sent free to all who wish to receive it. The society takes the entire range of judicial administration, civil and criminal, state and federal, as its field, and endeavours to present information concerning means for improvement of court and bar organization, judicial selection and tenure, civil and criminal procedure, and legal education and admission to the bar. Its publications have formed the foundation for virtually every reform accomplished and now under way in its field. During its first 12 years it was supported entirely by Charles F. Ruggles, a layman. In 1940 it had about 2,000 members, nearly all lawyers and judges. Membership is open to all, with dues at \$5 a year. The society works in close conjunction with the American Bar association and with state and local bar organizations, all of which its *Journal* serves in the field of judicial administration. President of the society in 1940 was David A. Simmons, Houston, Tex., who was preceded in office by Arthur T. Vanderbilt, Frank E. Atwood, Newton D. Baker and Charles Evans Hughes. Herbert Harley has been secretary since it was founded. Its office is in Hutchins hall, University of Michigan, Ann Arbor, Mich. (H. HAR.)

American Law Institute. Since its organization, the chief work of the American Law institute has been a *Restatement of the Law*, best described as an orderly statement of the present common law. While the sections into which the restatement is divided are written in statutory form, they are not presented to legislatures for adoption. The object of the restatement is to clarify and simplify the common law, but not to prevent its continued development by judicial decision. Prior to 1940, 14 volumes of the restatement were published, including the law of contracts, conflict of laws, agency, trusts, and restitution, besides large portions of the law of property and torts. During 1940 work on the restatement of the subjects, judgments, security and the fourth volume of the restatement of the law of property went forward. The institute was also engaged on two other projects of importance—the drafting of a model code of evidence and statutes dealing with the administration of the criminal law in so far as it affects youths between 16 and 21 convicted of crime. A model statute creating a treatment board to which such convicted youths will be sentenced was adopted at the annual meeting in May and steps have been taken to secure its consideration by state legislatures.

The American Law institute was organized in Feb. 1923. Its object is to carry on constructive scientific work for the improvement of the law. Aside from the official members, who are those

holding the leading judicial, bar, and law school faculty positions, there are 725 life members; membership being a distinct professional honour. The governing body is a council of 33. The members meet each year in Washington, D.C. All legal and other official publications of the institute must be first approved by the council and by a meeting of members. The president is George Wharton Pepper; William Draper Lewis is director and chief of the editorial staff. The executive office is at 3400 Chestnut street, Philadelphia, Pennsylvania. (W. D. L.)

American Legion. In 1940 when congress authorized the expenditure of \$17,000,000,000 for military and naval uses, the American Legion's 21-year-old objectives for an adequate national defence were acknowledged as having been sound. The Legion achieved some of its aims for the internal defence through enactment of legislation requiring registration of all aliens, and through the continuation for the third year of the Dies Congressional committee for the investigation of subversive activities.

There was further expansion of the Legion's youth-training activities, with 62,000 pupils in 40 states participating in a nationwide high school oratorical contest; 15,000 selected boys enrolled in 34 boys' schools in which they were taught the mechanics of American self-government; and with 400,000 boys under 17 years of age playing in the nationwide junior baseball program. Child welfare, with the long-range program, continued seeking liberalized benefits for needy children in the state social security program, while the immediate program again was devoted to extending financial aid from Legion and other sources, amounting to \$4,647,682.87 for 454,495 needy children; a rehabilitation program recovered grants totalling \$3,255,498.96 in contested benefits for disabled veterans and their dependents. Membership was the highest in the history of the American Legion and its four affiliated organizations. The number of posts reached a new high.

The 22nd annual national convention was attended by 300,000 members and their families in Boston, Mass., Sept. 23 to 26, 1940. The convention went on record for all practicable aid to Great Britain and those aligned with her in their fight for freedom.

From resolutions adopted by the Boston convention, the national executive committee, at Indianapolis, Nov. 21 and 22, selected the following major national legislative program for 1941:

(1) National defence, (2) government protection for World War widows and orphans, (3) civil service, veterans' preference and employment, (4) Americanism, including further restriction of immigration, continuation of the Dies committee and increasing of the personnel of the FBI.

The 1,451 official delegates, representing 58 continental and outlying departments, and four posts not attached to any department, named Milo J. Warner, Toledo, Ohio, attorney, to succeed Raymond J. Kelly, Detroit, Mich., as national commander, and chose Milwaukee, Wis., as the 1941 convention city.

*New high. †Decrease.

National headquarters of the American Legion, and of its affiliated organizations, the American Legion auxiliary, the Forty and Eight, and the Sons of the American Legion, remained at the War Memorial building, Indianapolis. The Eight and Forty has headquarters elsewhere in Indianapolis. Frank E. Samuel, national adjutant, and principal administrative officer of the American Legion, was re-elected by the national executive committee at its meeting in Boston, immediately following adjournment of the national convention. (M. J. W.)

American Library Association, the official organization of librarians in the United States and Canada, consists of librarians, library trustees, and others interested in libraries. Founded in 1876, it functions through a headquarters staff of over 85 persons and through 600 members of 70 voluntary boards and committees. International in character from its beginning, the association had representatives from every major country in its 1940 membership, which numbered 16,000.

The oldest and largest association of its kind, it is affiliated, formally or informally, with more than 50 other library associations in the United States and other countries and many national and international educational, civic and patriotic organizations and associations. Essae M. Culver, Baton Rouge, La., was president in 1940 and Carl H. Milam, executive secretary. The A.L.A. headquarters is located at 520 North Michigan avenue, Chicago.

Complete and adequate library coverage for the United States and Canada is one of the chief objectives of the A.L.A. In 1940 approximately 47,000,000 people in the two countries—most of them in rural areas—were without access to public library service. Other important objectives are: "to assist libraries to operate with the utmost economy and efficiency; to improve the status of librarianship; to build for the future of library service by drawing into the profession some of the best qualified young men and women; and to promote studies which will tend to establish on a solid foundation the library's place in the governmental and social structure."

Standards of training for librarians are set by the association and a free employment service is offered to libraries and individual librarians. The total income for the fiscal year was about \$372,000. The association's endowment was (Aug. 31, 1940) approximately \$2,152,000.

Six periodicals are issued by the association: *A.L.A. Bulletin*, a monthly which includes the annual reports, the conference proceedings, and the yearly handbook; the *Booklist*, a semi-monthly guide to the selection and purchase of current books; the *Subscription Books Bulletin*, a quarterly presenting critical estimates of subscription books and sets sold currently by canvassing agents; the *Journal of Documentary Reproduction*, a quarterly giving developments in microphotography and related techniques; *College and Research Libraries*, a new quarterly, the official publication of the Association of College and Reference libraries; and the *Hospital Book Guide*, a new quarterly, sponsored jointly by the Hospital Libraries committees of the American Hospital association and the A.L.A. In addition, the association published 29 professional books and pamphlets during 1940; a few outstanding titles include: McDiarmid's *The Library Survey*; Horton's *Buying List of Books for Small Libraries*, 6th ed.; Branscomb's *Teaching with Books*; Shaw's *List of Books for College Libraries*, 1931-38; Wilcox's *Manual on the Use of State Publications*, and six book lists to be used in conjunction with the national defence program.

Over 3,000 librarians and friends of libraries from the United States, Canada and other countries attended the 62nd annual

A.L.A. conference held in Cincinnati, May 26 to June 1, 1940 when 58 awards were made. James Daugherty received the 19th Newbery medal, for the most distinguished contribution to children's literature published during 1939, for his book, *Daniel Boone*; Ingri and Edgar Parin d'Aulaire won the third Caldecott medal for their distinguished picture book, *Abraham Lincoln*; 52 librarians were cited for outstanding examples of special library publicity issued during 1939; and the editors of the *Christian Advocate*, the *Christian Science Monitor*, *Scholastic Magazine* and *This Week* were commended for distinguished service during the year in interpreting the library to their readers. Honorary membership was conferred upon Dr. Frank Pierce Hill, a past president of the A.L.A. and member of the association since 1883 and Dr. Herbert Putnam, twice president of the association and librarian of congress for 40 years. The 1940 midwinter conference was held in Chicago, Dec. 27 to 30 and the annual conference was scheduled for Boston, June 19 to 25, 1941.

Library developments during 1940 included: continuation of support of legislation for federal and state support of libraries; reorganization of the A.L.A. through revision of its constitution and bylaws; direction of a Rockefeller foundation grant for a three-year project providing U.S. books for selected popular libraries in Denmark, Eire, England, Finland, France, the Netherlands, Norway, Sweden and Switzerland and a grant for a three-year project covering work and studies on library co-operation with Latin America; adoption of a policy statement on "Libraries and the War in Europe"; co-operation with other groups in behalf of national defence and democracy; collaboration with a national broadcasting company on programs which are broadcast to Canada and Latin American countries with scripts in Spanish as well as English; publication of lists of Portuguese and Swedish books; making of library surveys; observance of the world-wide celebration during 1940 of the 500th anniversary of Gutenberg's invention of movable type and collection of books for the college and university libraries in the interior of China. (M. O. P.)

American Literature. The year 1940 had several notable features, the most striking of them the large number of established novelists who produced works of greater or less magnitude. Also noticeable in the field of fiction was the continued popularity of the historical novel, the only

discernible trend at present. Nostalgia for rural and small-town life of the past, which got under way in 1939 with the success of Bellamy Partridge's *Country Lawyer*, spawned shoals of books that might have been lumped under the general title *Life With Father*, needing only sub-titles to explain their exact nature. There was a noteworthy increase in the number of books about South America, the first wave of a tide set in motion by war-born Pan-Americanism.

The event of the year in the novel was the comeback of Ernest Hemingway, whose *For Whom the Bell Tolls*, published in the autumn, was the champion best seller and seemed destined to touch the million mark before its sale ended. A tale of the Spanish Civil war, it was by universal agreement the best work of its author, and quite good enough to wipe out the memory of his failure in *To Have and Have Not*.

A Farewell to Arms appeared to be the only one of his previous books with which it could be compared in stature, and while its love story was no more than conventional, its pictures of men and women at war, in imminent and constant peril, were unforgettable, and its close-to-the-bone account of the life of a young American in the Loyalist service was vivid to the last degree.

The last bit of evidence in the case of Thomas Wolfe was handed to the jury with the publication of the second of two posthumous novels, *You Can't Go Home Again*. Many reviewers saw in it evidence that Wolfe was well on his way to bridling the tornado and saddling the tempest, and it was, indeed, a more quietly written and much better organized novel than its predecessors. But its subject matter remained strictly autobiographical, and, like all the other Wolfe books, it was both very good and very bad. What this gifted writer might have accomplished will always remain a subject of controversy, although what he left behind may be measured without embarrassment against the whole body of work of any other American novelist, living or dead.

Willa Cather, silent since *Lucy Gayheart*, which most of her admirers considered one of her poorest books, turned backward to her native Virginia for *Sapphira and the Slave Girl*, a cool and delicate and skilfully simple story of ante-bellum days in the Old Dominion. It was decidedly Miss Cather's best novel since *Death Comes for the Archbishop*, and in some respects nearer to the true novel than that beautiful idyll. A few critics rated it slightly below the best of her earlier books, but the general inclination was to place it among the top three or four, in spite of the obvious weakness of the ending.

THE GLORY OF CONCORD, Mass., U.S. literary shrine where Hawthorne, Thoreau, Emerson and the Alcotts made their homes, was recalled by Van Wyck Brooks's scholarly *New England: Indian Summer*, published in 1940

No single book blanketed the field of non-fiction in 1940, although Anne Lindbergh's plea for peace, *The Wave of the Future*, swept the country and aroused violent controversy as a reputed argument for appeasement, at a time when the war spirit was rising higher by the hour. Van Wyck Brooks's *New England: Indian Summer*, a sequel to *The Flowering of New England*, also enjoyed widespread popularity and found a warm critical reception. There were some outstanding events in history and biography, but the production here fell somewhat below the average level. The swift movement of events in Europe and the narrowing of the international scene to the conflict between Great Britain and the axis partners wiped out the market for books on world affairs in general. All-out war efforts in the United States had not gone far enough when the year ended to produce a literature, except for a sprinkling of manuals on *How to Become a Soldier*.

In history, the event of the twelve-month was the publication of a five-volume *Dictionary of American History*, edited by James Truslow Adams, and containing contributions on virtually every subject under the sun from the pens of leading authorities, a very complete and up-to-date set.

Among biographies the most important was Allan Nevins's *John D. Rockefeller: The Heroic Age of American Enterprise*, a fair-minded appraisal in two volumes of the founder of Standard Oil. The indefatigable Dr. Nevins appeared to have unearthed all the facts and to have been steadfastly determined not to allow any prejudice to creep into his pages. One left-wing critic called the book "an academy portrait" and others thought Dr. Nevins's knowledge of economics insufficient to fit him for final judgment of Rockefeller and his works, but none failed to praise him for his scholarship, his good writing and his objectivity.

The year was not at all notable in poetry, although it brought a fine volume from Elizabeth Madox Roberts, the first in several years, *Song of the Meadow*. Edna St. Vincent Millay's *Make Bright the Arrows* consisted of topical verse that often descended to the level of commonplace prose, while Muriel Rukeyser's *A Turning Wind* marked no advance over her previous work, and Frederic Prokosch's *Death at Sea*, greatly influenced by Auden, was often effective without ever attaining any real heights. Creditable enterprises in the translation of Spanish poetry were the publication of two volumes, Federico Garcia Lorca's *The Poet in New York*, and Pedro Salinas's *Truth of Two*. Rolfe Humphries translated the former, the work of Spain's greatest contemporary poet and playwright, who was assassinated by followers of Franco, and Eleanor Turnbull the latter. Also there was published *The Selected Letters of Edwin Arlington Robinson*, a revealing collection of interest to all lovers of Robinson's poetry.

Novels.—Kenneth Roberts, by now the leader in the popular field of the historical novel, produced one of his major works in *Oliver Wiswell*, which also promised as the year ended to be one of his most popular books. A story of the revolution with a Tory hero, it again gave evidence of Mr. Roberts's sturdy independence of point of view, his notable ability at vividly recreating the past, his thorough scholarship and the all-around readability of his work. Although *Oliver Wiswell* was beyond question the outstanding historical novel of the twelve-month, it had an abundance of company and there was no sign of any abatement of the nation's burning interest in its past.

Among some of the better books in this crowded category were Lella Warren's *Foundation Stone*, a long and lively, if not very well written, story of early days in Alabama; Iola Fuller's *The Loon Feather*, with a charming Indian girl for its heroine, the daughter of Tecumseh; Van Wyck Mason's *Stars on the Sea*, a rousing yarn of the early days of the navy; Neil H. Swanson's *The Silent Drum*, a unit in a tremendous historical panorama Mr. Swanson is engaged upon, and unusually good reading; Helen

Todd's *A Man Named Grant*, a notable attempt at portraiture in fiction; Bruce Lancaster's *For Us the Living*, with Lincoln as the central figure; and Walter Van Tilburg's *The Ox-Bow Incident*, a relatively slight but very skilful story of cattle rustling, which was popular.

Others from a long list that deserve special mention include John Erskine's *Give Me Liberty*, with Patrick Henry as its hero; Clark McMeekins's *Show Me the Land*, early days in Kentucky; Archie Binns's *Mighty Mountain*; Laura Krey's *On the Long Tide*; Mildred Walker's *The Brewer's Big Horses*; Inglis Fletcher's *Raleigh's Eden*; Stewart Edward White's *Wild Geese Calling*; Harold Sinclair's *Westward the Tide*; Louis Zara's *The Land Is Ours*; Evelyn Eaton's *Quietly My Captain Waits*; Conrad Richter's *The Trees*; Walter D. Edmonds's *Chad Hanna*; Isabel Paterson's *If It Be Fair Weather*; and Gwen Bristow's *This Side of Glory*.

To return to the matter of established novelists and their current productions, William Faulkner's *The Hamlet*, a novel of poor whites, the Snopeses, was much better than its immediate predecessor, *The Wild Palms*, although it showed no particular advance for Mr. Faulkner's art otherwise. Some of the characters' names sounded like burlesques. Erskine Caldwell's *Trouble in July*, his first novel for some time, was of no especial importance, while Sinclair Lewis's story of the theatre, *Bethel Merriday*, left the author of *Main Street* with his reputation unredeemed from the flat failure of *The Prodigal Parents*. Pearl S. Buck's *The Other Gods*, obviously based on the Lindbergh story, was one of her minor works, but proved that she can write worthy American novels; Louis Bromfield's *Night in Bombay* was second rate and popular Bromfield; while Upton Sinclair's *World's End*, one of the most popular of all Mr. Sinclair's many novels, was a well put together propaganda story of the World War of 1914-18, enlivened with innumerable anecdotes and very readable, if not very important as literature. Hans Otto Storm's *Count Ten*, cut to the biographical pattern, was a larger novel, and a fuller, richer one, than Mr. Storm's previous efforts, which have won him many admirers.

Another event of the year was the return of Glenway Westcott with a novelette called *The Pilgrim Hawk*, his first piece of long fiction in many years, or since *The Grandmothers*, and a brilliant tour de force that promised well for the second stage of this talented writer's career, which came to a curious and abrupt halt after a most striking beginning.

Among the younger novelists, Richard Wright, a Negro, scored a smash hit with *Native Son*, the story of a Chicago boy driven to crime and eventually to death by racial discrimination. A melodramatic theme, which was handled with a good deal of skill, helped to put the book over, although it was hardly so successful as an artistic achievement as Mr. Wright's long short story volume, *Uncle Tom's Children*. Carson McCullers's *The Heart Is a Lonely Hunter* was the most discussed first novel of the year, and a strangely mature and original book to have been written by a young woman of 22.

James Still's *River of Earth* was a simply told and moving story of mountain folk, and Jesse Stuart made a good job of somewhat similar material in *Trees of Heaven*. James Street's *Oh, Promised Land* marked an impressive beginning of a career as an historical novelist, and others of the younger writers who produced creditable books included Paul Corey, with *The Road Returns*; James Robert Perry, with *God Rides a Gale*; Dan Wickenden, with *Walk Like a Mortal*; and Wallace Stegner, with *On a Darkling Plain*. Two noteworthy novels by young writers of Italian descent, concerned with Italians in this country, were *Dago Red* by John Fante, and *Olives on Apple Trees* by Guido Agostini. Kay Boyle's book of short stories, *The Crazy Hunter*, had great distinction

AMERICAN AUTHORS of successful books in 1940: Van Wyck Brooks (*New England: Indian Summer*); Kenneth Roberts (*Oliver Wiswell*); John T. Flynn (*Country Squire in the White House*); Mortimer J. Adler (*How to Read a Book*); Ernest Hemingway (*For Whom the Bell Tolls*)

and was the most notable collection of its kind. William Saroyan's *My Name Is Aram* was another collection worth noting.

Biography.—Aside from Dr. Nevins's life of John D. Rockefeller, the year was not noteworthy in lives of great Americans, although it produced Claude M. Fuess's *Calvin Coolidge: The Man from Vermont*; George S. Hellman's *Benjamin N. Cardozo: American Judge*; John K. Winkler's *Five and Ten: The Fabulous Life of F. W. Woolworth*; Stewart Holbrook's excellent *Ethan Allen*; Ola Elizabeth Winslow's *Jonathan Edwards*; and O. L. Marsh: *Pioneer in Paleontology*, by Charles Schuchert and Clara Mae La Vene, the life story of the man who introduced dinosaurs to the great American public. The list shows that there was at least no lack of variety. Nathaniel Wright Stephenson's two-volume *George Washington* and Bernard Knollenberg's *Washington and the Revolution* were two important contributions to the study of the father of his country, the latter somewhat iconoclastic, especially in its attacks upon other historians, but both destined to take a lasting place on the Washington shelf. A biography of a little known but highly important member of the Lincoln circle in Washington was Marjorie Barstow Greenbie's *Dear Lady: The Story of Anna Ella Carroll*. Mrs. Carroll, it seems, was a southern woman who played a tremendous part in the Lincoln administration, although her name does not even appear in histories of the period.

The list of autobiographies is more impressive in quality. It contains Hans Zinsser's *As I Remember Him: The Biography of R.S.*, a fine book about a scientist who died shortly after it was published; Abraham Flexner's *I Remember*, the story of great foundations and their work; *The Confessions of an Individualist* by William Henry Chamberlin, one of the best of living foreign correspondents; Ernest Thompson Seton's *The Trail of an Author-Naturalist*; Alice Hegan Rice's *The Inky Way*; and *Dusk of Dawn* by W. E. D. Du Bois, the stirring life story of a great Negro educator and publicist.

History.—There were a number of additions to the flourishing *Rivers of America* series during the year, and a new series of informal histories of the states got under way with Phil Stong's *Hawkeyes*, done in his best vein and making a good start for an interesting project. Foster Rhea Dulles's *America Learns to Play: A History of Popular Recreation*, told the country's story through its games, with pictures, while David L. Cohn's *The Good Old Days* did the same thing through the medium of Sears, Roebuck catalogues.

Frederick Lewis Allen continued his informal history of our own times with *Since Yesterday: The 1930's*; Fred Lewis Pattee covered a period of our literary history in his *The Feminine Fifties*; and Ernest Sutherland Bates, who died shortly after the book was published, made a fine contribution in his *American Faith: Its Religious, Political and Economic Foundations*. Two new books written around Lincoln were George S. Bryan's *The Great American Myth*, a painstaking exploration of the facts concerning the assassination and its sequels; and Otto Eisen-

schiml's *In the Shadow of Lincoln's Death*, which revived all the odd and curious rumours afloat at the time and gave much more credence to most of them than they deserve.

Coronado's Quest by A. Grove Day told anew the story of the discovery of the southwestern states by the Spaniards, with a wealth of detail and in a readable style. Edmund Wilson's *To the Finland Station* was a brilliantly written history of socialism, interlaced with biographies and containing a section devoted to Lenin and Trotsky. The subtitle was *A Study in the Writing and Acting of History*, and the book proved to be an exciting intellectual adventure.

Nostalgia.—This heading covers a whole assortment of books about the back country past and includes volumes about editors, horse doctors, lawyers, preachers and schoolteachers, written mostly by fond sons who have found family memories a surprising source of revenue. Others are by living practitioners of the art of living in the country, and liking it. This long list includes among its better selections, Henry Beetle Hough's *Country Editor*, Clayton Rand's *Ink on My Hands*, and Joshua K. Bolles' *Father Was an Editor*, to begin with journalism; *One Foot in Heaven: The Life of a Practical Parson* by Hartzell Spence (son), and George B. Gilbert's *Forty Years a Country Preacher*; *The Doctor and His Patients* by Arthur B. Hertzler; *Frontier Doctor* by Wiling C. Coe; *Hoss Doctor: The Memories of a Country Vet* by R. J. Dinsmore; and *Horse and Buggy Daze* by Irving B. Tressler, a spoof on the fad. Also *Schoolmaster of Yesterday* by Millard Fillmore Kennedy and Arthur F. Harlow; *Family Crisis* by Sherlock Bronson Gass, whose family once ran a laundry; *How Dear to My Heart* by Mary Margaret McBride; and last, but not at all least, Rebecca Yancey Williams' *The Vanishing Virginian*, which is *Life with Father* on the other side of the Mason and Dixon line, and a delightful portrait of a Virginia gentleman of the old school, done by his daughter.

Pan-America.—The rapid development of a closer relationship between the United States and Central and South America was evidenced in the number of books published concerning Pan-Americanism as a working doctrine. Among the best of these was Duncan Aikman's *The All-American Front*, revised during the year, and giving a complete survey of the South American situation as viewed by a shrewd reporter; Mr. Aikman was under no delusions about the difficulties of closer relationships with the sister republics, but thought the United States should make an intelligent effort, and tried to point the way without being dogmatic. Carleton Beals's *Pan-America* was another well informed volume on the same subject, although written with a more definite bias than Mr. Aikman's book, and therefore to be read more critically.

Vera Kelsey's *Seven Keys to Brazil* was a complete and readable study of the southern hemisphere, while Anne Merriman Peck's *Round About South America* again told the story cheerfully and attractively. Gregory Mason's *South of Yesterday* was a book of travel and archaeology, full of fresh information delightfully imparted; Ernest Young's *South American Excursion* was a travel book with much good descriptive writing in it; and Edwin F. Embree's *Indians of the Americas* gave part of its place

to the aborigines of other lands than the United States. Paul Russell Cutright's *Great Naturalists Explore South America* was of much wider interest than the merely scientific; and William Merriman's *Yankee Caballero* had several extraordinary stories of adventure in out of the way places in the Andes and up the Amazon.

As 1940 ended, reports were that North American writers were leaving in large numbers for South America, all of them intending to write books about it, and there were many plans underway for an exchange of the literary productions of the two hemispheres. A good novel based on life in two republics, probably Haiti and Santo Domingo, published as the year drew its last breath, was Harold Courlander's *The Caballero*. (See ENGLISH LITERATURE.)

(H. BL.)

American Medical Association. The American Medical association, founded in 1846 in Philadelphia, Pa., celebrated its 94th anniversary at its most successful annual meeting in June 1940 in New York city with an attendance of 12,864 physicians. The technical and scientific exhibits completely filled the Grand Central palace and the scientific sessions taxed the capacities of large meeting rooms where the newest advances of medicine and surgery were presented by distinguished experts. At the opening evening meeting a large audience was entertained by a symphony orchestra composed of 70 physicians.

The house of delegates, which is the policy-making body of the association and made up of representatives from every state and from the territories of Alaska, Puerto Rico, Canal Zone, Hawaii and the Philippines, was confronted with unusual problems growing out of the European war. The United States war department asked the help of the American Medical association in preparing for national defence, and the speaker was authorized to appoint a committee on medical preparedness, representing every military corps area.

The committee sent questionnaires to 175,000 physicians to discover how loyal, how willing and how available they might be. The response of more than 134,000 physicians exhibited the traditional devotion of the medical profession to public service. The skeletal fabric for military service was erected in every state, not only for field service and service in draft boards, but for the protection of civilians at home.

On Sept. 19 President Roosevelt appointed a health and medical committee of the council on national defence, composed of Dr. Irvin Abell, a former president of the American Medical association, chairman; the surgeons general of the army, the navy and the public health service; and Dr. Lewis H. Weed, chairman of the division of medical sciences of the National Health council. This committee was asked "to survey and co-ordinate the medical resources of the country in the interest of national defence." On Dec. 3 Paul V. McNutt, Federal Security administrator, was designated a "co-ordinator of all health, medical, welfare, nutrition, recreation and other related fields of activity affecting the national defence." This naturally transferred the work of all medical preparedness to one leadership.

Every activity of the association grew during 1940. The membership increased to 116,524; the circulation of the *Journal* to 101,323 weekly, and all the special *Journals* showed an increased number of subscribers.

Hygeia, designed for popular reading, brings timely developments in practical medical knowledge in lay language and reached in 1940 a reading public (estimated according to a recent survey) of approximately 2,000,000 persons.

The American Medical association is an educational institution. Through its council on medical education and hospitals it con-

tinued to exert the strongest influence in the U.S. to maintain the highest standards of medical education and the very best quality of medical service to hospital patients.

Its radio broadcasts carry proven medical information to all listeners. The association's continued efforts to educate all the people to resist the seductions of quackery has resulted in the flight from this field of some of the most conspicuous offenders. Some of these people brought legal actions against the association, but all were defeated.

More than 7,000,000 people visited the Hall of Health at the world's fair in New York city where an educational exhibit sponsored by the association was a leading attraction.

The woman's auxiliary of the American Medical association, with a membership limited to the wives of physicians, grew to 25,000 in 1940 and was organized in 38 states. Its objectives are educational through local and national public relations committees; the distribution of hygiene; the promotion of local and national health projects; and improvement of the social relations of all physicians. Anaemia. In 1939-40 increased attention was directed to the preservation of blood, plasma and serum for therapeutic purposes. Stored blood is inferior to fresh blood in the control of bleeding in jaundice (loss of prothrombin). Haemoglobin intravenously is nontoxic and increases blood haemoglobin quickly in emergencies. Further studies were made of vitamin K and synthetic substitutes in relation to haemorrhage. (Hypoprothrombinaemia; haemorrhagic disease of the new born.) Vitamin P does not alter fibrinogen, prothrombin or platelets, but is curative in vascular purpura. Female anaemic rats utilize ingested iron more efficiently than anaemic males. Cobalt appears to enhance the utilization of simultaneously ingested iron, accelerating erythropoiesis.

In milk anaemia in dogs, iron and copper mixtures are three times as effective as iron alone. Ingested, radioactivated iron appears in the red blood cells of anaemic dogs within four to eight hours. It is converted into haemoglobin in two to seven days. There is no exchange of iron types in *in vitro* mixtures with blood. Multiple small doses of iron are more efficient than single large doses.

Egg yolk is effective in erythropoiesis, but fish roe requires the addition of lactoflavin to be of value. Of the amino acids, glycine, glutamic acid, aspartic acid, cystine, histidine, phenylalanine and proline are the most active in producing haemoglobin in anaemia. A blood iron concentration below 20 mg. per 100 c.c. is of bad prognostic import. Haemolysins, intraperitoneally, induce a spherocytic anaemia in dogs, with increased fragility of the erythrocytes.

Nonacid secreting relatives of patients with pernicious anaemia are susceptible to the disease. The familial incidence is 7.9%. Gastric carcinoma is more common in these patients (3.86%) than in the general population (.3%). Patients receiving a year's supply of liver extract, intramuscularly, within one week, relapse in from 2 to 12 months. The optimal frequency of dosage is one to four weeks.

There appears to be no evident correlation between the pH of gastric secretions, the gastroscopic appearance of the mucosa, the presence or absence of a secretory depressant factor in the secretion and the blood count in pernicious anaemia. The erythrocyte increase after two weeks of therapy in pernicious anaemia is 0.78-0.174 E o (E o=initial erythrocyte count).

The electrocardiographic records in anaemia show low voltage. A familial, hereditary, haematopoietic disorder in Italians is characterized by hypochromic, microcytic erythrocytes with increased resistance to salt solutions, splenomegaly, bilirubinaemia and urobilinaemia.

In benzene poisoning, aplastic anaemia is more frequent in man than in animals. Anaemia is common in benzol poisoning in the rotogravure industry. Acute haemolytic anaemia may characterize naphthalene poisoning. A mild, slowly developing haemolytic anaemia (fall of 20% in haemoglobin in the first ten days) occurs in 3% of adults treated with sulphanilamide.

Anaesthesia. The advances in anaesthesia during the year 1940 were few. One of the most important was the introduction of the Horton intercoupler, a device by which static electricity, which might cause explosions in the gas machine, is brought under relatively good control. This device is a series of wires intercoupling the anaesthetist, the table and the gas machine with a resistance of 1 megohm, which prevents the static electricity from travelling from one object to another rapidly enough to cause a spark. With this device available, the use of cyclopropane, ethylene and other explosive mixtures of anaesthetic agents has been brought reasonably well under control. These gases are being used with more confidence than before. Further investigations of the properties of cyclopropane have established the fact that otherwise explosive combinations of cyclopropane and oxygen may be made nonexplosive by dilution with inert gases such as helium, nitrogen and air. Romberger and his associates worked out the problem and concluded that there are conditions under which cyclopropane is not explosive when combined with nitrogen or air. Even mixtures of cyclopropane and ethylene have been found by Horton and others to be less explosive than either agent alone.

A valuable contribution was made by Lemmon, who suggested the use of what he called "continuous spinal anaesthesia." This is made possible by the use of a very soft needle that will not break and by connecting to it a small firm rubber tube about 2 feet (61 cm.) in length, through which a solution of procaine hydrochloride or any other spinal anaesthetic may be injected from time to time.

This method permits long anaesthesia to be provided by procaine, which is no doubt the safest of all the spinal anaesthetic agents. It shows how valuable a contribution may be that permits a new and better use of an old and well established anaesthetic agent.

While intravenous anaesthesia was not new in 1940, its use spread considerably. In addition it has been used in combination with other agents and older methods with very satisfactory results to the users. It has been particularly valuable in connection with nitrous oxide and oxygen where noninflammable mixtures had to be used.

The agents pentothal sodium and evipal soluble are still the best of the local anaesthetic agents for intravenous use. Pentothal sodium seems to be the more popular of the two. The patients almost universally prefer these drugs for general anaesthesia to those given by general inhalation. Therefore, physicians often are encouraged to use this method in all operations regardless of the age of the patient. This use does not always ensure the greatest safety for the patient where the intravenous anaesthetic alone is depended on to provide all the necessary anaesthesia and relaxation that the surgeon needs. In some cases the attempt has been made to administer oxygen simultaneously with the intravenous anaesthetic because, when anaesthesia is deep, respirations are shallow and it has not been possible to safely provide profound enough anaesthesia by the intravenous method when patients inhale air. However, it has been possible to do so safely when the patient is inhaling oxygen.

Most anaesthetists do not care to push administration of the intravenous anaesthetic alone to such a point, since it may be combined to advantage with regional anaesthesia, inhalation anaesthesia and even rectal anaesthesia. These combinations will probably prove to be mutually advantageous; so it is to be hoped that they will be the means of a greater use of regional anaesthesia and at the same time relieve the patient of any memory of the injection of the local anaesthetic which has handicapped its use in the past.

It seems generally conceded that preliminary medication may be used to advantage before intravenous as well as before inhalational anaesthesia. There is reason to think that the use of barbiturates such as pentothal sodium prior to the administration of such a gas as cyclopropane gives the patient some protection against cardiac disturbances during cyclopropane anaesthesia.

It is generally conceded that the use of a 2.5% solution of pentothal sodium is better than the use of a 5% or 10% solution from the standpoint of prevention of thrombophlebitis. Many mechanical devices have been prepared for the administration of the drug after the needle has been fastened into the vein so that one individual may attend the patient's head as well as inject the solution into a vein in an extremity. The opinion has been freely expressed that the intravenous method will find extensive military medical uses.

Another activity in the field of anaesthesia that was not exactly new in 1940 was the aspiration of material from the tracheobronchial tree during and after operation. Where atelectasis occurs as a result of the occlusion of a bronchus by a plug of mucus or other material, the relief of the condition is sudden and dramatic when the material has been aspirated from the tracheobronchial tree through either a laryngoscope or a bronchoscope. The use of a bronchoscope entails much more experience and practice than the use of a laryngoscope.

While the method was not new in 1940, nevertheless much progress has been made in demonstrating its value, and it, too, is being more widely used than before, although progress in this direction is slow. (See also SURGERY.)

Anderson, Mary (MADAME ANTONIO F. DE NAVARRO) (1859-1940), U.S. actress, was born in Sacramento, Calif., July 28, and died in Broadway, England, May 29. For a biographical sketch see *Encyclopædia Britannica*, vol. 1, p. 899.

Andrews, Charles Freer (1871-1940), English missionary in India, was born in Newcastle-on-Tyne, England, Feb. 12. He was educated at Pembroke college, Cambridge, and in 1896 went to London as the head of the Pembroke college mission to the slums. He went to India in 1904 to join the Cambridge Brotherhood at Delhi and was made a fellow of Punjab university in 1908. He became a close friend of Gandhi and co-operated with him in an attempt to bring about harmonious relations with the British. He became connected with Rabindranath Tagore's institute at Santiniketan, 100 mi. from Calcutta, in 1913 and was its president when he died. He was active in the settlement of the problem of Hindu labour in South Africa and in British Guiana. He wrote a biography of Gandhi and two other books dealing with his ideas and plans, as well as several books on the Christian religion. He died in Santiniketan, April 4.

Angling. Three new world's records were set during the 1940 salt-water season. The most outstanding of these was the new record broadbill swordfish which was caught by E. S. Tucker at Tocopilla, Chile. This huge broadbill, which weighed 860 lb., made Mr. Tucker the record holder for the second time in his angling career. He first established the broadbill record in 1933 with an 837½-pounder, but was displaced by his fishing partner, G. W. Gary, who caught an 842-lb. broadbill in 1937. Tucker regained the world's record when he landed the 860-pounder on April 28, 1940.

The giant bluefin tuna world's record was broken for the third time in two years when Dr. John B. Vernaglia landed a 927-lb. specimen at Ipswich bay, Mass., on Aug. 25, 1940. The record had been broken twice in 1939, both times by tuna caught in Nova Scotia waters. Dr. Vernaglia's catch returned the record to the coastal waters of the United States for the first time in a number of years.

The third salt-water record was established at Galveston, Texas, when Ernest Reid caught a 1,302-lb. sawfish on Sept. 1. The sawfish is not considered as a game fish in the same class with the broadbill swordfish or the tuna, but this record is interesting in that it proves what huge fish can be taken on rod and reel.

In addition to these world's records, two important ladies' records were established in 1940. One of these was a 611-lb. broadbill swordfish caught by Mrs. John Manning at Tocopilla, Chile, on July 23. The other was a 792-lb. bluefin tuna caught by Mrs. L. G. Bloomingdale at Wedgeport, Nova Scotia, on Sept. 3.

As far as fresh-water fishermen are concerned, there was only one important record established during the 1940 season. This was a new world's record muskellunge caught by Percy Haver on June 28 in Lake St. Clair, Mich. The muskellunge weighed 62½ lb. and is the largest strictly fresh-water game fish ever caught in America. Although a muskellunge record of 58½ lb. stood unchallenged from 1932 through 1938, the weight of this fish has been exceeded five times in the past two seasons. (D. Ho.)

Anglo-Egyptian Sudan. A territory under the joint sovereignty of Great Britain and Egypt in northeastern Africa, south of Egypt. Area 967,500 sq. mi.; pop. (est. 1939) 5,858,317. Chief towns: (pop. 1938) Khartoum (46,676); Omdurman (110,959); Port Sudan (21,773); Atbara (19,757); El Obeid (27,390). Governor-general: Lt.-Gen.

Sir Hubert Huddleston; languages: English and Arabic; religion: Mohammedan.

History.—After the entry of Italy into the European war in June 1940, the Sudan took an active part in hostilities. Thousands of refugees from Abyssinia offered their services to the government, and on July 22 it was reported that Emperor Haile Selassie had arrived to organize these forces against the Italians. Fighting during 1940 was, however, confined to frontier skirmishes, notably around Gallabat in the Sudan and Metemma in Abyssinia, and to aerial warfare. In the course of a tour of the middle east, Anthony Eden in the autumn visited many parts of the Sudan, inspecting troops and defences, and on Oct. 27 he met General Smuts and General Wavell at Khartoum where the military situation in north Africa and the middle east was reviewed in a series of important conferences.

During 1940 the Emergency Supply committee was reconstituted as the Sudan Resources board to investigate and advise on the manner in which the resources of the Sudan might best be utilized for the benefit of the Sudan, Great Britain and Egypt, and necessary supplies and foreign markets assured.

Although the war brought certain economic problems to the Sudan, satisfaction was felt at the way these had been tackled by all members of the community. In most territories it was not worth while to plan comprehensive or costly programs of educational expansion, because funds could not be allocated in advance, but in the Sudan the fourth year of the approved ten-year plan was carried out without substantial modification. The medical services estimate stood at £300,000, a generous proportion of the total revenue. Adverse weather conditions, particularly the heavy rainfall of the autumn of 1939, caused a considerable decrease in the cotton crop of the Gezira. The usual problem of the disposal of the hold-over had practically disappeared, since nearly all the balances of former crops were disposed of, and despite shipping difficulties fair progress was made with the sales of the 1940 crop.

Education.—Intermediate schools 11, scholars 1,573; higher: secondary schools 465, post-secondary schools 73.

Banking and Finance.—In 1938: revenue £7,574,000; expenditure £7,293,000; public debt (Dec. 31, 1938) £13,873,800.

Trade and Communication.—In 1939 the value of exported merchandise amounted to £E5,367,396, of which cotton accounted for £E3,410,080 and gum £E711,606. Communication: roads, suitable for motor traffic, all weather, c. 1,000 mi.; railways 1,991 mi.; river service 2,325 mi.; motor vehicles licensed (1937) 4,354 cars, commercial vehicles and cycles; telephone subscribers (1938) 2,352.

Agriculture and Mineral Production.—Production: (in metric tons) cotton seed (1938-39) 105,000; ginned cotton (1938-39) 60,000; millet (1937-38) 315,000; sesamum (1937-38) 33,000; maize (1937-38) 10,000; wheat (1937-38) 8,000; groundnuts (1937-38) 8,500; gold (1938) 252 kilograms.

Anthropology, the comparative science of man, has been primarily interested, until recently, in the reconstruction of man's physical and cultural history. However, publications and researches of 1940 in most of the five major fields of anthropology evidenced new and significant trends of interest in other subjects as well. In the brief summary of the year

which follows, the additions to knowledge in the older subjects, as well as the more recent trends in physical anthropology, archaeology, linguistics, ethnology and social anthropology are reviewed.

Physical anthropology was in 1940 showing much interest in human growth studies, constitutional typing, physical inferiority and other problems of human biology. Using a modification of Kretschmer's threefold classification, Sheldon and Tucker were able to classify all human beings according to the proportionate amount of three components occurring in each individual (W. H. Sheldon, W. B. Tucker and S. S. Stevens, *Varieties of Human Physique*, 1940). After studying 17,000 American criminals, Earnest Hooton concluded: criminals are "biologically inferior"; different types of crimes are correlated with interrelated combinations of bodily traits; and when members of different races are criminal they are inclined to commit certain crimes and not others (E. A. Hooton, *Crime and the Man*, 1939). Hooton's revival of the Lombrosian hypothesis in a modern form is the subject of considerable controversy.

In the older field of human evolution and fossil man, the most important development in 1940 was the publication of the physical findings from the caves of Mt. Carmel in Palestine (T. D. McCown and Sir Arthur Keith, *The Stone Age of Mount Carmel II*, 1939). The skeletal material consists of 12 individuals from the Upper Paleolithic. The authors, from the osteological evidence, believe the area is a transitional zone between Neanderthal forms in the west and Proto-Cromagnon in the east. Investigations of recent skeletal material demonstrate that 4,000 years ago the present European physical types had already appeared (W. M. Krogman, "Racial Types from Tepe Hissar, Iran, from the Late Fifth to the Early Second Millennium, B.C.," *Proceedings of the Dutch Academy of Sciences*, vol. 39, no. 2, 1939). There were no new developments during the year on Sinanthropus and Pithecanthropus or on early man in the two Americas. Publications appeared in 1940 on the South African man-apes (W. K. Gregory and M. Hellman, "The Upper Dental Arch of Plesianthropus Transvaalensis Broom, and Its Relations to Other Parts of the Skull," *American Journal of Physical Anthropology*, vol. 26, pp. 211-28, March 1940, and R. A. Dart, "The Status of Australopithecus," *American Journal of Physical Anthropology*, vol. 26, pp. 167-86, March 1940).

Trends in archaeology are towards greater collaboration with the ethnologists and historians to interrelate recorded history and the testimony of the excavators. The increasing use of dendrochronology for greater accuracy in dating (Dr. Florence Hawley in the Mississippi valley and a large number of archaeologists in the southwest) is an example of the effective use of a borrowed technique in archaeology. In the United States, work continued with its usual intensity in the southwest (J. O. Brew, "Preliminary Report of the Peabody Museum Awatovi Expedition of 1937," *American Antiquity*, vol. 5, no. 2, 1939) and in the upper Mississippi valley. The relations of middle America to North and South America were receiving increasing attention (C. Hay, R. Linton, S. K. Lothrop, H. L. Shapiro and G. C. Valliant [eds.], *The Maya and Their Neighbors*, 1940). Two North American areas, until recently relatively quiescent, were in 1940 very active; in New England, under the leadership of Douglas Byers of Andover academy, a large number of excavations were made, and, in the southeast, stimulated by government financing and new interest in the state universities and museums, extensive excavations gave evidence of cultural sequences ranging from simple hunting and gathering people to highly developed towns. Further generalizations on archaeological results from the principal areas of North America ("Essays in Historical Anthropology in North America, Published in Honor of John R. Swanton," *Smithsonian Miscellaneous Collections*, vol. 100, 1940) and from the Andean

THE FIRST DEFINITIVE STUDY of the Negroids of Bougainville in the Solomon islands, heretofore anthropological mysteries, was announced in March 1940 by Dr. Douglas Oliver of the Peabody museum, Harvard. The photograph shows a marriage ceremony in midstream. Groom and bride squat with bridesmaid between them

region of South America appeared (W. C. Bennett's "Archaeology of the Northern Coast of Peru: An Account of Exploration and Excavation in Viru and Lambayeque Valleys," *Anthropological Papers*, no. 37, 1939).

Reports indicated that little or no archaeological or ethnological work was done in warring Europe; but English anthropologists were active in other parts of the empire, particularly in Africa. The Russians continued their activities within their own borders (H. Field and E. Prostov, "Archaeological Researches in the U.S.S.R., 1938-39," *American Anthropologist*, vol. 42, no. 2, part 1, pp. 211-35, April-June 1940).

There were no major developments in linguistics, but field workers were active, studying native languages in most of the major areas of the world, and there was an increasing tendency to investigate problems of meaning and communication and the relations of these two subjects to social behaviour.

The range of subject matter of ethnology and social anthropology was being constantly extended. At the one extreme, an increasing number of studies were made on modern society, and, at the other, the ideological and methodological groundwork was laid for research on the social life of the other primates (S. Zuckerman, *Social Life of Monkeys and Apes*). Evidence continued to accumulate indicating that the ape and monkey societies are only more extreme varieties of our own kind of social behaviour and function biologically and adaptively very much as ours does. Hart (C. W. M. Hart, "Social Evolution and Modern Anthropology," *Essays in Political Economy in Honor of E. J. Vrwrick*), among others, made the point that if social anthropology adds these simple organizations to one extreme of the range of social complexity and complex modern civilizations to the other, the problems of social evolution must once more be considered. Three or four decades of concerted attack on social evolution as a working hypothesis may fail and become significant only as a criticism of the unilateral theories of Morgan and similar writers.

During the year, anthropological knowledge of primitive social

institutions was considerably advanced; this was particularly true of political and economic organizations (J. J. Herskovits, *The Economic Life of Primitive Peoples*, 1940, and A. I. Richards, *Land, Labor, and Diet in Northern Rhodesia*, 1939). Other additions to comparative economics came from such diverse areas as New Guinea (H. I. Hogbin, "Native Land Tenure in New Guinea," *Oceania*, vol. 10, no. 2, pp. 113-65, Dec. 1939), western Asia (E. R. Leach, "Social and Economic Organisation of the Rowanduz Kurds," London School of Economics and Political Science, *Monographs on Social Anthropology*, no. 3, 1939), and Polynesia (R. Firth, *Primitive Polynesian Economy*, 1939). The comparative study of governmental institutions was benefited by the publication of a number of studies from Africa and North America (E. E. Evans-Pritchard, "The Political System of the Anuak of the Anglo-Egyptian Sudan," London School of Economics, *Monographs on Social Anthropology*, no. 4, 1940; *The Nuer: A Description of the Modes of Livelihood and Political Institutions of a Nilotic People*, 1940; M. Fortes and E. E. Evans-Pritchard [eds.], *African Political Systems*, 1940; G. T. Hunt, *Wars of the Iroquois*, 1940).

The relation of the social structure to sexual behaviour in the field of the family and kinship was given special attention (researches of Dr. George P. Murdock; I. Schapera, *Married Life in An African Tribe*, 1940; F. L. K. Hsu, "The Problem of Incest Tabu in a Northern China Village," *American Anthropologist*, vol. 42, no. 1, pp. 122-35, Jan.-March 1940). Further documentation of kinship structures was made (A. P. Elkin, "Kinship in Southern Australia," *Oceania*, vol. 10, no. 2, pp. 196-234, Dec. 1939).

The psychology of the individual in non-literate societies was dealt with in a number of studies (W. Dennis, *The Hopi Child*, 1940; M. Mead, "Social Change and Cultural Surrogates," *Journal of Educational Sociology*, vol. 14, no. 2, pp. 92-109, Oct. 1940). Acculturation problems received treatment in several studies on white and Indian contact in North America (R. Linton, *et al.*, *Acculturation in Seven American Indian Tribes*, 1940).

Works of general interest included theoretical analyses of the relation of the individual to society (B. Malinowski, "The Group and the Individual in Functional Analysis," *American Journal of Sociology*, vol. 44, no. 6, May 1939), and studies of ritual, myth and taboo (A. R. Radcliffe-Brown, *Taboo*, the Frazer Lecture, 1939; J. Weckler, *Ritual Status in Polynesia*, being published

by the U. of C. press; and R. Firth, *The Work of the Gods in Tikopia*, vols. 1 and 2, 1940). One of the chief contributions to method and to the relation of ethnology to geography was made by Kroeber (A. L. Kroeber, "Cultural and Natural Areas of Native North America," *University of California Publications in American Archaeology and Ethnology*, vol. 38, 1939).

The social anthropology of modern life, one of the newer developments, accumulated an extensive literature, world-wide in scope. Studies of the modern community in eastern Asia (J. F. Embree, *Suye Mura: A Japanese Village*, 1939; and H-T Fei, *Peasant Life in China: A Field Study of Country Life in the Yangtze Valley*, 1939) and in Europe (C. Arensberg, *Irish Countrymen*, 1937, and C. Arensberg and S. Kimball, *Family and Community in Ireland*, 1940). R. H. Lowie's two chapters on European cultures, in the new edition of *An Introduction to Cultural Anthropology*, 1940, were published. Under the leadership of Robert Redfield, a number of researches on modern folk and city societies were being conducted in Latin America (R. Redfield, *Folk Culture in Yucatan*, being published by the U. of C. press). Similar studies were made in Canada and Arizona (H. Miner, *St. Denis: A French-Canadian Parish*, 1939; and E. H. Spicer, *Pascua: A Yaqui Village in Arizona*, 1940).

The results of a number of researches on communities in the United States were published in 1940. Negro-white relations were examined in the southern United States (H. Powdermaker, *After Freedom*, 1939), and identified as a variant form of caste (A. Davis, B. B. Gardner, E. R. Gardner, *Deep South*, being published by the U. of C. press). Social researches were pursued on problems of rank, ethnic acculturation, social change, and symbolic behaviour in a New England community (W. L. Warner, P. S. Lunt, L. Srole, J. O. Low, *Yankee City*, being published by the Yale University press). Personality studies, by use of anthropological and psychological techniques (A. Davis and J. Dollard, *Children of Bondage*, 1940; and W. L. Warner, B. H. Junker, W. A. Adams, *Color and Human Nature*, being published by the American Council on Education) similar to those made in non-literate communities, were undertaken.

Antimony. World production of antimony was estimated at 34,000 metric tons in 1939, against 34,500 tons in 1938, a 20% drop from 1937. Continuing decreases in China and Mexico were only partially offset by increases in Bolivia and Yugoslavia. While China once supplied 70% of the demand, Mexico 10% and Bolivia 7%, in 1939 China furnished only 17%, Bolivia 30%, Mexico 23% and Yugoslavia 12%. Until recently, the United States output has been limited to a few hundred tons of by-product metal in antimonial lead, though a smelter has been in operation at Laredo, Tex. since 1931, using Mexican ores. In 1938 a small plant began operation at Los Angeles, using a Mexican ore containing both antimony and mercury, and early in 1940 production of by-product antimony was reported to have been started in Idaho from silver-copper ores. The United States is the largest consumer of antimony taking about half of the world supply of new metal to satisfy two-thirds of its consumption demand, the other third being furnished by secondary metal. A marked feature of the United States consumption is the increase in the demand for oxide, made largely from South American ores and a corresponding decrease in the demand for metal; the demand for oxide has about doubled since 1935. The Chinese industry has been badly disorganized, first by the depression and then by the Sino-Japanese war, exports in 1939 being only 29% of those in 1929 and 40% as compared with 1935. (G. A. Ro.)

Anti-Saloon League of America, Inc. The Anti-Saloon League of America is a nonpartisan, interdenominational organization formed in 1895 for the purpose of temperance education and legislation.

During 1940 the first state which had legalized liquor following repeal of national prohibition reversed its attitude. In an advisory referendum on Aug. 27, South Carolina voted on the question, "Do you favour discontinuing the legal sale of intoxicating liquors, wines, beers and other intoxicating beverages, and the imposition of new taxes to replace lost revenue as a result of the repeal of the present liquor law?" The people voted 189,361 for and 130,366 against repeal of the liquor law, a majority of 58,995 for repeal of the liquor law.

In Oklahoma, on Nov. 5, repeal of the state prohibition amendment was defeated by 374,911 against 290,752 for repeal, a majority of 84,159 on direct vote against repeal of state prohibition. Since a majority of all the votes cast was necessary, repeal of state prohibition failed by 133,134 votes. Returns show a slight increase in the number of no-licence units in elections held during 1940 under local option.

The biennial national convention of the league was held Nov. 24-26, 1940, in Calvary Baptist church, Washington, D.C., the birthplace of the national league. The national board of directors reaffirmed the general program which it had adopted at the biennial convention in Columbus, Ohio, in 1938. The national headquarters are located at 131 B st. S.E., Washington, D.C.

(E. B. Du.)

Anti-Semitism. The violent anti-Semitism which forms one of the fundamental points of the program and activities of national socialist Germany not only continued unabated during 1940, but as a result of the national socialist domination of most of continental Europe it spread to such an extent that it became a problem of unprecedented dimensions. The national socialist government had to adapt its policies accordingly. While in the first five years of the regime emigration of German Jews to outside countries was encouraged, as a means of solving the German-Jewish problem created by the national socialist legislation, the early conquests of Austria, Czechoslovakia and Poland had the paradoxical result of bringing many more Jews

PARIS, long the capital of political and racial refugees, gradually adopted anti-Semitism in 1940 under German domination. The picture shows a "Jews forbidden" sign in a restaurant on the Champs-Élysées

under national socialist domination than there had ever been in Germany. In 1939 the national socialists proposed the creation of a Jewish "reservation" in southeastern Poland, where all the millions of Jews then under national socialist domination were to be concentrated. Although at the end of 1939 a beginning had been made with the transfer of Jews to this reservation and thousands were left there stranded, exposed to certain starvation and inhuman treatment, the plan was abandoned in 1940 as impracticable. With the widening of national socialist control over most of continental Europe, the national socialists envisaged a "solution" of the problem as they understood it by shipping the millions of European Jews to Madagascar, where they would live under strict supervision of the national socialist gestapo.

National socialist anti-Semitism does not aim only at the extinction of what the national socialists regard as an inferior race; it serves, above all, as a most important means in the effort to undermine democracy and the will to resistance by propaganda in those countries which national socialist Germany wishes to bring under its influence or control. One of the favourite weapons of national socialist strategy was the use of the slogan that the wars in Europe and even in Asia were not due to fascist aggression but to "Jewish warmongers" who drove the nations against their will to resist the peaceful and beneficial intentions of the fascist nations. The Jewish refugee problem, created by national socialism, served also the purpose (from the German point of view) of arousing attention everywhere to the existence of a "Jewish problem," and thus to intensify it, to increase generally the mental confusion and to aggravate and exploit economic antagonisms. The agitation against "Jewish bolshevism," the identification of Judaism with communism or Marxism, came to an end in Aug. 1939, with the conclusion of the treaty of friendship between national socialist Germany and the soviet union, although isolated anti-Semitic groups, especially in the United States, continued to make use of the slogan discarded (at least for the time being) by national socialist Germany, and in 1940 even by fascist Italy. The identification of Jews with communists was replaced in national socialist propaganda by that of Jews and capitalists. National socialism was now proclaimed as a revolution against Jewish capitalism, represented by the democracies or by any other country which seemed to stand in the way of national socialist aspirations towards world control.

While the Jews in Germany were entirely separated, economically, culturally, socially and politically, from the life of the German people, and while the Jews in Poland were subjected to even

worse treatment, and forced in Warsaw and other cities to live within ghetto walls, the measures taken against the Jews under national socialist influence in other European countries met with the tacit resistance and sometimes with demonstrative acts of disapproval on the part of the non-Jewish population. The treatment meted out to the Poles by their national socialist conquerors had clearly shown that the anti-Jewish legislation served only as an entering wedge for a similar treatment of other non-Germanic races, once they were put into a helpless position like that of the Jews.

While there was no important new anti-Semitic legislation in Germany and Italy during 1940, the dispossession of Jews from all economic positions proceeded rapidly there as well as in Slovakia and Hungary, countries directly under the control of Germany and Italy. The political events in Rumania, which in a similar way destroyed the independence of the country and put it completely under national socialist control, had ruinous effects on the already precarious position of the Jewish communities in that country. In the Low Countries and in Norway the attempts at the *Gleichschaltung* of their economic and intellectual life resulted necessarily in a great increase of anti-Semitic propaganda, officially sponsored, and in restrictive anti-Semitic measures. Bulgaria and Yugoslavia, which had never before known any official anti-Semitism, adopted in the fall of 1940 the first legislative curbs upon the activities and political rights of their Jewish citizens. The Bulgarian legislation went especially far, while Yugoslavia up to 1940 has limited anti-Semitism to the introduction of a *numerus clausus* in universities and secondary schools. Of special importance was the introduction of the first racial legislation in France, where the government of Marshal Pétain on Oct. 18 excluded Jews from all higher offices of state, from the civil service, from the army and from all teaching positions. Although the free professions still remained open to Jews, regulations were promised to fix a determined proportion for them. All Jews were strictly excluded from any position in journalism, in the film business, in the theatre and in radio. On Oct. 8 the law of Oct. 24, 1870 was repealed, which had accorded to the Jews in Algeria full French civil rights. In the occupied area of France the Jews were subject to restrictions like those in Germany, while from Alsace-Lorraine, part of which was annexed by Germany, all Jews and all traces of former Jewish life were eliminated.

In the remaining democratic countries the danger to democracy, implied in fascist aggression and propaganda, has aroused a strong will of resistance and a new emphasis on the values of democracy and its faith in individual rights and in the equality of all citizens. The necessity of stressing national unity and of combatting all disintegrating influences was seen clearly from the lessons of the fall of France and other European democracies. Although anti-Semitic propaganda in the United States, and also in Great Britain, by no means ceased and sometimes combined with the propaganda for a policy of appeasement and of yielding to fascist claims, nevertheless the general temper of the public and the increased attention paid to "fifth-column" activities counteracted to a certain degree the growth of anti-Semitism in the democratic countries. (See also FASCISM; JEWS, DISTRIBUTION OF; JEWISH RELIGIOUS LIFE; REFUGEES.)

Anti-Trust Law: see LAW (CASE).

Antonescu, Ion (1882—), Rumanian soldier and statesman, was born in Transylvania June 2 and fought with the Rumanian armies during the World War of 1914—

18, after which he was promoted to the rank of colonel. He later became military attaché of Rumania in London and Rome, chief of the army's general staff and war minister. In 1938 he took part in an attempted coup d'état against Carol's regime. In July 1940 he was imprisoned for opposing too vehemently the cession of Bessarabia and northern Bukovina to the U.S.S.R.

Released from prison Sept. 2, 1940, Antonescu was named prime minister by King Carol three days later, in the midst of the disorders that followed the partition of Rumania. Antonescu's first act was to demand the abdication of Carol (Sept. 6). The prime minister then assumed dictatorial powers and on Sept. 14 formally promulgated a totalitarian rule. In collaboration with Horia Sima, leader of the Iron Guards, Antonescu proceeded to restore temporary quiet in his country and established working relationships with the axis by signing the German-dictated pact of Nov. 23. His attempts to pacify Rumania were rudely broken by the mass executions of former officials under Carol on Nov. 27 and the following days. Antonescu's government disavowed responsibility for these murders and his authority apparently was about to collapse. But thereafter he gained power steadily and successfully suppressed an incipient civil war (see RUMANIA). By Dec. 6, when he issued a decree ordering the penalty of death for military insubordination, he apparently had regained power.

Appeasement Policy: see COMMUNISM; FRANCE; ITALY; GREAT BRITAIN.

Apples. The commercial apple crop in the U.S. in 1940 was estimated Nov. 1 by the department of agriculture as 115,456,000bu. The 1939 crop was 143,085,000bu.; the five-year (1934-38) average, 121,755,000bu. The commercial crop includes both apples sold for processing and for fresh consumption. Production in the western states increased, being 43,562,000bu. in 1940 compared to 41,940,000bu. in 1939, while in the eastern apple-growing states it was 51,757,000bu. in 1940 and 69,506,000bu. in 1939.

The Canadian apple crop was much smaller in 1940 in all the provinces, except British Columbia, than in 1939. The total crop in 1940 was 3,857,000bbl. compared to 5,792,000bbl. in 1939, a barrel being equivalent to three bushels or boxes. Despite the short crop the Canadian government adopted relief measures for growers, owing to the closing of export markets to the United Kingdom and other European countries. The government offered to apply a maximum of \$1,662,500 to the purchase of apples, principally in British Columbia where a normal crop resulted in an unmarketable surplus.

Aquariums.

In a war-torn world, difficulties of public institutions such as public aquaria become manifold. Even information as to the fate of such establishments near the centre of bellicose activities becomes difficult to obtain. It is known, however, that Regent's park aquarium in London was closed before the beginning of hostilities. The Berlin aquarium was apparently still in operation in 1940. American aquaria, although not completely cut off from the supply of eastern specimens, experienced difficulty in obtaining such material. These difficulties, involving shipping and the free movements of collectors, were increasing in 1940 and will surely result in the gradual reduction of exhibits from distant points. It has been reported that a number of private collections have already been impounded in various out-of-the-way places. No new aquaria announced openings during the year.

(C. M. BR.)

Aqueducts.

The All-American canal, the largest irrigation ditch in the United States, built by the bureau of reclamation at an estimated cost of \$38,500,000 was ready for service in Sept. 1940. It will carry water diverted from the Colorado river by Imperial dam for a distance of 80 mi. into Imperial valley, and with its 130-mi. Coachella Branch canal, water will be supplied for 1,000,000 ac. of land in southern California. The Colorado river aqueduct, completed by the Metropolitan Water district of southern California in 1939 at a cost of approximately \$200,000,000, extends 242 mi. from Parker dam on the Colorado river to Cajalco reservoir, 12 mi. south of Riverside, Calif. This aqueduct will deliver 1,000,000,000 gal. of water per day to Los Angeles and 12 neighbouring coastal cities. With the last of the tunnels on the distribution system under construction in Hollywood hills, the entire system, totalling 392 mi., including 108 mi. of tunnels, was nearing completion. The Delaware river aqueduct, an 85-mi. pressure tunnel, being built in 1940 by the board of water supply of New York, is an important feature of the \$298,000,000 Delaware project which will add 500,000,000 gal. to New York city's water supply, thus increasing the supply 50%. Scheduled for completion in 1945, the aqueduct, which is being driven from 25 shafts, will carry water 300 to 1,000 ft. underground from the watersheds of the Catskill mountains to Hillview reservoir, located on the northern boundary of New York city. More than half the aqueduct has been excavated and concrete lining operations have begun. Eighteen miles of the new pressure aqueduct of the Boston Metropolitan District Water Supply commission, extending from Southboro to Weston, were opened in Oct. 1940 to safeguard and improve Boston's water supply. A 7-mi. pressure tunnel is nearing completion to give Baltimore a long-needed supplementary conduit to its source of supply. A 30-mi. aqueduct, consisting of a 46-in. steel and concrete pipe line, was being undertaken by Grand Rapids, Mich., as a part of its \$4,100,000 Lake Michigan water supply project to bring water to the city from Lake Michigan. On the Central Valley project in California an initial 20-mi. section of the 46-mi. Contra Costa canal was completed to deliver water to the city of Pittsburg, Calif., for domestic use in Aug. 1940, and work was begun on an 8½-mi. section of the 40-mi. Madera canal to carry water from Friant dam to irrigate lands near Madera, Calif. Under construction were two tunnels of a 40-mi. aqueduct which will carry stored water from Deer Creek reservoir in Provo canyon over mountain slopes to Salt Lake City, Utah. (See also DAMS.)

(J. C. PA.)

Arabia. Total area (est.) 1,000,000 sq. mi. Total pop. (est., 1937) 9,300,000; Saudi Arabia, 4,500,000; Yemen 3,500,000; Oman and Muscat 500,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Ibn Sa'ud; Yemen, Imam Yahaya Muhammad Hamid ed Din; Oman and Muscat, Sultan Sayyid Said bin Taimur; Kuwait, Sheikh Ahmed Ibn Jabir al Subah.

History.—With admirable self-control, Arabia continued during 1940 to steer clear of the war. It is true that the sympathies of nearly all Arabs were with Britain and those fighting on her side, but to the policy of neutrality laid down at the beginning of hostilities the states of Saudi Arabia and of the Yemen officially remained faithful. Around the coasts, on the other hand, in the Aden protectorate, in Muscat and Oman, along the Trucial coast and in Bahrein and Kuwait the various potentates showed the most lively concern for the welfare of British arms and did what they could to assist their great ally.

To outward appearances the war made little difference to Arabia. Inevitably, hostilities affected the numbers of pilgrims journeying to Mecca and Medina—this "tourist traffic" was called, before the discovery of oil in Hasa, Arabia's "only crop"—but otherwise life went on with the same bare margin of existence as has characterized the peninsula for centuries. Exploitation and exploration for oil in eastern Saudi Arabia continued, as did the search for gold in the western side of that state.

For some months, both Berlin and Rome tried to persuade the world that Ibn Sa'ud was but waiting the moment to pounce upon and attack Aqaba, at the head of the Red sea, and to march on Trans-Jordan and Palestine. He was said to be maintaining, for this purpose, a great army just inside the Hejaz and near where his own land, Trans-Jordan and Palestine meet. This tale was but a canard. Ibn Sa'ud's relations with Great Britain remained excellent and the best known Arab king of modern times refused to allow within his vast domain any intrigues against his oldest friends, the British.

Another story which the axis spread around the world was that the British were bombing the Hadhramis—those Arabs in the eastern section of the Aden protectorate who can claim to be the originators of the "sky-scrapers." In this yarn again there was not a word of truth, but it gained such currency that the sultan of Mukalla himself who, as he said, knows every corner of the Hadhramaut and would surely have heard of bombing had there been any, in October issued to the world a categorical denial.

In Oct. 1940, during the fasting month of Ramadhan, the Italians bombed American oil properties both in Saudi Arabia and in Bahrein, on the baseless assumption, presumably, that these oil fields were virtually British. These raids caused tremendous indignation throughout Arabia, which at the end of the year was anxiously awaiting further disclosures of axis intentions toward Islamic lands.

Archaeology.

Western Hemisphere.—During the year 1940 two outstanding publications (see *Bibliography*) have summarized the archaeological cultures and synthesized the problems in North, Central and South America. Both embody the most recent archaeological conclusions and indicate the relationship of the four anthropological disciplines in solving the problems of aboriginal man in the new world.

Archaeological problems in the western hemisphere may be divided into two broad categories:

1. The antiquity of man and native culture in America. Association of man-made objects with now-extinct animals represents the

earliest horizon. Even though these extinct mammalian forms are regarded as belonging to the Pleistocene period, a considerable difference of opinion exists as to how many years ago man, responsible for the making of the Folsom points—and perhaps also responsible for the extinction of some of the Pleistocene fauna—roamed the western plains of the United States. The most conservative estimate would be from 8,000 to 10,000 years ago.

2. The time limitation imposed on the more sedentary and consecutive archaeological manifestations. Correlated ceramic sequences in the United States, Mexico, Central and South America, would seem to indicate that all of these cultural developments have taken place since the beginning of the Christian era.

Throughout 1940 archaeological excavations were made in practically every state within the union and Alaska. Work in Canada was discontinued because of the war in Europe. Excavations sponsored by the Smithsonian institution were continued at the famous Lindenmeier site in northern Colorado, where stratified deposits revealed two distinct cultural levels subsequent to the association of Folsom projectile points and extinct Pleistocene mammals. Sandia cave, near Albuquerque, N.M., contained two distinct strata of extinct animal bones and man-made flint points. The University of Michigan continued field researches on post-glacial beaches along the Great Lakes. The above sites have contributed the most authentic evidence of early man in the new world.

At a site roomi. north of the Arctic circle, on a gravel spit in the Arctic ocean, an expedition sponsored by the American Museum of Natural History and the University of Alaska uncovered the remains of a prehistoric town of 625 square houses arranged in five main avenues. The excavations revealed a culture dependent on the hunting of walrus, seals, caribou and sea birds. Laboratory analysis of the material culture may reveal an early group of people unrelated to the modern Eskimo. Through a small grant from the Smithsonian institution several desiccated bodies were recovered from Pennock and Dall islands in southeastern Alaska.

The Washington State museum and the University of Washington continued an archaeological survey along the Columbia river basin. The University of Oregon completed important excavations in southeastern Oregon. Several archaeological sites were excavated in California by the University of California, the Southwest museum and the Los Angeles museum.

In the southwest a few of the archaeological programs were resumed on proto-historic sites in the Papago country by the University of Arizona and the Museum of Northern Arizona; the University of New Mexico on small house ruins in Chaco canyon, N.M.; the University of Utah museum continued excavation of cave sites; and the University of Colorado museum on important cave sites in Yampa canyon in northwestern Colorado.

The University of Texas carried forward WPA excavations in north-central Texas. Several sites in Oklahoma were dug under the sponsorship of the state university. An important survey was made in the counties adjoining the Mississippi river in Arkansas. The U.S. National museum resumed its archaeological program in Kansas. Other excavations, assisted by WPA funds, were made in Nebraska, Missouri, Iowa and Minnesota.

The University of Chicago and the Illinois State museum directed explorations in several important sites in Illinois. The Indiana Historical society concentrated its archaeological efforts upon the excavation of the important Angel mounds and village site in southwestern Indiana. The Ohio State museum sponsored a re-examination of the well known Ft. Ancient state park area in southern Ohio.

Several sites were excavated in Kentucky under the direction

of the University of Kentucky and with assistance from WPA funds. Three important sites in Louisiana contributed additional data concerning the Marksville complex, which is distantly related to a highly developed prehistoric manifestation in Ohio and other northern Mississippi valley states, known as the Hopewellian phase.

The national park service sponsored an archaeological reconnaissance along the proposed Natchez Trace parkway in Mississippi. A large palisaded village was recovered around the Lamar site within the Ocmulgee national monument in central Georgia. Numerous sites were excavated in Alabama, Tennessee, Georgia, and North Carolina, as a result of continued federal sponsorship within the WPA.

Yale Peabody museum excavated a shell heap in Black Hill, Old Lyme, Conn. Vassar college inaugurated a five-year archaeological survey of the Hudson valley as one of the activities in the newly established division of anthropology. The Rochester Museum of Arts and Sciences continued its archaeological program in western New York by an excavation of an intensively occupied village site on Frontenac island in Cayuga lake. Numerous specimens recovered indicate another component of the Laurentian period. Two large ossuaries were excavated in Virginia by the U.S. National museum.

The second season's work of an expedition jointly sponsored by the Smithsonian institution-National Geographic society to Veracruz, Mexico, revealed additional examples of well carved colossal stone heads, carved altars, dated stelae, several caches of pottery figurines and painted pottery vessels. One of the stelae from Cerro de Mesa contains an early initial series date in the Maya calendar. This little known area in east central Mexico had produced an unusual amount of very important material. Near the close of 1940 the Smithsonian institution sponsored the exploration of prehistoric caves in Coahuila, northern Mexico, to determine their relationship with the cave-dwellers of the Big Bend area in southwestern Texas. The Departamento de Monumentos of the Mexican government and other institutions continued archaeological investigations, repairs and restorations in several of the well known sites, such as Monte Alban, Chichen-Itza, Cholula and Uxmal, Mexico.

The Carnegie institution of Washington, which continued archaeological investigations, locating new sites, directing reconstruction and repair contributed much to prehistory in Yucatan, northern Honduras and Guatemala. An archaeological survey sponsored by the American Philosophical society carried forward explorations of the Alta Verapaz in Guatemala.

In the Coclé province of Panama an expedition from the University of Pennsylvania excavated 30 graves and caches containing multiple burials and hundreds of pottery vessels, semi-precious stones, a large quantity of gold ornaments of exquisite workmanship, indicating the vast amount of non-perishable objects placed with the bodies at the time of burial.

In South America very few archaeological expeditions were inaugurated, although surveys were made looking toward the selection of sites for future excavations. Some of the institutions in Peru, Bolivia and Argentina continued work in their respective states.

The usual annual meetings of the American Anthropological association and the Society for American Archeology produced summaries of archaeological investigations. In addition, numerous archaeological conferences were held throughout the United States and Mexico. In May 1940 the Eighth American Scientific congress was held in Washington, D.C., at which time numerous archaeological papers were read by the delegates from the Pan-American countries.

BIBLIOGRAPHY.—Besides the many technical reports published during the

year (vol. 42, *American Anthropologist* and vol. 6, *American Antiquity*), the two outstanding publications for 1940 are: *Essays in Historical Anthropology of North America*, published in honour of Dr. John R. Swanton by the Smithsonian Institution as vol. 100 in the Smithsonian Miscellaneous Collections; and *The Maya and Their Neighbors*, dedicated to Prof. Alfred M. Tozzer. Both books contain a series of articles by 14 and 34 authors respectively. (F. M. SE.)

Eastern Hemisphere.—Although the war virtually stopped archaeological activity in central and western Europe, as well as Africa, with the exception of Egypt, many important discoveries were made during 1940. In the following summary the earlier periods are treated as a whole; for the Neolithic and later periods the evidence is presented on a regional basis. A bibliography for those desiring further information is given at the conclusion of this article.

The Palaeolithic Period.—In the vicinity of Montignac, in the Dordogne region of south-central France, a cave—the Grotte de Lascaux—containing Altamira-like paintings of the Upper Palaeolithic period was discovered, according to information received from Professor H. Breuil. Polychrome-painted hunting scenes are depicted, including bison, horses, reindeer and rhinoceroses. The place was found by a 12-year-old boy, who had to crawl through an opening one foot in diameter to gain access to the chambers containing the paintings.

A dispatch from Rome announced the finding of an Upper Palaeolithic female figurine, or "Venus," at Chiozza, near Reggio Emilia. It is stated that the statuette is about eight inches long and made of limestone; the arms, feet and head had been broken off.

An expedition from the Marr Institute of Languages, History and Material Culture, Leningrad, excavated at Samkura cave, near Dzherulsk, in western Georgia, U.S.S.R., and found stone implements—knives, scrapers, points, etc.—of the Palaeolithic period, associated with bones of an extinct cave bear.

Fossil Man.—Rev. Joseph Doherty, S.J., of Boston College, who has been conducting excavations at the important Palaeolithic cave of Ksâr 'Akil, six miles north of Beirut in Syria, announced the discovery of the fossilized bones of a child 7 or 8 years old, found below 34 feet of Upper Pleistocene deposits. On the basis of the very meagre data available, it appeared that this individual represents more or less the same type known in Palestine at the Wadi Mugharet caves, near Haifa, and the cave of Jebel Kafseh, near Nazareth. In certain respects this type is fundamentally modern, but more primitive "neanderthaloid" features are also apparent.

Neolithic and Later: The Near East.—In northeastern Syria the Theodore Marriner Memorial expedition, under the joint auspices of the Museum of Fine Arts, Boston, and the Oriental Institute of the University of Chicago, Dr. C. W. McEwan, field director, excavated at Tell Fakhariyah, near Ras el-'Ain, in the spring and summer of 1940. The objective was a Mitannian administrative city of c. 1500 B.C. Brief reports from the field indicated the discovery of a palace with a treasure of ivories, statuettes and other objects of art.

Some of the most significant finds at Ras Shamra, the ancient city of Ugarit, were reported by Professor Claude Schaeffer, director of the French Archaeological expedition to Syria. In the vaults of one of the houses in the 11th level (19th to 17th centuries B.C.), Aegean-type pottery, probably Cretan, as well as stone and alabaster vases of Egyptian origin were found, attesting widespread international commerce at an early period in the eastern Mediterranean. Probably to be attributed to the Hurrians are two gilded copper cult statuettes of the early second millennium B.C., which reveal an art hitherto totally unknown in north Syria. Of Mitannian origin is an ornamented battle-axe of the 15th to 14th centuries B.C. According to Professor Schaeffer, the metal of the blade "has been tempered and hardened, thus revealing the

THE ARCHAEOLOGICAL "FIND" of 1940 was the tomb of Pharaoh Psusennes, discovered in February by Prof. Pierre Montet on the site of ancient Tanis, Egypt. Montet is shown examining the silver sarcophagus after its lid had been removed

beginnings of steel-making." The blade has been joined to the elaborately decorated head of the axe by shrinking, a feature requiring a high technical skill and obviating the use of rivets.

The results of the 1940 excavations at Tell el-Kheleifeh, the ancient city of Ezion-Geber, on the Gulf of Aqabah, confirmed Professor Nelson Glueck's previous reports that the centre of this important site was the smelter-refinery. Digging, under the auspices of the American School of Oriental Research in Jerusalem and the Smithsonian Institution in Washington, uncovered extensive smelters and foundries, as well as fortifications, of the 10th and 9th centuries B.C.—the most important phase being contemporary with the reign of Solomon.

Egypt.—At the necropolis of Sakkara, burial ground of Memphis, the ancient capital of United Egypt, Zaki Y. Sa'ad of the Egyptian department of antiquities discovered three important Old Kingdom mastaba tombs. One of these produced a beautifully inscribed false wooden door; the second bore the name and titles of Queen Nebet, wife of King Unas, the last king of Dynasty V (c. 2860–2830 B.C.); while the third contained the remains of the "Vizier" Mehou, grandson of Unas.

The tomb reliefs show that this man was a rich landowner, and among them an entirely new subject—the tortoise—appears for the first time in Old Kingdom art. The composition of this unique scene includes birds and fishes peering at the tortoise, which seems to be standing on its head.

Early in 1940 the find of the year and the most significant archaeological discovery in the Egyptian field since Tutankhamon's tomb, opened in 1922, was made at Tanis, ancient capital of the Tanite kingdom of Lower Egypt, by Professor Pierre Montet of Strasbourg university. This consisted of the intact tomb of Pharaoh Psusennes of Dynasty XXI (c. 1054–1009 B.C.), who reigned some 200 years after Tutankhamon, and who is believed to have been the father-in-law of Solomon. The carved sarcophagus of black granite contained a mummy case of solid silver—unquestionably one of the most beautiful objects discovered anywhere in recent years. In addition to elaborate decoration, the silver effigy bears the royal insignia, while alongside it four canopic jars were found. Within was a silver-gilt body covering and a gold mask, together with a mass of fine jewellery, many solid gold jars and vases, as well as the arms of Egyptian soldiery at the time of Solomon.

Cyprus.—At Khirokitia, near milestone 30 on the Nicosia-Limassol road, Dr. P. Dikaios, curator of the Cyprus museum, discovered a brilliant Neolithic culture with an early non-pottery

UNDISTURBED early Chinese tomb dating from the Han period (the two centuries before and after Christ), found on the Lach-truong plain in Thanh-hoa province, Northern Annam, Indo-China. The tombs of this period have vaulted roofs of massive brickwork and contain elaborate funerary furniture

stage, which is dated by the excavator at about 4000–3500 B.C. In one of the houses a large number of infantile skeletons were unearthed, in direct association with the clay head of a Chthonic (earth) deity and adult burials. Dr. Dikaiois regards this as evidence of infant sacrifice connected with the death of adult people buried in the house and with the worship of the Chthonic deity.

Miss J. du P. Taylor, assistant curator of the Cyprus museum, excavated a Bronze Age miners' village at Apliki, near Lefka, in central Cyprus. Although from early times Cyprus supplied the Mediterranean with copper, as attested by the fact that the island derives its Greek name Kupros from the metal copper, it has hitherto been impossible to distinguish the later Roman workings from those of the earlier period.

The contents of a Cypriote tomb found at Lapithos, on the north coast of Cyprus, were published by Miss V. R. Grace of the American School of Classical Studies at Athens. In addition to material of the Early Bronze Age in Cyprus (Gjerstad's Early Cypriote III Period), this tomb produced a Minoan vase, "the earliest recorded import into Cyprus and certainly the earliest known instance of Cretan ware in the Levant." This find, which is referable to Middle Minoan Ia in Crete, indicates that the Early Bronze Age in Cyprus did not begin before the Middle Bronze Age in Crete: c. 1900 B.C. in terms of Minoan chronology.

Crete.—On a ridge about two miles along the ancient road linking Knossos and its port Amnisos, R. W. Hutchinson, curator of Knossos, excavated a Late Minoan I *tholos*-tomb of c. 1580–1550 B.C. for the British school at Athens. On the south jamb of the doorway into the burial chamber, which contained three pit-graves, a Minoan inscription consisting of a double axe and trident sign was found. According to Mr. Hutchinson, this newly-discovered *tholos* is significant in that it suggests a link between the circular tombs of the Massara plain in central Crete and the famous "beehive" tombs on the Greek mainland, erected some two centuries later, after the fall of Knossos.

Italy.—The field of Etruscan archaeology received an important contribution during 1940 from the authoritative pen of Dr. G. M. A. Hanfmann of Harvard university. This comprehensive treatise, "The Etruscans and Their Art" (*Bull. Rhode Island Museum of Art*, xxviii [1940] 1–35), covers the entire development of Etruscan art and culture from its beginnings (850 B.C.?) down to 80 B.C., when Etruscan independence was virtually surrendered to Rome.

The excavations at Ostia, directed by Guido Calza, continued to yield significant results. Many interesting sculptures, as well as an important early Christian basilica, were unearthed during 1940 at the site of this extensive commercial and administrative Roman city.

At Herculaneum, Amadeo Maiuri discovered a small Christian chapel in an upper-story room of one of the houses of that city. This evidence raises anew the question of the actual presence of Christians in the buried cities of Campania.

In clearing a new area on the southwest fringe of the city of Pompeii, Commendatore Maiuri found a most striking marble portrait head, identified as Marcellus, the nephew of Augustus.

U.S.S.R.—Excavations under the direction of G. Gurina of the Marr Institute of Languages, History and Material Culture, Leningrad, in the district of Povenets on Lake Onega (Karelian—Finnish S.S.R.), revealed a rich Bronze Age site on the Orov-Navolok peninsula. In addition to a bronze foundry, many bronze articles and some interesting pottery were found.

On the right bank of the Don river, five miles below the Cossack settlement at Tsymljanskaja, I. I. Liapushkin, leader of the Sarkel expedition of the Institute for the History of Material Culture, excavated a highly fortified *gorodishche* of the 8th to 10th centuries A.D. The three building levels yielded a sequence of pottery vessels, iron objects and personal ornaments showing connections between this site and the steppes on the one hand, and the Black sea littoral, the cities of the sea of Azov and the Caspian sea on the other.

In central Asia, A. N. Bernstam investigated a series of tumuli at Kenkol near the headwaters of the Talus river, Kirghiz S.S.R. Below seven of these burial mounds, which belong to the 1st century A.D., catacombs were discovered, cut out of the loess and containing burials associated with grave furniture, in some cases similar to modern Kirghiz objects. In the southern part of the Farghana valley, Uzbek S.S.R., an expedition led by M. E. Masson engaged in an important reconnaissance project. A series of interesting archaeological finds was made in this area during the construction of a large irrigation canal.

Iran.—The third season's work of the Iranian expedition of the Metropolitan Museum of Art at Nishapur, in northeastern Iran, produced the first early Islamic paintings ever found in this region. These consist of both polychrome and black-and-white wall paintings, showing figural and ornamental subjects; they date from the latter part of the 8th and the early 9th centuries of our era. Following the downfall of the Sassanian empire, Nishapur was an important trade centre, as suggested by finds of imported celadon and stoneware of the T'ang dynasty (617–906 A.D.) from China, as well as by fragments of polychrome lustre-ware of Samara type from the Tigris valley to the west. The site also yielded many interesting bronzes and ceramics of the Islamic period.

Excavations by R. Ghirshman, director of the archaeological expedition of the Louvre museum, were conducted at Shapur, a city at the entrance of a gorge on the edge of the Iranian plateau. This was the site of a royal residence built by Shapur I, second king of the Sassanian dynasty (225–636 A.D.). Monumental bas-reliefs, the king's palace with mosaic panels, a Zoroastrian temple, and elaborate statuary were among the discoveries. The city, laid out on Hellenistic pattern, is important in that it gives information concerning the beginnings of Sassanian art and culture in the middle of the 3rd century A.D.

Afghanistan.—The site of Begram, 45 miles north of Kabul, was dugged by M. Joseph Hackin, leader of the French Archaeological mission to Afghanistan. Begram was the capital of ancient Kapisi and belongs to the Hellenic period (1st to 2nd centuries A.D.) of this region. The elaborate Hellenistic plaques, Graeco-Roman bronzes and coins, Indian ivories, Chinese lacquer (Han period), and utensils of domestic use, suggest that one of the fundamental sources of inspiration of Graeco-Buddhist art came from Afghanistan.

India.—Some three and a half miles east of Bhera in the Jhelum valley, Punjab province, C. L. Fabri discovered a stratified site of the times of the Great Moguls, at a place called Divanpura. One of the mounds, known as Surkhanvali Ahli, yielded over 1,800 objects, which range in age from the 15th century to 1750 A.D. Thus for the first time the story of the daily life in a provincial Mogul city has been revealed in all its details.

Indo-China.—Since 1934 Professor Olov Janse has been conducting important archaeological researches in Indo-China, the chief aim of which has been to study the southern sphere of Chinese civilization from the Han period to the beginning of the Ming dynasty. The expedition, originally on behalf of the Paris museums (Guimet and Cernuschi) and the French school of the far east, has been under the auspices of the Harvard-Yenching institute since Nov. 1938. As the actual field-work was not terminated until June 1940, it seems appropriate to summarize here for the first time some of the main results of Professor Janse's excavations.

At Dong-Son in Thanh-hoa, northern Annam, a site extending for several miles along the right bank of the Song-Ma river, an interesting native culture was discovered. This was autochthonous in its early stages, and evidence for the use of pile-dwellings was found. But as a result of contact with southward spreading Chinese civilization, first appearing in this area during Han times, the upper levels contain many exotic objects and the local material becomes greatly modified. In addition to large amounts of pottery, various ornaments, drums, vases and basins of bronze, iron weapons, as well as jade rings and beads of rock crystal and gold, attest the really high development of the Dong-Son culture. In the nearby tombs the evolution of Dongsonian craftsmanship from the beginning of Han (202 B.C.) to the time of the T'ang dynasty (617–906 A.D.) can be traced. Some of these tombs were very rich, but with the exception of the funerary furniture nothing remained to indicate the position of the

burials. Investigations at the necropolis of Sa-huynh, Annam, revealed a culture in some respects similar to Dong-Son and probably to be assigned to the beginning of our era.

Professor Janse also excavated about 100 Chinese tombs in Tonkin and northern Annam, establishing the evolution of Chinese tomb-construction from the 2nd century B.C. down to the 13th century A.D. The oldest and most elaborate vaults with up to three chambers belong to Han times; the later ones become gradually smaller until during the T'ang period they are generally no longer vaulted. With the beginning of the Sung dynasty (906-1273 A.D.) the custom of making brick tombs went out of use, and the coffins were placed directly in the ground. Magnificent funerary furniture was discovered at these sites, especially at those of the Han period. In the actual construction of the vault, glazed polychrome bricks were sometimes used, while in other cases the bricks were decorated in linear relief depicting dancing scenes, geometrical motifs, etc. This latter type may or may not be glazed. Large quantities of ceramics, small-scale reproductions of peasant's houses, glazed earthenware vessels, as well as many fine bronzes, including a lampstand in human form and believed to represent the solar tree symbol, were found in the tombs. One of the most interesting characteristics of the southern sphere of Chinese civilization is the fact that in certain respects it had connections with the west.

Of no less significance than his discoveries at Dong-Son and in the Chinese tombs of Tonkin and Annam is a series of Chinese pottery kilns, found by Professor Janse at Tam-tho, in the Thanh-hoa province, northern Annam. On the basis of the study of literally tons of pottery associated with some 12 elliptical kilns, many of which go back to the early Han (202 B.C.—9 A.D.), important data bearing on the method of manufacture have been secured. Furthermore, it has been demonstrated that the wares made at Tam-tho were not only purveyed to the Chinese population but to the indigenous people as well, since identical examples were found at Dong-Son.

China.—Professor W. Perceval Yetts's book, *The Cull Chinese Bronzes*, which was published, will be welcomed by collectors and archaeologists alike. Almost every type of Chinese bronze object, beginning with material excavated at An-yang, the site of a Shang-Yin capital of the second millennium B.C., through Han times (202 B.C.—220 A.D.), is discussed and illustrated.

The rich coastal province of Fukien, hitherto practically unknown from an archaeological point of view, was investigated by Malcolm F. Farley of Fukien Christian university, Foochow. Many large kiln-sites of Han and later times, as well as a series of Han, T'ang and Sung tombs, found at Foochow, were reported; the material found not only ties in with Professor Janse's outstandingly brilliant work in Indo-China, but also with that of John Cox in Hunan province and Father Finn on Lamma island, off Hongkong. At Chaochowfu, Kwangtung province, Mr. Farley discovered an enormous kiln-site of Sung and Yuan dynasty period (960-1368 A.D.). The wares produced at these southern Chinese potteries were traded to Egypt, Mesopotamia, Syria and East Africa, and helped build the great international commerce for which China has long been famous.

Manchoukuo.—A number of mounded tombs on the T'ung-Kou plain, Chi-an district, were excavated by the education department of the Manchoukuo government under the direction of Dr. Kōsaku Hamada. Owing to Dr. Hamada's untimely death the work was finished by Dr. Hiroshi Ikéuchi and Dr. Sueji Umehara, and these two scholars have produced a magnificent volume covering the results. Many elaborate polychrome paintings, mostly on the plaster walls of the burial chambers, were found. On the basis of similar designs found on dated Chinese mirrors, as well as the lack of Buddhist influence in the art, the tombs are considered to belong to the 5th century A.D.—the oldest to about 427 A.D., when the Kao-kou-lian capital was moved from T'ung-Kou to Heijō.

Archery.

An outstanding feature of the 60th annual tournament of the National Archery association, which was held at Amherst, Mass., Aug. 5-10, 1940, was the shooting of 18-year old Miss Ann Weber of Bloomfield, N.J., who not only won the ladies' championship, but, in doing so, established

new records in the Single and Double National round (71-513 and 143-979), the Single and Double Columbia round (72-582 and 144-1,148), the Single and Double American round (90-666 and 180-1,302), and in the team shoot (96-718), seven records in all. The men's championship was won by Russ Hoogerhyde of Northbrook, Ill., who set up new records of 90-726 and 180-1,428 in the Single and Double American rounds. Miss Mary C. Thompson of Phoenix, Ariz., won the girls' junior championship, and Fred Folberth of Cleveland, O., won the boys' junior championship.

The ladies' flight shoot was won by Miss Glendolene Vineyard, Canby, Ore., with a shot of 394.1 yards; and the men's flight shoot was won by Curtis L. Hill, Dayton, O., with a shot of 481.2 yards. There were 265 archers who took part in this event.

The National Field Archery association, which was organized in 1939, held a series of tournaments to establish the field archer champion of the United States. This honour was won by E. Hill Turnock of Wilkinsburg, Pa.

The 11th Annual Intercollegiate Telegraphic Archery tournament, sponsored by the National Archery association, was held in May 1940, and brought out an entry list of 158 teams (1,204 individual archers), representing 109 colleges. The winning team was Team I of Los Angeles City college, Los Angeles, Calif.

During Nov. 1940, the National Archery association sponsored an Interscholastic Mail Match between teams of six archers, each representing high schools and other preparatory schools. In this event, first places were taken by the girls' team representing Bloomfield high school, Bloomfield, N. J., and the boys' team representing Will Rogers high school, Tulsa, Okla. (L. C. S.)

Architecture.

The year 1940 will be remembered for the wanton destruction of architecture by aerial bombardment. Aside from this the war upset the normal development of architecture by arresting civil building and by making peacetime theories of design invalid under aerial warfare. The invasion of France halted the artistic influence of that country on the world. No longer was it possible for artists of all nationalities to work in Paris, to study at the École des Beaux Arts; or for young architects from the United States to attend the American school at Fontainebleau, the American academy in Rome or to travel in Europe on architectural scholarships. Only the past and the activities of refugees continued to exert the European influence on the architecture of the Americas, Palestine or the European colonies.

While Europe's role in the development of architectural progress and influence was temporarily terminated, some progress in architecture continued in the United States for the larger part of the year. There, various schools of thought furthered the growth of the new architecture rising out of industrial and scientific advances as well as social changes. The new problems brought about by an ever-increasing use of the motor car affected towns and buildings; urban areas were broken up into a series of suburban centres; superhighways, large span bridges and vehicular tunnels were built. Street congestion crowded stationed automobiles off the public thoroughfares and in the planning of many buildings automobile parking provisions were incorporated in new ways. The opening of the landscape by more extensive highways and parkways and a greater concern for leisure-hour activities brought more parks and playgrounds, new bathhouses, park pavilions, and camps or hostels. Changes in industrial production and increasing wages in the building trades reduced the use of craftsmanship and increased the use of standardized prefabricated units. Before

the war curtailed civil building in the various countries the aim for social betterment led to the construction of housing, clinics, health centres and recreational projects. The economic pressure diminished luxury building and caused a simpler architectural expression. However, in the totalitarian countries building designs were elaborated in keeping with the pomp of propaganda. Governments continued to control a large volume of building and influenced the development of architecture by establishing examples of national styles or by hampering experimentation with forms of architectural expression.

It can be assumed that the year 1940 ended a period of important architectural development which extended between two wars. The first decade thereof gave birth to revolutionary architectural thought which resulted in the beginnings of functional architecture in France and Germany. The second decade saw the gradual spread of this new architecture to the other countries of the world. At the end of this period the new architecture had progressed in the democracies from abstract theories to concrete expressions influenced by varying regional differences, while in the totalitarian countries it had been replaced by national styles.

Modern Architecture.—Modern architecture was not so much concerned with a conscious effort to produce beauty as with a truthful interpretation of everyday life. The architectural examples of note were buildings devoted to shelter, to work, to the care of the sick, to social services, to recreation or to transportation. The changed appearance of the buildings was due to two causes. First, new styles were evolved to produce a superficial change on the façades and the interiors by the use of: new surface treatments with variations in ornamentation; curved walls sometimes inspired by streamlining; freakish motifs added for sensational effects. As none of these had any real functional justification in the plans they were only pseudomodern and became identified as a modernistic architecture. Second, the search for a reasoned expression of the technical, economic and social progress produced more revolutionary changes. This resulted in a new architecture which brought the functional, structural and aesthetic elements of the design into an organic unity and was thus known as functional or organic architecture. The year 1940 saw the general acceptance of the underlying doctrine of this architecture, leaving however its visual expression to further development. The forms which functional principles produced still varied with individual designs according to the allowances made for emotional reaction. The uncompromising scientific reasoning expressed in the writings of Le Corbusier (functional architecture) as well as the more emotional approach of Frank Lloyd Wright (organic architecture) found their following. The common premise to these variations was an avoidance of formulae or conventions in the effort to liberate the design of buildings from restraining influences. This resulted in the free or open plan which considered the interior ahead of the exterior and eliminated solid enclosures wherever possible; thus were created interpenetrating spaces devoted to different functions (e.g., lounging, dining, reading) which were only separated from the outside spaces by sheets of glass. Symmetry had disappeared. Progress in the development of this architecture was indicated by greater concern for the varying local conditions of climate, available building materials and temperaments; it therefore became less international and more regional in character. The spread of modern architecture in the United States is best illustrated by the fact that in its *Guide to Modern Architecture, Northeast States* the Museum of Modern Art of New York lists the names of approximately 240 architects and designers. The periodical *Architectural Forum* devoted an issue to the substantial accomplishments of 1931-40 in relating machine-inspired design to a machine-inspired way of life.

Traditional Architecture.—Many causes remained for the perpetuation of traditional architecture. There existed a desire to recreate the past or to glorify a nationalistic ideal by using the decorative elements of richer historic periods. It was also found expedient to have established patterns or prototypes to draw on when large organizations or governments wished to set a style. Furthermore, the growing feeling of nationalism combined with the effort to unite behind one popular conception and the fear of foreign influences restrained the modern movement. The general public still failed to appreciate the intellectual reasoning behind the unfamiliar appearance of functional architecture. Also the business interests behind building capital feared that the stability of the property values might become upset by a too drastic architectural change or that the volume production of modern houses necessary for profit would not be reached until the new architecture became popular.

Materials and Methods.—It became more generally recognized that the prefabrication of entire houses was not practicable. Efforts were directed towards the standardization of units like doors, windows, etc., and the prefabrication of standardized sections like wall or floor panels. Scientific developments added some new materials. New plastics found decorative usages. Plywood continued to increase in importance as a universal material for structural and decorative purposes. Likewise glass underwent further developments to extend the possibilities of its use in buildings; for example, glass doors and furniture without steel or wood edges made their appearance.

Examples of Recent Architecture.—The war in Europe shifted the scene of architectural development to the United States. The designs of Frank Lloyd Wright, the pioneer of the modern movement in the U.S. were exhibited at the Museum of Modern Art in New York. In California the functional houses, international in character, by Richard Neutra commanded interest. Greater recognition of local conditions became evident in some small houses by the architects William W. Wurster, Harwell H. Harris and others. The eastern states likewise developed their own characteristics of modern architecture, which in 1939 were seen in a house on Mt. Desert island, Maine, by George M. Howe, in the following year in an exhibition house for *Collier's* magazine at Rockefeller Center, New York, by Edward D. Stone and also in several houses built by some of the younger architects. The New York World's Fair in its second year decided to show interiors of modern homes. New York's Metropolitan Museum of Art displayed modern house furnishings against modern architectural backgrounds. The controversy between modern and traditional architecture was illustrated by competing displays in an exhibition entitled "Versus," held at the Architectural league in New York. The premise that buildings are integral parts of communities and that architectural design does not stop with the walls of a building was shown in theory in the exhibition "Telesis" at the San Francisco Museum of Art and in practice in the parkways, parks, bathing beaches, bridges and tunnels executed in New York under the direction of Commissioner Robert Moses.

Parking provisions were incorporated on the roof of a store building for Sears, Roebuck and Co. at Los Angeles (John S. Redden, architect, and John G. Raben, designer). A church was proposed for Kansas City, Mo. (Frank Lloyd Wright, architect), with space for automobiles on several levels. The Lake County Tuberculosis sanatorium at Waukegan, Ill. (William A. Ganster, W. L. Pereira, architects), gave a clear expression to the functional requirements. Good modern architecture was likewise found in many industrial buildings, for example in the work of Albert Kahn, Inc., architects and engineers, or of the Austin company, engineers and builders. The defence program brought great activity in the construction of factories and housing for

troops and industrial workers.

In *England*, war construction practically excluded all other building and made air-raid precaution its primary concern. Efforts were directed towards camouflage, protection against damage from bombing and the provision of shelters. Prefabrication played a role in the rapidly erected evacuation camps for children. The building centre in London exhibited blacked-out protected shop fronts. Some buildings planned for social needs before the war were completed; nurses' homes, health clinics, a working-girls' club and sports pavilions. A modern design selected in an architectural competition for a town hall at Wembley (Clifford Strange, architect) was executed. Greater adherence to traditional character was shown in the Wiltshire county offices at Trowbridge (P. D. Hepworth, architect).

Italy found itself engaged in the preparation of a world's fair for 1942 in combination with ambitious plans for the beautification of Rome. Some buildings of the exposition were completed and a large amount of materials for the remainder was on hand at the beginning of the war. Traditional motifs inspired by the architecture of imperial Rome appeared in the embellishment of buildings, avenues and squares.

Germany also had its national style of which the Reichskanzlei in Berlin was one of the most grandiose and the last important example to be completed before the war. A building for the flag regiment of the air force best illustrated the expense and careful planning which typified German military preparations. Here trees and the natural landscape served as protection against aerial warfare.

Switzerland remained isolated from the regimentation of thought practised in the countries around it. For example, the Technical school at Berne (Hans Brechbühler, architect) expressed the principles of modern architecture brought out by Le Corbusier in using a skeleton block on stilts with a glass front for its architectural form.

Finland was the first country to begin a reconstruction program. Alvar Aalto, best known for his library at Viipuri, was appointed chief architect. In his prewar design for the Gullichsen residence at Norrmak, he used an unusual free plan with movable partitions. The town of Helsinki provided a large stadium with an imposing reinforced concrete tower (Yrjö Lindegren, architect) in preparation for the Olympic games which the war prevented.

Palestine continued to produce some interesting modern architecture. Eric Mendelsohn, a refugee from Germany who had also made a reputation in England, built the Hebrew university medical centre on Mt. Scopus outside Jerusalem.

The architecture of the British colonies also deserves consideration. An imposing office building in style not dissimilar from many in the United States was built for the Anglo-American corporation of South Africa (Sir John Burnet, Tait and Lorne, architects) at Johannesburg.

In Pretoria, many new buildings showed the spread of modern functional architecture.

Arco, Georg Wilhelm Alexander Hans, (1869–1940), German radio engineer, was born in Grossgorschuetz Aug. 30. He served as an officer in a battalion of a guards regiment in Berlin for three years, leaving the army in 1903 to devote himself to scientific work. After studying in Berlin university and the technical high school at Charlottenburg, he was employed as an engineer by the General Electric company of Berlin. He was responsible for the establishment of the broadcasting station at Nauen and for the formation of the Telefunken Gesellschaft, of which he was the first chief engineer. Arco, known as the Marconi of Germany, died in Berlin on May 7.

Areas and Populations of the Countries of the World.

The table that follows gives the latest known figures of the area in square miles, the population in thousands and the population per square mile of the different countries of the world.

Name of State	Area (in Square Miles)	Population (ooo's omitted)	Population per Square Mile
Afghanistan	250,900	10,000	39.9
Albania	10,800	1,120	103.7
Andorra	191	5	26.2
Argentina	1,079,965	13,129	12.1
Australia, Commonwealth of	2,974,581	6,907	2.3
Belgian colonial empire	960,000	22,298	23.2
Belgium	11,775	8,396	712.2
Bohemia-Moravia (Protectorate) as of March 1939	18,914	6,794	359.2
Bolivia	419,470	3,308	8.1
Brazil	3,291,416	45,002	13.7
British colonial empire	4,012,396	71,433	17.8
Bulgaria	39,814	6,371	160.0
Burma	261,610	16,000	61.0
Canada	3,729,665	11,484	3.0
Chile	289,776	5,001	17.0
China, total	4,480,992	450,000	100.4
China Proper	2,993,475	422,708	145.6

World Totals	55,910,294	2,640,252	47.2

Argentina, a republic on the Atlantic coast of southern South America and second largest country of the continent; language, Spanish; capital, Buenos Aires; president, Dr. Roberto M. Ortiz (acting president, Ramón Castillo). The area is 1,079,965 sq.mi., slightly over a third of that of the United States.

No official census has been taken since 1914, but the population was officially estimated (Dec. 31, 1939) as 13,129,723. The percentage of whites exceeded that of any other American country except Canada, with native-born of European stock, 76.9%, mixed bloods, 3.2% and foreign-born (almost entirely European), 19.9%. A majority was of Spanish stock, an estimated third of Italian or part-Italian. Nearly 250,000 were German or part-German in blood. The chief cities (with 1939 est. pop.) were in 1940: Buenos Aires, 2,364,263 (3,700,000 with its suburbs); Rosario, 513,000; Avellaneda (a Buenos Aires suburb), 386,000; La Plata, 248,000; Córdoba, 213,000; Tucumán, 147,000; Santa Fé, 147,000; Bahía Blanca, 115,000; Mendoza, 82,000; Paraná, 72,000.

History.—The government is federal in form with legislative power vested in a bicameral congress.

The political storm, brought on late in 1939 by Pres. Ortiz's determined campaign for honest elections, continued with greater fury in 1940, reaching its peak in March. On Feb. 19, the president exercised his constitutional prerogative and intervened in Catamarca province, setting aside fraudulent elections there. A few days later, after challenged elections were held in Buenos Aires province (pop. 3,500,000), similar action was taken there. As interventions were directed against the Conservatives, who had elected Dr. Ortiz in 1938, a political crisis was precipitated and two cabinet members resigned. Ortiz was largely deserted by the Conservatives and, in effect, went over to the Radicals. Congressional elections in March gave the Radicals control of the lower house of congress for the first time since 1930.

Full effect of the sweeping purge was prevented, however, by Pres. Ortiz's serious illness, which compelled him on July 3, 1940 to relinquish office to Vice-Pres. Castillo, an old-line Conservative entirely out of sympathy with his internal policies. In August political scandal rocked Argentina, as a senate investigating committee involved the minister of war in a huge land fraud. Although still bedridden, Pres. Ortiz temporarily resumed office and, declaring the charges to be a reflection upon him personally,

tendered his resignation to congress. When this was rejected by a vote of 170 to 1 (Aug. 24), he again turned executive power over to Castillo. On Sept. 2, a new cabinet composed entirely of moderate Conservatives was organized.

Argentina's international relationships during 1940 were motivated by three major factors which tended to pull her in divergent directions: the activities of pro-nazi fifth columnists in the country and the generally alarming European situation; a long-standing close relationship with Great Britain; and a traditional distrust of the United States, accentuated by unsatisfactory trade relationships, but modified by the Roosevelt good neighbour policy.

The presence of the crew of the German battleship "Graf Spee," scuttled within the mouth of the Rio de la Plata in late Dec. 1939, brought serious problems. Propaganda activities of some of the "Graf Spee's" officers and men and the escape of many of them from internment aroused considerable Argentine resentment and served to turn public opinion more and more against the axis powers. Feeling was further intensified by revelation of the propaganda activities of the nazi-subsidized newspaper *Pampero* and of numerous fifth columnists. In the latter part of the year these activities centred especially in the northeastern territory of Misiones. Isolated from Argentina as a whole and nestling between Germanophile southern Brazil, politically unsettled Paraguay and fifth columnist infested Uruguay, Misiones was strategically nearly ideal for revolutionary activity by pro-nazi groups and great difficulty was encountered by the government in its efforts to suppress fifth columnism there and elsewhere in the country.

Argentine sympathy toward Great Britain, long her best customer and chief provider of imports, continued strong. British purchases of Argentine meats reached gigantic proportions, but full economic benefit was precluded by British impounding of the proceeds, a policy which brought about an acute shortage of foreign exchange with which Argentina might meet obligations elsewhere. In Oct. 1940 an Argentine cattlemen's committee formally offered to restock all visiting British warships with fresh meat free of charge and in December a similar group donated 6,000 head of cattle to the British government. On Oct. 11 British contracts for foodstuffs, especially meats, for the ensuing 12 months were reported to aggregate between £25,000,000 and £40,000,000 sterling.

Argentine relations with the United States revolved about two major sets of problems: economic and trade difficulties between the two; and hemisphere defence and their relations in general to the European war. The first arose from the competitive nature of the products of the two countries and the long-continued "unfavourable balance" of trade with the United States, with the United States' discrimination against Argentine meats, an additional irritant. Reciprocal trade negotiations carried on during 1939 were abandoned in Jan. 1940 in the face of strong opposition from cattle-producing sections of the United States and the internal political dangers involved. When Argentine purchases in the United States doubled during the early months of the year, the foreign exchange problem became increasingly acute and, in July, Argentina began restricting imports from the United States to the point of a virtual embargo in September. In Dec. 1940, however, credits of \$110,000,000 were obtained from United States governmental agencies, with \$50,000,000 allotted specifically to currency stabilization.

Closely tied to economic relationships with the United States was the question of hemisphere solidarity in the face of the European war. At the Havana conference in July (see HISPANIC AMERICA AND THE EUROPEAN WAR), although refusing assent to some of the more sweeping proposals, Argentine delegates gener-

ally worked in harmony with those from other American republics. Late in the year, strong protests were made at the proposed Uruguayan concession of naval base rights to the United States (*see URUGUAY*), although in general a willingness to join in hemisphere defence plans was indicated.

European developments had profound effects upon Argentina and stimulated a demand for the development of adequate defences. In July 1940 defence appropriations in excess of 1,100,000,000 pesos were approved. Owing to the extreme vulnerability of the 1,800-mi. coast line, strong emphasis was placed on naval and aviation improvement. Improvement of naval and air bases along the Patagonian coast was begun and, in November as part of a Pan-American defence co-ordination move, high Argentine army officials visited the United States to view that country's defence activities. During the year commercial treaties were made with Brazil, Colombia and Japan.

Education.—Education is free and compulsory. In 1938, 14,071 educational establishments (12,500 state-supported), with 2,074,000 enrolment (1,901,000 in state-supported schools) included 13,298 primary (enrolment 1,915,593) and 749 secondary schools (129,000 enrolment). Six national and one private university have over 28,800 students. The national universities of Buenos Aires and La Plata have high international standing.

Army and Navy.—Argentina has compulsory military or naval service. The army personnel numbers 49,705 active and 282,503 reserves. The navy, strongest in South America, comprises two battleships, three cruisers, 16 destroyers, three submarines and a number of smaller craft. There is a marine corps of nearly 4,000 and 470 aeroplanes of all types (over 100 first-class) supplement other defence forces.

Finance.—The monetary unit is the peso, valued (Dec. 1940) at approximately 23½ cents U.S. (unofficial rate). The 1940 budget as readjusted late in the year calculated 1,108,939,000 pesos expenditures, 915,864,000 pesos receipts, but in September, the actual deficit was officially forecast as 120,000,000 pesos.

Trade and Commerce.—In 1939, Argentina's imports (primarily textiles, petroleum products, machinery and miscellaneous manufactured goods) were valued at 1,338,332,419 pesos, a decline of 8.1% from 1938 and came chiefly from Great Britain (19.9%) and the United States (17.2%). Other countries supplying imports included Germany, 9.1% (1938: 10.1%); Belgium, 6.5% (1938: 5.2%); Brazil, 6.5% (1938: 4.7%); France, 5.6% (1938: 4.3%); Netherlands West Indies, 4.1% (1938: 3.7%); Peru, 4% (1938: 4.4%); British India, 3.9% (1938: 4.4%); Italy, 2.7% (1938: 2.7%); and the Netherlands, 2.4% (1938: 1.9%).

Exports in 1939 were 1,573,173,178 pesos, a 15.3% increase over 1938. Agricultural products comprised 48.7%; livestock, 43.7%; forest products, 3.04%; mineral products, 1.2%; others, 3.23%. The increase was due chiefly to a 17.2% rise in livestock exports. Exports were taken especially by Great Britain, 35.9% (1938: 32.8%) and the United States, 12% (1938: 8.5%). Germany took 5.7% against 11.7% in 1938. Other customers included the Netherlands, 8.1% (1938: 7.4%); Belgium, 7% (1938: 7.4%); France, 4.8% (1938: 5.4%); Brazil, 4.3% (1938: 7%); Italy, 2.1% (1938: 2.5%); Sweden, 2.1% (1938: 1.8%).

In the first 11 months of 1940, imports increased 17.9% over 1939, to 1,409,871,000 pesos (United States, 21.28%; Great Britain, 15.1%); exports declined 6.3% to 1,328,123,000 pesos (Great Britain, 36.37%; United States, 15.9%). In the first 9 months of the year, exports declined 18.2% in volume (livestock products by 9.1%, agricultural by 19.7%); livestock export values increased 11.3%, although agricultural export values were 8.4% less. Meats, off 5.5% in volume, rose 7.6% in value. New British contracts totalling nearly £40,000,000 were expected to

enhance exports materially in 1941.

By far the greatest part of Argentine external commerce is handled through Buenos Aires, which is served by numerous steamship lines, and is the hub of the country's intricate railway system. Bahía Blanca to the south and Rosario on the Paraná are also important. Comodoro Rivadavia, in southern Patagonia, is the centre of the petroleum industry. Railway connections link the country with Bolivia, Paraguay and Uruguay. Communication with Chile has been by combination bus and railway service over the Transandine railway route since landslides interrupted through service in 1934 and by similar facilities through Bariloche and the lake region in the south. The Transandine, purchased by the government in 1939, is in process of reconstruction and rehabilitation. By a treaty with Bolivia in 1940 Argentina undertook to construct a 62-mi. railway from the border into the Bolivian oil fields. During 1940, shortage of shipping facilities due to European war disruptions precipitated some agitation for the development of an Argentine merchant marine. External air service by Pan American Airways via the east coast of South America was improved during the year by establishment of tri-weekly service and shortening of time between Buenos Aires and New York to 48 hours. There is almost daily Transandine service to Chile, frequent service to Montevideo and regular connections with Paraguay. Transatlantic service via Brazil formerly provided by French lines was suspended in 1940 owing to war conditions. A German service, suspended in Sept. 1939, was resumed in March but again abandoned in Nov. 1940. Internal aviation lines aggregate 10,607 km. in length.

In 1939 there were over 400,000 telephones in Argentina (over 50% of them in Buenos Aires), as many as in all the rest of the continent. State-owned telegraph lines totalled 47,270 km. in length. There were 48 radio broadcasting stations. Nine were state-owned.

Argentina has approximately 43% of all South American railway mileage and ranks sixth in the world, with a 1940 total of 42,099 km. (not including nearly 9,000 km. of port, industrial and other rail lines). The highway system exceeds 300,000 km. in length, with 17,000 km. paved. In 1940, approximately 97,000,000 pesos were spent on highway extension and improvement.

Agriculture and Livestock.—Argentina's revenues are primarily agricultural and pastoral, with 10.8% (74,130,000 ac.) and 44.4% (306,404,000 ac.) respectively of the country's area devoted to them. The chief agricultural products are cereals and linseed. The bumper 1939-40 corn crop of 10,640,000 tons was more than double the previous year's crop and exceeded the five-year average by 26%. The government appropriated 100,000,000 pesos to purchase the excess and experimented with unshelled corn for railway fuel. A large portion of the crop was converted into alcohol. A similar surplus of wheat (crop estimate, 3,251,000 tons) was likewise handled by government purchase on an understanding of reduction in acreage in 1941. Linseed, in whose production Argentina leads the world, was estimated at 1,014,400 tons. Other important grain crops (with 1940 estimated tonnage) were: oats, 872,600; barley, 851,100; rye, 345,000; birdseed, 26,500. Important non-grain crops include cotton (74,200 tons in 1940), grown principally in Chaco territory; sunflower seed (325,000 tons); sugar cane (521,600 tons in 1939); potatoes (1,161,000 tons). Fruits are extensively produced in Mendoza and other provinces along the eastern slope of the Andes and in Patagonia. In 1939, 51,369 tons of fruits were exported (pears and apples, 39,890 tons; grapes, 9,256 tons). Rice and tobacco are important, although considerable quantities are imported.

Agriculture and livestock together account for 90% to 95% of all exports. The livestock census of 1937 showed a total of 43,790,166 sheep, 33,100,152 cattle, 8,527,181 horses, 4,875,990

goats and 3,975,716 hogs. Beef and mutton, in canned and chilled form, are a leading export. Heavy British purchases of meat were anticipated for 1941. The dairy industry is increasing in importance. The fishing industry, although still small, is rapidly expanding.

Forest and Mineral Products.—Timber is very limited except in the subtropical north, where there is extensive development of quebracho, source of tannin, of which Argentina produces two-thirds of the world's supply. Quebracho exports in 1940 declined over 25%. Maté (Paraguay tea) is also heavily produced, chiefly for domestic consumption, but serious overproduction has developed since 1938.

There is very little mineral wealth other than petroleum, although some coal deposits exist in Neuquén territory. Argentina ranks 11th in world petroleum production, with a record output of 18,614,660 bbl. in 1939 (1940 est.: 20,476,100 bbl.). Fields in and around Comodoro Rivadavia in Chubut (southern Patagonia) account for over 75% of production. Other fields are in Salta and Jujuy, in the extreme northwest, and in Neuquén. State-owned fields provided 55% of the 1939 production. All new fields are reserved by law for state exploitation. Domestic production took care of 56.9% of Argentine consumption in 1939.

Manufacturing.—Manufacturing has undergone extensive development since 1933, especially under the stimulus of European interference with normal sources of supply. Credits granted by the United States Export and Import bank in Dec. 1940 were expected to go, in part, to aiding new industries. (L. W. BE.)

Arizona. The "Apache state," is a state in the southwestern part of the United States of America. It is bounded north by Utah, east by New Mexico, south by Mexico and west by California and Nevada, the Colorado river separating it from California and in part from Nevada. One of the two youngest of the United States, it was admitted with New Mexico in 1912. Area, 113,956 sq.mi.; population, according to the U.S. census of 1940, 499,261. The capital is Phoenix with a population of 65,414. Of the total population of 435,573 in 1930, 264,378 were native and foreign-born white, 10,749 Negroes and 160,446 other races, chiefly Mexican and Indian.

History.—The state officials in 1940 were: chief justice, Henry D. Ross; governor, Robert T. Jones; secretary of state, Harry M. Moore; attorney-general, Joe Conway; treasurer, William Peterson. At the November election of 1940 Sidney P. Osborn was elected governor; Joe Hunt, treasurer; and Alfred C. Lockwood became chief justice. In the presidential poll Roosevelt received 95,267 votes; Willkie, 54,030. Ernest W. McFarland was elected U.S. senator, having defeated Senator Henry F. Ashurst in the September primary. Governor Jones called a special session of the legislature late in September to consider a number of measures. Six of these were passed: provision for eradication of dourine; amendment of the unemployment compensation law of 1936 to conform to the provisions of the railroad unemployment insurance

act; provision for tax anticipation bonds; authorization of city bonds for waterworks; creation of a Coronado centennial commission; and confirmation of six recess appointments.

Charities.—In Nov. 1940 there were 38,664 persons receiving some form of public aid, with a total monthly expenditure of \$443,170.74.

The number aided was in excess of that for the same period of the previous year, but the expenditure was less.

Agriculture and Mining.—Citrus fruit, cotton, lettuce, and beef cattle comprise three-fourths of the value of farm products of Arizona. Arizona is the sole U.S. producer of Egyptian or long staple cotton. In 1940 there were 156,000 ac. of short staple with an estimated production of 159,000 bales, and 66,000 ac. of long staple with an estimated production of 37,000 bales. Arizona excels in the production of beet sugar seed with 4,360 ac. harvested in 1940. Grapefruit was estimated at 2,700,000 boxes from 14,000 ac. Two crops of lettuce were harvested. The spring crop for 1940 was 7,325 cars from 13,900 ac. The production for the previous autumn which continued into 1940 was 4,821 cars from 15,000 ac. Owing to the continued high price of copper, production of that metal for 1940 probably exceeded that of 1939 which was 518,400,000 pounds. The Phelps Dodge corporation continued its development work at Morenci. A wage increase of 5% became effective Oct. 7 for several thousand miners at various mining centres in the state.

(H. A. H.)

Arkansas, twenty-fifth state of the United States, is one of the south-central states. Its boundaries are north Missouri, east the Mississippi river, separating it from Tennessee and Mississippi, south Louisiana, and west Texas and Oklahoma. Its area is 55,335 sq.mi.; population (1940), 1,949,387. Capital, Little Rock, 88,039; Fort Smith, 36,584; Hot Springs, 21,370; North Little Rock, 21,137; Pine Bluff, 21,290; El Dorado, 15,858; Texarkana, 11,821.

History.—The following state officials, all Democrats, were inaugurated on Jan. 14, 1941, for a two-year term: Homer M. Adkins, governor; Bob Bailey, lieutenant governor; C. G. Hall, secretary of state; Jack Holt, attorney-general; Otis Page, land commissioner; Earl Page, treasurer; J. Oscar Humphrey, auditor; J. S. Holt, associate justice of the supreme court.

The outstanding events of the year were the elections, primary and general. Governor Carl E. Bailey sought a third term, but Homer M. Adkins defeated him by a large majority. Three other officials were elected for third terms. The communist party was ruled off the ballot by Secretary of State Hall on the ground that it did not "subscribe to the principles of Americanism." The party did not appeal to the courts. In the presidential election Mr. Roosevelt received 158,622 votes, Mr. Willkie 42,224. Roosevelt's vote was larger than in 1936, but smaller than in 1932. Willkie's vote was larger than that of Landon in 1936 or of Hoover in 1932. Adkins, Democratic candidate for governor, received 184,578 votes; Stump, Republican, 16,600.

Education.—The amount spent on public schools for 1939-40 was \$14,023,914. The number of children of school age was 624,575; number enrolled, 472,014; the average length of the school term was two days short of eight months. Commonwealth college, which was founded 18 years ago to train labour leaders, was fined \$2,500 in Sept. 1940 in a justice of the peace court on a charge of "anarchy, displaying an illegal emblem, and failure to display the United States flag." No appeal was taken. In December the library and other movable property were sold to pay the fine. The college was closed in 1940.

Banking and Finance.—The number of national banks has been reduced to 49 by one failure. Two state banks failed and several were liquidated. Otherwise the banks, state and national, had

SIDNEY P. OSBORN, a Democrat, was elected governor of Arizona Nov. 5, 1940

a prosperous year, the loans, discounts and deposits being considerably larger than in 1939. The assessed valuation of property in 1940 was about \$160,000,000 below that of 1929. Tax delinquencies were large, especially on personalty, but the special taxes collected in 1940 were \$2,000,000 above those of 1939, the tax on gasoline being 6% higher. There was an increase in the severance tax collections, due to government orders for timber.

HOMER M. ADKINS, Democrat, won Arkansas's gubernatorial election Nov. 5, 1940

Agriculture, Manufacturing and Mining.—The total income of the state for 1940 was \$447,000,000, a new high for ten years. The decline in cotton acreage was 3,933,000 in 1933 to 2,187,000 in 1939, but the decline in production was only from 1,435,000 to 1,410,000 bales. There was an increase in livestock of 10.4%, that in hogs being 100%. The estimated production for 1940 was somewhat higher than for the previous year: cotton, 1,540,000 bales, worth \$73,389,500; cotton seed, 687,031 tons, worth \$15,801,713; corn, 42,903,000 bu., worth \$28,874,160; hay, tame and wild, 1,349,000 tons, worth \$10,255,420; rice, 10,047,000 bu., worth \$6,831,960; Irish potatoes, 3,895,000 bu., worth \$3,310,750; sweet potatoes, 2,975,000 bu., worth \$2,677,500; apples, 675,000 bu. worth \$711,450; grapes, 9,600 tons; pears, 204,000 bu. The total value of all farm products probably will run over \$145,000,000. The apple crop suffered a decline, partly because of discriminatory freight rates. The grape growers were helped by grape juice and winery plants. There was a decrease in mortgage debt from \$99,000,000 in 1929 to \$63,000,000 in 1940 and a lowering of interest by 50%. Six years ago a young Arkansas couple started out as tenant farmers with \$25.19. They have since purchased 38 ac. and in 1940 they had a total income of \$3,042 and won the \$500 mid-south sweepstakes over 41,328 contestants. Thrift, diversified farming and intelligent planning did it. New and expanded manufacturing plants added \$570,200 to investments. The leaders were lumber, 53 plants with \$1,168,500; mining, quarrying and milling, 28 plants with \$1,114,000; refineries, two plants with \$1,000,000; food, 36 plants with \$426,500. The tourist industry reached \$500,000. The building industry was the largest since 1929. The construction of Camp Joe T. Robinson for military training near Little Rock utilized 39,500 ac. and caused the moving of 340 families, over half of whom were owners. The mineral production rose from \$13,000,000 in 1933 to \$26,000,000 in 1939 and \$32,974,389 in 1940. The leader was petroleum, 25,758,367 bbl., worth \$21,268,070; followed by coal, 1,127,588 tons, worth \$3,980,388; bauxite, 475,507 long tons, worth \$2,724,660; natural gasoline, 19,000,000 gal., worth \$665,000; and stone, 417,162 tons, worth \$553,356. Lead, zinc and cinnabar felt the impulse of the defence program. The increase in coal was largely because of the demand of St. Louis, Mo., for something to abate the smoke nuisance. (D. Y. T.)

year opened with continuation of the war between Germany and the Allies, England and France. Russia was at war with Finland. The Japanese continued their invasion of China.

The campaigns in Europe revealed the characteristics of the contending armies. Germany, Denmark, Norway, Holland, Belgium, France, England and Italy—eight armies in all, were engaged in combat during a part or all of the year. This review of these armies has been made in relation to the campaigns. Censorship and other restrictions limited the accuracy of information available for consideration. The armies have been considered in turn, in relation to prewar conditions and the results of the principal campaigns. Complete analyses should include examinations of naval activities and those political developments leading to or resulting from combat.

The German Army.—Man Power.—The German army was mobilized, victorious in Poland and engaged in war as the year opened. Prewar estimates placed the strength of the army at slightly more than 8,000,000, including semi-military organizations. Wartime estimates indicated about 6,000,000 men actively engaged, while a reserve potential of 2,000,000 could be made available for service. These estimates included about 380,000 for the air services, which constituted a separate force. In peacetime, the army consisted of around 55–65 divisions. In wartime, a total of 150 or more divisions could be organized. The air services were estimated to include around 350 active and 150 reserve squadrons.

Theory of Combat.—While the theory of combat was based on the immutable principles of war, the German army adopted a method of application popularly known as blitzkrieg or "lightning war." This theory was developed as a result of the provisions of the treaty of Versailles. Germany was permitted an army, the reichswehr, of 100,000 officers and men. Severe restrictions on arms and equipment, including practically complete disarmament, were designed to prevent the rise of German army strength. General Hans von Seeckt, head of the German forces, developed the theory that due to limitations on size, the German army could be employed only in a short war. Developments in mechanical weapons, tanks, aviation, etc., prompted the adoption of such an approach. His view was that a small army well equipped, could wage successfully a short war against a nearby opponent before the enemy could fully mobilize its strength. Previous German military leaders had developed the idea of infiltration of small units to overcome the great defences in depth of the war of 1914–18. The theory of "lightning war" was an extension of this development permitting repeated employment of independent units operating against weak spots in enemy defences to create openings for the advance of heavily armoured and mechanized units to exploit the gaps and pave the way for large masses of infantry-artillery ground forces. (See LIGHTNING WAR.)

Denmark-Norway.—The German invasion of Denmark met with little resistance, and occupation was completed without open conflict between the German and Danish forces. The objective in Denmark was limited to the occupation of that country in order to establish air and naval bases for launching an extended invasion into Norway. In addition, Germany sought bases to protect shipping through the Cattegat and Skagerrak.

The invasion of Norway by the German army was a carefully planned employment of the German theory of lightning attack. The principal objective of the German army was the capture of air and sea bases to deny them to Britain. Shipments of Swedish ore would be protected and German access to the sea assured. Large German forces were not employed. Germany placed naval forces disguised as merchant sailors in commercial vessels within the open harbours of Norwegian ports. These forces seized and held a number of landings for German units. The first stage of the battle between air and naval forces was inaugurated during

Armies of the World. The principal armies of the world met in great military engagements during the year 1940. The armies of the dictator states were opposed to the democracies in Europe, in Africa and in China. The

the campaign. Great Britain employed only a small part of her naval forces. German land units were sent to Norway by air and sea. Norwegian forces were small. Large masses of German ground forces were not needed, since terrain features, distances to be travelled and the time factor precluded their use.

Holland.—The campaign in Holland was minor and preliminary to the main effort through Belgium. It illustrated only two phases of the new methods of war; *i.e.*, war of nerves (fifth columnists) and aerial parachutists and aerial infantry. The employment of parachute troops and air infantry resulted in spectacular success, due to surprise and novelty of attack. Parachute troops seized and held the Moerdijk bridge, outflanking the main Dutch water defences and cutting off reinforcements from the south. The German-Holland border was the closest outlet for German approach to the North sea. The water defences of Holland actually limited the manoeuvre area for Dutch forces. These terrain features, the seacoast and flooded border defences, determined the German plan of invasion. Germany attacked from the air to seize critical points in the back areas and to capture points that would insure the rapid advance of the main ground forces. Once these bases were captured Dutch defences were reversed, and later disorganized. Germany had quick access to undefended Dutch seaports.

Belgium.—The invasion of Belgium was simultaneous with the invasions of Holland and Luxembourg. These invasions were all one campaign. They covered the front of the main German operations while lesser forces held before the Maginot line. The German approach to battle indicated the same idea of the von Schlieffen plan of 1914. An advance through Belgium would turn the French left and the Maginot line, and at the same time secure bases in Holland, Belgium and northern France for later operations against Britain. Valuable supplies, principally gas and oil, were additional objectives.

Air and ground forces in close co-ordination operated with initiative and aggressiveness against weak spots in the Belgian defences. The principal advance of German forces developed toward the heavily wooded Ardennes. Once through these defence positions, the German forces would be able to direct their advance toward Sedan. A critical part of the campaign was the decision of the Allied high command to leave the prepared positions along the French and Belgian frontiers and move large forces to the assistance of Belgium and, if possible, to the assistance of Holland. This decision meant that Allied troops would advance beyond the defensive line of the Meuse river and that the Allied left flank would be pushed out in the direction of Holland. Thus the Germans developed a "soft spot" north of Sedan, defended by few forces who apparently neglected to block advances by fighting or by destruction of the Meuse bridge. The Germans grasped this opening to push through large mechanized units in a great encircling movement. It is believed that the Germans did not necessarily "plan the campaign that way"; rather their methods were so flexible that they took advantage of the opening given them by the weak Allied forces, including the French army north of Sedan. The composition and organization of the German army indicated again that all units were trained to take advantage of air and mechanized weapons, and were led with initiative and aggressiveness along the lines of tactical opportunities created by local successes which were encompassed in a general strategic plan. While these operations are indicative of the co-ordinated efficiency of the German army, further study of reliable data may disclose such serious defects in the Allied actions as to present a somewhat different picture.

Retirement of British and French forces after their offensive into Belgium and eventual surrender of the Belgian army in Flanders, as well as the apparent failure on the part of these forces to make effective the decisions of higher commanders to launch

counterblows, are controversial questions for the study of future historians. Reliable information and actual facts available for sound conclusions accept that there is evidence that the mass of the Allied air forces were employed on distant strategical areas when better results might have been achieved by more direct support of the ground forces. These conclusions are supported by the change of air tactics during the withdrawal from Dunkirk where it appears that royal air forces secured such an air supremacy as to permit this complicated operation with relatively small losses to personnel. German air bombardment of Great Britain coupled with air and submarine attacks against supply lines continued throughout 1940 without decisive results. While attempts at invasion of Britain were alleged, evidence is not definite on this point.

Germany faced the questions of an immediate invasion of Great Britain, while German superiority was greatest, or the immediate subjugation of France, or a combination of these operations. Germany chose the course of immediate destruction of the remaining French forces, south of the Somme river. It is too early, and accurate facts available are too few, for definite comment on this decision. However, after the crossing of the Somme, General Weygand's efforts to meet the German advance appeared futile. Italy's entry into the war with a threat against the French flank and rear played further on the lowering French morale, so that finally real resistance disintegrated and French authorities accepted an armistice on German terms. Thereafter, the German army was employed on the continent in occupation of the conquered countries and in furthering the political extension of German national policy in the near east.

The air battle over Britain may be considered the attrition type of warfare. Observation flights were made to determine the character of British defences. Mines were laid by parachute along the coastal waterways. Industrial concentrations and other military objectives were bombed. Germany initiated full scale bombing against centres of civilian population. Attacks were made against merchant shipping, and patrol planes co-operated with submarine fleets. The principal activity of the German army was the employment of the air arm independently without the use of ground forces. Some heavy coastal artillery from positions along the French channel coast launched bombardment attacks against British coast defences.

The British Armies.—*Man Power.*—Prewar estimates indicate that the British forces approximated less than 600,000 including trained reserves. Air forces, including reserves were estimated at 80,000 to 85,000 officers and men. Conscription of man power offered the potential increase of approximately 4,000,000. In peacetime, about 10 to 15 divisions of all categories were active; however, only about one-third were well equipped and trained. In war this total could be expanded to provide up to 100 divisions, provided adequate modern equipment was made available. Any estimate of British man power must take into consideration the theatre of operations. Joined with an ally in a foreign theatre of operations, the size of British expeditionary forces is determined by the requirements of local combat. As an example, no force was sent to Poland in 1939. Time and distance determined the requirements of the local combat and prevented British participation. In France, British forces were estimated at not more than ten divisions.

Restrictions of censorship weaken the conclusions drawn. Irrespective of the final issue of campaigns in France, the British view of the particular requirements of that theatre and availability of munitions, determined the actual forces employed.

At the close of the year, Great Britain was fighting a purely defensive war on the home front. Under threat of invasion, the British forces increased enormously. Expansions in the home

guard, and the gradual inclusion of nearly all able-bodied citizens in defence works made any estimate a guess. Conservative estimates indicated that the home guard measured 1,700,000, armed and trained for defence service.

The defence of self-governing dominions is a dominion responsibility. However, dominion expeditionary forces were employed by Britain in the Mediterranean area and in Greece. Those forces, principally Canadian and Australian, were added to the small regular British garrisons and the local native troops in Egypt, Somaliland, Kenya and Palestine. British forces in the near east and in Africa were estimated at around 200,000.

In the air, British squadrons in peacetime were estimated at about 200, with approximately 50 of those in overseas possessions. No reliable estimate can be made of pilot strength in 1940 or over-all strength of the royal air services, due to wartime censorship.

1940 Campaigns.—The principal campaigns for the British forces were in Denmark and Norway, Holland, Belgium, France, North Africa and Greece. With the exception of air bombardment of Danish bases, Britain made little effort to prevent German invasions. In Norway, the size of British forces, the inadequacy of equipment and the apparent limitations on air and naval support, indicated that Britain was not prepared to resist strongly the German invasion. The British army played an unimportant role in Holland. Small naval units effected the withdrawal of British residents and the royal family. Some air units bombarded channel ports. In the Belgian and French campaigns the British played a principal part. British forces moved north into Belgium to aid King Leopold's armies. The dispositions proved to be unfortunate in providing opportunities for the advance of large German mechanized troops against weaker British ground forces. The air forces did not offer continuous assistance and mechanized forces appeared short in essential equipment. British forces withdrew behind Brussels and large numbers were eventually encircled. To the south, the British defended stubbornly around Dunkirk and succeeded in withdrawing the major portion of their forces. British losses in equipment were high, while available information does not indicate excessive losses in personnel.

In the Mediterranean area British forces were successful against larger Italian forces. The Italian invasion of Egypt was permitted with a view to forcing overextension of Italian supply lines. The Italian operations near Kenya and along the Abyssinian border were considered of minor importance. The invasion of Greece gave Britain the opportunity to occupy Crete, well located for employment of air raiders against southern Italy and to protect the Mediterranean. In the Mediterranean and North African areas, British forces were more actively engaged in direct offensives against Italian air forces and in conjunction with Greece were operating against Italy in Albania.

Theory of Combat.—The general war policy of the British is based upon defence of the outlying posts of empire and defence of the home front. Great Britain relies upon small regular garrisons in her possessions, increased by local native forces. All defence considerations rest upon the initial use of naval power. Sea power, rather than ground or air power, has always been the great potential of British strength. The rise of British air power results from necessity and is coupled with the need for home defence, as well as the air needs of the empire. Britain places great dependence upon naval blockade and control of the sea lanes of the world.

The theory of combat on the field for Britain has been the policy of defence; a defence strong enough to hold up an enemy offensive and eventually permit the delivery of a counterblow. The European war will no doubt develop these theories along lines of aggressive action with greater co-ordinated employment of the

three arms—navy, air and army.

There were signs of growing aggressive action by all arms in the operations against Italian troops, while the air arm continued to deny complete superiority to Germany over Britain. The tactical grouping of British air units consisted of a fighter command, including pursuit ships and anti-air defence units; an offensive command of bombers; and a coastal command for channel defence. To these should be added air forces with the navy.

The French Army.—Man Power.—Prewar estimates of the army in France indicated a strength of slightly more than 500,000, not including reserves. The peacetime division strength was placed at 35–40 with an estimated war increase to 150 divisions. Air forces were estimated at around 50,000 men with about 3,000 planes and approximately 60 active squadrons. Wartime army strength was estimated at 5,000,000 with a potential increase of 2,000,000 native troops of all classes. It is conservatively estimated that in 1940 France had an army in the field of close to 2,000,000 men, with at least another 1,000,000 in training. Air force figures were unreliable but the results of campaigns indicated less than above for the initial estimated strength on Sept. 3, 1939.

Theory of Combat.—The French theory of combat depended primarily upon the defence of fortified frontiers supported by counterattacks against an invader. The postwar period since 1918 was marked by French efforts to create political and military alliances to secure a potential strength which would delay invasion and produce sufficient forces to permit counter-offensives. The construction of formidable land defences and the reluctance to cross a frontier in preventative war were outstanding examples of this French theory of defence combat.

Campaigns—Belgium.—While holding the Maginot line with fortress troops, French forces with light equipment were moved from prepared positions along the frontier into Belgium to meet the German invasion. It appears that these French forces were inadequately equipped and were too small in numbers to stem the German advance. Contrary to the accepted doctrine of defence, these French forces assumed the offensive in what appear to be unco-ordinated efforts, advancing even beyond the line of the Meuse river. The continued thrusts of German mechanized columns through the Ardennes met slight resistance. The use of heavy tanks and the continuous and close co-operation of German air forces in the ground fight quickly overcame French, and later British, resistance. At no time did the French mechanized forces equal in number or in armament the strength of the invading columns. There appears to have been a shortage of mobile artillery and air forces. In this move failure to appreciate early the tactical situation created by the German advance along the Somme, coupled with the Belgian and British reverses, permitted the German outflanking advances to Amiens and the coast and eventually caused the collapse of the Allied operations by the withdrawal at Dunkirk. The French troops escaping this debacle joined Weygand's operations south of the Somme river and to the east.

The battle of France south of the Somme river is a striking example of the composition and organization of the French army employed in open warfare. French distributions resulted from hastily made decisions in view of the deep infiltration by independent German units. Liaison between French units was weak. Prepared defences were inadequate against co-ordinated air and ground attack. French forces lacked mobile weapons of all types and were particularly short in air and mechanized equipment to overcome the German air and mechanized columns. Apparently France counted too heavily upon stubborn Dutch and Belgian resistance and the impregnability of the Maginot line. National and military morale appeared below that essential to meet the sacrifices of such a war. The French organization for a war of movement was handicapped due to general reliance upon a defence attitude and not an offence or aggressive determination.

Summary.—The actual break-through, the encirclement and destruction of large French forces cannot be analyzed completely during conditions of wartime censorship. The army in France was decisively defeated. French forces in Syria and in Africa appeared to be immobilized, yet stood as a threat in the Mediterranean. A small force under General de Gaulle, known as the Free France army, has continued minor engagements allied with British forces in Africa. At the close of 1940, a principal power, France, had been decisively defeated and eliminated as a major force in conduct of warfare in western Europe.

The Italian Army.—Man Power.—Prewar estimates indicate a total strength of 7,000,000 including reserves. Wartime estimates subject to censorship indicate a total man power of about 2,500,000 in service, with a trained reserve potential of close to 5,000,000. The number of divisions in peacetime approximated 50–55. Wartime strength is perhaps 150 divisions. Air forces in peacetime were estimated at around 200,000 men, including reserves. First line craft were assumed to be close to 4,500. The Italian army was distributed about as follows: In North Africa, an army of about 250,000. In Abyssinia, operating against British and French colonies, an army of about 110,000. Italian forces in Albania were estimated at around 100,000. There appeared to be considerable shortages in modern equipment, principally mechanized and in the air arm. Italy appeared to have difficulty in securing adequate stores of raw materials to permit production of modern equipment required to maintain armies in the field.

Theory of Combat.—The Italian theory of combat is the result of World War experience, 1914–18; the successful invasion of Abyssinia; the successful participation in the defeat of France and the invasion of Albania. The theory includes the initiation of attacks from heavily defended bases, with primary reliance on the air arm and the navy. Operations against untrained, poorly equipped troops in Abyssinia and the invasion of Albania were the only campaigns on which an analysis could be based. A review

Above, left: AT THE FIRST ONSLAUGHT of the German invasion, Dutch sappers blew up the bridge over the Maas river at Maastricht, but rubber boats carried nazi troops across the river and enabled them to sustain their attack

Above, right: BRITISH TROOPS practising with "Molotov cocktails" in 1940. These are bottles filled with explosives which are thrown at tanks and armoured cars. Highly effective, they were first used by Spanish Loyalists

of 1940 campaigns indicated that the Italian theory of aggressive air combat has been sorely disproved in combat.

Campaigns—France.—Italy declared war on France June 10, 1940. France requested an armistice from Italy ten days later. During those ten days, Italian air forces made bombing raids and reconnaissance flights in southern and southeastern France. Some mountain troops crossed the French-Italian frontier and were engaged in reconnaissance patrols when the armistice was signed.

Greece.—The Italian invasion of Greece began on the 28th of Oct. 1940. The size of the Italian forces indicated a probable strength of around 150,000. The objective of the Italian army appeared to be bases for operations against the British in the Mediterranean. The theatre of operations included the easily fortified and defended mountain approaches along the Greek-Albanian frontier. Italian activities were confined principally to the slow approach toward the so-called "Metaxas line" in an attempt to take the critical points leading to the main routes into Greece. Italian columns appear to have been lightly equipped in mechanized and armoured units. In the air, Italy had not established air superiority at the close of 1940. The defeat of the Italian columns in western Greece appeared due to inability to maintain uninterrupted advances of men and transportation in the face of stubborn resistance. Reports indicated that security measures were inadequate. Little regard appears to have been given to the effects of weather on such a campaign. At the year's end, the Italians were on the defensive.

Libya.—Italian forces in Libya invaded Egypt on Sept. 12, 1940. The Italian troops moved cautiously along the northern coast in the direction of Sidi Barrani, which was evacuated by the British Sept. 16. All these gains and much more, however, were lost before the end of the year. On Dec. 9 the British, who in the meantime had assembled considerable mechanized equipment, started a counteroffensive which recaptured Sidi Barrani in two days and later swept the Italians out of Egypt. By Dec. 16, with the fall of Fort Capuzzo, the Italians were on the defensive in Libyan territory.

Armies of the Lesser Powers. Denmark.—The Danish army, prior to the outbreak of war in 1939, was a small force of approximately 10,000 with a war potential of no more than 100,000. No resistance was offered to the German invasion and the actual conditions relating to the Danish forces at the close of 1940 were obscured by the censorship of German occupation.

Norway.—Prewar estimates placed the full strength of the Norwegian army at about 15,000 with a war potential of an additional 120,000. The invasion by Germany resulted principally in coastal defence activities and isolated small engagements by independent forces. As in Denmark, the theory of combat was entirely defensive, and following the German victories, information in regard to the Norwegian forces remained unavailable.

The Netherlands.—The Netherlands army was estimated to be approximately 600,000 including reserves, prior to 1940. The invasions in Denmark and Norway and the threat of invasion against Holland resulted in a complete mobilization. On invasion, it was estimated that about 500,000 were in active service. The speed of invasion and the destruction of the main resistance in a period of four days indicated inadequate strength. The theory of combat of the Netherlands army was entirely defensive. Agreements had been reached with Belgium and with the Allies looking toward support against invasion. Dutch air forces were hopelessly inadequate. Great reliance was placed upon border defences and water areas. Stubborn resistance was offered in the initial stages. Dutch forces were well equipped with light weapons considered adequate to defend along the border. The co-ordinated air and ground attack proved too powerful for Dutch defences in open warfare. No anti-mechanized equipment was available against heavily armoured German columns. Anti-aircraft defences were inadequate to overcome German air superiority. The conclusion of the campaign found most of the Dutch troops still intact despite heavy losses in the few major engagements.

Belgium.—The Belgian army was estimated to have prewar strength of about 600,000, not including reserves. Full mobilization of the Belgian forces in the face of German invasion increased this estimate to about 800,000. Air forces were small and ineffectual. The army was well equipped with light weapons and was considered to have organized defensive positions to delay a German advance. Large fortresses were completed and manned. Secondary defences had been constructed and were accessible. The result of the German invasion proved conclusively that the Belgian army had no defence against co-ordinated air and ground attack. The speed of the German advance and the confusion and loss of life created among the civilian population resulted in the ultimate surrender of Belgium. The theory of combat of the Belgian army was entirely defensive. There had been preliminary discussions with Holland, France and Britain looking toward eventual co-operation in the defence of the country.

Greece.—The estimated strength of the Greek army was 150,000, with a potential war reserve increase to about 550,000. The army lacked modern equipment and air forces were practically non-existent. The theory of combat was entirely defensive. The Greek operations against Italy indicated vigorous action of independent units along the Albanian frontier defences. Full information on the size and organization of Greek forces and British aid, was not available.

The Far East. Japan.—In 1940 estimates indicated that the army numbered over 6,000,000, including reserves. Japan employed some 2,000,000 men in China. Japanese forces were relatively well equipped with modern weapons and organized to conduct long range war against Chinese forces. The conduct of operations indicated that Japanese troops were successful in large attacks against organized Chinese forces. However, they had much less success against Chinese guerrilla tactics. The great expanse of country, difficulties of terrain, composition and organization of enemy forces and delays in supply, all contributed toward denying the Japanese decisive victories. The Japanese theory of combat was offensive, capitalizing on a religious personal devotion to the head of the state. Military activities were so closely identified with the extension of political policies that a distinction in a purely military sense is difficult to determine. The Japanese objective appeared to be the conquest of China, and eventual extension of control throughout the south China area. While large areas were occupied, the capitulation of the Chinese government or the destruction of its army was not accomplished.

China.—A conservative 1940 estimate indicated the strength of the armies as approximately 3,000,000, including reserves. The development of guerrilla warfare indicated increases to 5,000,000. In most modern weapons,

including aviation, Chinese forces were inadequately equipped. When equipment was available and opportunities for training permitted, Chinese forces in large numbers fought in major engagements with some success. The theory of combat of the Chinese army was entirely defensive. The Chinese army appeared to be unable to prepare and launch a major attack against Japanese forces. The organization of the army appeared to depend upon availability of supplies of modern weapons, continuity of supplies of manufactured articles of all classes and the creation of a national attitude in regard to the promotion of a military policy. Major Chinese success appeared to be the result of slow-motion guerrilla warfare and the slow attrition of the invading forces.

The United States.—Expansion of national defence programs resulted in an increase in the size of the regular army. The Selective Training and Service Act of 1940, and induction of national guard organizations into federal service for 12-month periods have also added to the numbers in training for the army. The program visualizes a force of around 1,400,000 men and 12,000 aeroplanes available in 1941. Plans also call for the creation of an industrial plant capable of supplying an army of 4,000,000. In 1940, these plans were still in the formative stage, some 400,000 men being in service. Army forces were designated tactically as four field armies, each training in an assigned area of the country. Provision of housing facilities and construction of training camps were undertaken in 1940. The acquisition of additional air and sea base sites in the Atlantic were new responsibilities for the army. The greatest difficulty appeared to be the creation of an industrial plan permitting rapid production of modern arms and other equipment required. National industrial capacity was considered more than adequate to meet the demands of the defence program. The factor of time was, however, the greatest handicap.

Labour adjustments, establishment of priorities in raw materials and considerations for supplying aid to other democracies were additional factors influencing the development of the expansion program.

The defence policy of the United States had expanded to include the adoption of a defence of the western hemisphere. While no information was available as to the manner of implementing this policy, it appeared that the United States had adopted a plan calling for a large and permanent increase in her peacetime strength, and was engaged in a vigorous expansion and training program to prepare armed forces in the event of war. (See DEFENCE, NATIONAL; SELECTIVE SERVICE.)

Conclusion.—At the close of 1940, 13 armies had been engaged in warfare on three continents. The offensive had been undertaken or continued by Germany, Italy, Russia and Japan against Great Britain, France, Denmark, Norway, Holland, Belgium, Finland, Greece, China, Indo-China and Thailand. Six nations had been invaded and defeated, their armies dispersed or held captive by the invader. Russia had overrun Finland and absorbed the small border states of Latvia, Lithuania and Estonia. In addition, Russia had secured nearly one-half of Poland and a considerable portion of her war of 1914-18 losses in Rumania.

Germany had won decisive victories on the western European continent and threatened the security of the British Isles. Italy had begun invasions against Greece and Egypt in the Mediterranean and was engaged in a major struggle with British power in the near east. Earlier alliance with Germany had resulted in a short but satisfactory victory over France.

Japan continued the occupation of a part of China and despite the attrition of a long war, had expanded operations to the south. The end of the conflict of the armies of the world was not in sight. (See also AIR FORCES; CHEMICAL WARFARE; EUROPEAN WAR; MARINE CORPS; MUNITIONS OF WAR; NATIONAL GUARD; NAVIES OF THE WORLD; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR.) (H. A. DR.)

Arsonval, Jacques Arsène d' (1851-1940), French physician, was born in La Porcherie, Haute-Vienne, June 8, studied at the colleges in Limoges and Sainte-Barbe, and received his medical degree in 1877. He devoted himself to the study of heat as a curative agent, using electric current and developing devices to make it effective. His discoveries were not generally utilized until the World War of 1914-18, when the therapeutic value of the electric current was recognized. Dr. Arsonval served for years on the faculty of the Collège de France and when he retired his successor referred to him as "one of the great physicians of our time." His death at his estate near Limoges was announced Dec. 31.

Art Exhibitions. Because of the European war, there was little art activity in the old world and the only important exhibitions were those held in the United States. Cultural understanding among the Americas was furthered by the Art of Argentina at the Virginia Museum of Fine Arts, Latin American Fine Arts at the Riverside museum, and Portinari at New York's Museum of Modern Art and at the Detroit Institute of Arts. Many attractive exhibitions reviewed the art of a period or people, among these three of the year's finest:

the Arts of the Middle Ages at Boston's Museum of Fine Arts; 6,000 Years of Persian Art arranged by the Iranian institute, New York; and the Carnegie institute of Pittsburgh's Survey of American Painting. Pre-Columbian art in the Americas was seen at the Los Angeles and Fogg Art museums; and Four Centuries of Venetian Painting at the Toledo Museum of Art. San Francisco's M. H. de Young Memorial museum presented the admirable Painting of France since the Revolution, sponsored by the French government and shown previously in Buenos Aires and other South American capitals. Other events included Chinese Ceramics at the Cleveland Museum of Art; Chinese Art at the St. Paul gallery, St. Paul; 20 Centuries of Mexican Art at New York's Museum of Modern Art; Northern Painting: 1400-1700 at the William Rockhill Nelson gallery, Kansas City; and at Wildenstein's, the School of Fontainebleau and French Sculpture from the David-Weill collection.

New York's world's fair and San Francisco's Golden Gate exposition again featured old masters and contemporary art. There were the usual annuals and biennials, some regional, some national. There were a number of exhibitions devoted to the work of 20th-century artists, arranged both by museums and dealers: Picasso at the Art Institute of Chicago; Rouault prints and paintings at the Buchholz and Bignou galleries, and most important of all at Boston's Institute of Modern Art (later to the Phillips Memorial gallery, Washington, D.C., and the San Francisco Museum of Art); Frank Lloyd Wright at Boston's Institute of Modern Art and New York's Museum of Modern Art; the late Paul Klee at the Buchholz and Nierendorf galleries; Ozenfant at the Arts Club of Chicago and at the San Francisco Museum of Art; Kokoschka at the Galerie St. Etienne; Epstein at the American Fine Arts galleries; Vlaminck at Wildenstein's; Siqueiros at Pierre Matisse's; Franz Marc at Buchholz'; José de Creeft at Passedoit's; Mahonri Young at the Addison Gallery of American Art and at Kraushaar's; Milles at the Baltimore Museum of Art.

Nineteenth-century art was popular: The Age of Impressionism and Objective Realism was seen at the Detroit Institute of Arts; Eastman Johnson was revived at the Brooklyn museum. Notable 19th-century painters displayed by dealers included Four Great Impressionists and Hodler at Durand-Ruel's.

Among the old masters Jordaens was viewed at the Mortimer Brandt gallery; Poussin and Magnasco at Durlacher Brothers'. Exhibitions organized about a theme included Self-Portraits at the Schaeffer galleries; Ten Pictures in Search of an Author at Mortimer Brandt's; Origins of Modern Art at the Arts Club of Chicago; The Art of the Jeweler at the Metropolitan Museum of Art; The Animal Kingdom at the Morgan library; and Art, Genuine or Counterfeit, at the Fogg museum. The Albright Art gallery, Buffalo, surveyed the Architecture of Buffalo, 1816-1940; the Metropolitan Museum of Art compared Heads in Sculpture. Designs in Glass were seen at Steuben Glass, Inc., and Paintings of London and Paris at Knoedler's and Durand-Ruel's. (D. O.)

Art Galleries and Art Museums. The history of art museums and art galleries for 1940 is one of great contrasts: in Europe it was tragedy and a frantic attempt to save the priceless art treasures of the past from annihilation, while in the U.S. art interest greatly flourished. One-third of the population saw art in museums, community art centres and in both world's fairs, New York and San Francisco. Museums and dealers put on many different exhibitions, from Persian art, through the art of the Middle Ages, to the art of today, which proved the extent of the resources of art in the United States. The art of South America, Central America and Mexico received significant attention throughout

JURY voting on paintings for the Cranbrook-Life exhibition at Bloomfield Hills, Mich., in May 1940. The exhibition was limited to living American artists

the United States. The president proclaimed a National Art Week from Nov. 25 to Dec. 1, to assist artists throughout the country in selling their works. Two of the leading U.S. collectors gave their works to the people: Joseph P. Widener assigned his famous art collection to the nation, through the National Gallery of Art, in memory of his father, the late P. A. B. Widener; and Robert Woods Bliss gave his Dumbarton Oaks estate, land, library, art gallery and contents to Harvard university. In Europe, the art magazines of England carried on magnificently in spite of the war, keeping a steady stream of material printed about art, much as in normal times. The National gallery in London used its air raid shelter for concerts during lunch time; many other museums played a significant role in keeping open whenever possible. Both the British museum and the Tate gallery kept on buying works of art for their collections, in spite of having no place to show them, due to the evacuation of their collections and the bombing of the buildings. In Belgium, Holland and France contemporary art exhibits were on view at the time the nazis marched in and took possession.

JOHN CARROLL'S PAINTINGS were the most successful display at the Detroit Art institute's exhibition in the spring of 1940. In the photograph are his "Moonlight" and "Ena"

The war in Europe so disturbed the world art situation that no one could say definitely in 1940 where masterpieces, loved by millions for centuries, were. According to some accounts the nazis took away the most important works of art from Poland to Germany, as they had from Austria before, to be sold through neutral countries to get foreign exchange for their war machine. The same thing may be true of works of art in Holland, Belgium and France. In Bermuda the British intercepted a shipment of 500 French paintings consigned to a dealer in New York.

Bronze monuments which had no historic or artistic value were melted up in Germany for war purposes. Hitler held a vast exhibit in Munich in the New Crystal palace of his own kind of art, intended to inspire his soldiers and people with a love of the nazi ideal of beauty. Spain, on the other hand, reopened the great Prado museum in Madrid, and it is interesting to note that, due to the great care and vigilance of the guardians of this famous collection, not one important masterpiece was lost during the war in Spain.

During 1940 the art world lost two important European artists: Paul Klee, the Swiss abstract painter, died on June 30 in Berne. Edouard Vuillard, the symbolist French painter, died at La Baule, France, on June 21.

English works of art and important architectural landmarks were damaged by air raids in September. The dome of St. Paul's and that of the University college in London and its library were reported bombed. The Tate gallery lost all its roof and window glass in bombings and the east wall and roof were damaged, but no works of art were hit; 4,000 objects were evacuated in six days; the director and his staff lived in the museum to guard the few objects being shown to the public, so art would not go completely dead despite the rain of death from the sky. The yard of the British museum was struck by a bomb and the glass shattered from the windows; damage to the Wallace Collection building was also reported. The important Gothic cathedral at Coventry was virtually destroyed by bombs. The work of British war artists commissioned by the government was exhibited under the auspices of the ministry of information. In Canada the Montreal Art association opened a new wing to display recent purchases.

The most progressive interest in art was shown in the United States of America during 1940. The New York world's fair showed an interesting exhibit of old-master paintings; works of art done under the Federal Art projects of the Work Projects administration; selections of contemporary U.S. art from each state; in addition to the foreign art exhibits at the fair. In San Francisco, during the fair, several important displays were held; an unusual exhibit of master paintings and drawings of six centuries; selections of contemporary U.S. art from each state and Europe; and art south of the Rio Grande, of Latin America and Mexico. One of the most popular attractions at this fair was "Art in Action," where well known artists worked in a public studio on their designs for painting, sculpture, murals and mosaics. The miniature rooms by Mrs. James Ward Thorne were great attractions at both fairs in 1939 and 1940; her new series of 37 American interiors in miniature, never shown before, were put on display at the Art Institute of Chicago in early December for a six-months period. The Metropolitan Museum of Art selected Francis Henry Taylor as its new director; this museum inaugurated a new lending policy, making available for museums, libraries, schools and colleges U.S. paintings since 1900 not needed for display, the recent accessions in the U.S. field going automatically on this lending list. The Rockefeller Educational grant provided means whereby five leading art museums could study methods to interest students in secondary schools in art: important new material will thus be made available. The University of Chicago and the Art Institute of Chicago were co-

operating on a museum training course for advanced students. The members of the museum course of the Fogg Art museum, Harvard university, assembled an Exhibit of Art: Genuine or Counterfeit, in order to study fakes.

During 1940 a definite emphasis was placed upon American native art and culture and the artistic contribution of the United States was studied in many displays: The Carnegie Institute of Fine Arts showed 160 years of American painting, and Mrs. John D. Rockefeller, Jr., gave her collection of American Folk Art to Williamsburg, Va. The Philadelphia Museum of Art installed a new wing devoted to oriental art. A unique exhibition of French paintings since the Revolution, lent by French museums to South America, was shown in San Francisco, later going to the Metropolitan museum in New York and to the Art Institute of Chicago. Living artists in the U.S.A. participated in the commissions for new murals in public buildings under the treasury department of fine arts; and 82 community art centres throughout the country brought art to localities which had never enjoyed it before.

(L. B. BR.)

Arthritis.

It has been estimated that about one in each 1,000 persons in the United States is affected with "rheumatism and allied diseases" on any one given day and that there were about 6,850,000 cases of "rheumatism" in the United States in 1937.

The spontaneous polyarthritis in the rats of Java, which was discovered several years ago, represents a disease closely similar to a common form of human arthritis. The rat disease has, however, been definitely traced to a pleuropneumonia-like organism. Sulphanilamide and its derivatives have been tried but have not proved generally effective. Some investigators have reported good results with gold preparations. Up to the present it does not seem that this spontaneous rat arthritis will elucidate the problems of arthritis in man as much as was originally anticipated. Continued studies of the immunology of arthritis have been made involving particularly the agglutination reaction. Thus Bunim and McEwen found that three-quarters of their patients with rheumatic polyarthritis showed an abnormally high agglutination titer (anti-streptolysin) and those with other forms of joint diseases did not. This result cannot be interpreted as proof of a streptococcus causation, but the test has been described as helpful in diagnosis. Previous observations that the blood of patients with rheumatoid arthritis was abnormally low in vitamin C content have been confirmed and it has been demonstrated that such patients have a high tolerance for vitamin C. Even when administered in large quantities, however, no improvement could be attributed to the effect of the vitamin, perhaps indicating that this finding is an effect rather than a causative factor. No new important developments in treatment occurred in 1940. Colloidal sulphur, vaccine therapy, fever therapy and gold salts have received the greater amount of attention. Carefully controlled experiments on sulphur metabolism tend strongly to discourage the use of sulphur preparations for arthritis. Reports of the use of vaccines in general proved no more favourable than in preceding years. Fever therapy (the artificial production of high temperatures in the body) is not a new form of treatment but when carefully administered in selected cases sometimes gives encouraging results. Gold salts in the hands of some investigators appear to give favourable results, although the toxic effects may be serious and the exact types of arthritis in which they may be effective have not been defined. Pending further studies the use of gold salts must be considered dangerous and experimental and should be used only by experienced clinical investigators who are aware of all the possibilities.

More or less favourable results in the treatment of arthritis

have been reported from the use of activated ergosterol and of some oestrogenic substances. Some workers in the field have employed local anaesthetics by injection in order to control the intractable pain present in some forms of arthritis and related conditions. There is, however, a considerable difference in opinion as to the safety of this procedure and even more as to the durability of the relief of pain following local anaesthesia.

Art Institute of Chicago: see ART GALLERIES AND ART MUSEUMS.

Art Sales. The principal New York city auction gallery, Parke-Bernet, held 84 public sales of art and literary property during the 1940 season; it announced total sales amounting to \$2,329,330. The Plaza Art galleries also held 84 sales during the season and reached a sales total of \$1,008,564. Despite the European war, sales in nearly every case resulted in their estimated values and in some instances in excess of advance figures. The Clendenin J. Ryan collection, the most important print collection ever offered for public sale in the United States, was auctioned off by Parke-Bernet. Six masters were represented: Schongauer, Dürer, Van Dyck, Rembrandt, Meryon and Zorn. One of the most dramatic events in auction-room history took place when the famous set of 20 etched portraits by Van Dyck was up for sale, and \$28,000 was offered for the lot. Then the auctioneer accepted bids on each portrait separately, and on this basis they were acquired by individuals in sharp competition for a total of \$40,500. British 18th century paintings and sporting prints and 36 Gothic and Renaissance paintings were also included in the Ryan sale. Two bronzes from the collection entered American museums: the "St. Sebastian" by Alessandro Vittorino was acquired by the Metropolitan for \$500; "Architecture," a female allegorical nude by Gian Bologna, was bought by Boston for \$2,200. Another important sale was that of the Untermeyer collection, when \$18,000 was obtained for Rubens' "A Feast of the River Gods," and \$11,750 for a Cellini bronze, "Jupiter." A rising market for Colonial and Middle American art was predicted. The best price ever paid for a Lincoln portrait was obtained for Thomas Hicks's "Lincoln," dated 1860, in the Mrs. Herbert Shipman collection. It was acquired by Kennedy and company for \$11,000.

A National Art Week was created to stimulate art sales in the United States. In Washington, D.C., \$9,621 worth of art was sold during the week; southern California reported a total of \$7,772; Chicago, a total of \$4,772; and Greater New York, \$5,845.

England.—Surprisingly enough, London's auction season was lively, with prices holding up. At Sotheby's in May, the sale of the famous Eumorfopoulos collection of Chinese ceramics reached a total of £25,935, which exceeded the expectations of the experts. A Red Cross sale at Christie's in July brought £84,037.

(D. O.)

Asbestos. World production of asbestos increased to a new high record of over 600,000 metric tons in 1937, declined sharply in 1938, but rose again in 1939. Asbestos is largely of British origin, since 90% of the 1929 output and 77%

of that of 1937 was mined in the British empire. In 1937 Canada supplied 61% of the world total, Southern Rhodesia 9%, South Africa 4% and Cyprus 2%; the only large producer outside the British empire was the soviet union, with 20% of the 1937 total, increased from 7% in 1929. The United States consumes about one-half of the world supply but has only a minor output, which, however, has increased nearly fourfold during the past few years, reaching 15,100 short tons in 1937. United States imports decreased from 307,200 short tons in 1937 to 179,500 tons in 1938, but rose to 242,600 tons in 1939. Preliminary estimates for 1940 indicate that Rhodesia will remain at about the 52,900 metric tons reported in 1939, Canada will show a small increase over 330,600 tons in 1939, while South Africa will have an increase of possibly one-quarter over the 20,000 tons in 1939. (G. A. Ro.)

Ashbrook, William Albert (1867-1940), U.S. representative in congress from the 17th Ohio district, credited with sponsoring more pension bills for soldiers than any other representative, was born on his father's farm at Johnstown, Ohio, July 1. After attending the public schools he worked in a printing office and at the age of 18 became the owner and editor of the *Johnstown Independent*, a weekly newspaper. Five years later he was appointed postmaster. He was a member of the Ohio legislature in 1905-06, but resigned when he was elected to congress, serving in that body for 20 years. At one time he was the only Democrat in the Ohio delegation. He served four years as secretary of the National Editorial Association. He died at Johnstown, Jan. 1.

Asphalt. More than half of the world supply of native asphalt comes from the famous asphalt lake of Trinidad; the bulk of the remainder is divided between Egypt and the United States, with possibly 10% distributed among several minor producers. A number of countries, with the United States in the lead, produce considerable quantities of asphaltic or bituminous rock, carrying usually less than 10% of true asphalt. The largest item, however, is petroleum asphalt, of which there was produced in the United States in 1939 some 5,988,000 short tons, 78% from domestic petroleum, and 22% from foreign. As compared with this, the domestic production of bituminous rock was 422,500 tons, and native asphalts only 37,400 tons. Production in Trinidad declined from 219,600 long tons in 1929 to 92,800 tons in 1934, recovered to 145,900 tons in 1937 and was 130,300 tons in 1939. (G. A. Ro.)

Assassinations. The assassinations of 1940, actual or attempted, included the following:

Jan. 22 Baghdad, Iraq. Seyyid Rustum Haider, minister of finance, who was shot by a dismissed police inspector Jan. 18, died of his wounds.

March 1 Havana, Cuba. Orestes Ferrara, former sec'y of state, was shot and dangerously wounded by unknown assailants.

March 13 London. Sir Michael O'Dwyer, retired Indian administrator, was fatally shot by Mahomed Singh Azad, an East Indian, at a public meeting. Azad also wounded Lord Zetland, sec'y of state for India, Sir Louis Dane and Lord Lamington, both former British administrators in India.

DEATHBED of Lev Trotsky, Aug. 21, 1940, in a Mexico City hospital. His assassin, according to Trotsky's associates, was an agent of the Russian OGPU

- April 5 London. Judge Edwin Cooper Burgis, chairman of the British tribunal for conscientious objectors, was seriously wounded by an assailant who stabbed him six times in the back.
- July 19 Shanghai. Samuel H. Chang, director of the U.S.-owned *Post Mercury* company and two Chinese newspapers, was assassinated by a gunman in the International settlement.
- Aug. 20 Mexico City. Lev Davidovich (Leon) Trotsky, Russian politician who fled from Russia and ultimately took refuge in Mexico, was fatally attacked by a man whom he described as an agent of the Russian OGPU. The assassin gave his name as Frank Jackson but was identified as Jacques M. van den Dreschd. Trotsky died of his injuries the next day. A previous attempt to assassinate him had been made May 24.
- Sept. 7 Timisoara, Rumania. An attempt was made to assassinate ex-King Carol of Rumania as he was fleeing by train from Bucharest to Switzerland.
- Oct. 11 Shanghai. Fu Hsiao-en, Japan's puppet mayor of the city, was assassinated while asleep in his home.
- Nov. 27 Rumania. Members of the Iron Guard broke into the Jihlava military prison and killed 64 former high officials who had served under ex-King Carol.
- Nov. 28 Bucharest, Rumania. Nicolas Jorga, former premier of Rumania, was assassinated as the Iron Guard continued the "purge" of its enemies.
- Nov. 28 Havana, Cuba. Raul Fernandez Fiallo, professor in the University of Havana, was assassinated by unidentified assailants near the university grounds.

Astronomy. Two new instruments, a 24-inch reflector and a 70-foot tower telescope, were placed in operation at the McMath-Hulbert observatory during 1940. The addition of these new instruments makes possible the simultaneous observation of solar prominence motions in three dimensions and measurements of the energy output involved. These additional facilities and unique observational techniques already developed at

this observatory place it in the front rank of the world's solar observatories.

A new high-altitude station for solar observation was established in Colorado by the Harvard college observatory. This new station is equipped with a coronagraph of design similar to that devised by Lyot and the altitude of over 11,000 feet should provide the observers with exceptionally fine atmospheric conditions.

Solar System.—The Sun.—Among the data needed for an understanding of the physical conditions existing in the sun is an accurate determination of the solar spectral-energy curve. Using a double quartz monochromator, Pettit has investigated the spectral-energy curve in the ultraviolet. After allowing for the effect of the earth's atmosphere and for the absorption of the Fraunhofer lines, as far as that was possible, he found the resulting observed energy curve to be quite different from that of an ideal black body. The very great difficulty of allowing adequately for the effects of the absorption lines, due to insufficient resolution, probably accounts for much of the discrepancy.

Areal and photometric observations of solar eruptions made by Giovanelli at the Commonwealth Solar observatory show that approximately 20% of these eruptions eject eruptive prominences. Giovanelli suggests the hypothesis that the constant velocities of these prominences, first pointed out by Pettit, are maintained by radiation pressure of the Lyman alpha line of hydrogen and that the changes of velocity may originate in magnetic fields.

Planetary System.—Of the five comets discovered during 1940, two were previously known periodic comets which were rediscovered, whereas the remaining three were new objects. The most interesting of these was discovered by Cunningham on plates taken at the Harvard observatory. Comet Cunningham reached naked-eye brightness during the last month of the year before disappearing from the view of northern observers.

Observations of meteors at various times of year showed indication of a seasonal variation in height. Using data from all available published real paths of meteors, exclusive of shower meteors, McIntosh showed that there exists a well marked seasonal variation in height for the sporadic meteors. He found the amplitude of variation to be greatest at the lower levels in the atmosphere, and also that a similar seasonal variation exists in the width of the meteor zone. These results indicate that the cause of the variation in height lies in the atmosphere itself, the greater height occurring in summer due to heating and expansion of the atmosphere.

The question whether fireballs have been members of our solar system or have come from interstellar space is of importance to astronomers. A study by Wylie of the Pultusk fall of meteorites of Jan. 30, 1868, is of particular interest in this connection. Galle, the discoverer of Neptune, published a rather extensive discussion of the orbit of this meteorite in 1868 and concluded that the velocity was hyperbolic, *i.e.*, that the meteorite came from interstellar space. Wylie's study indicated that with one exception Galle's figures for this meteor should be approximately correct. The exception is that the adopted height of appearance of the meteor is far too great. Modern measures indicate that, even for fireballs which vary greatly in size and brightness, there is little variation in the height of appearance. Investigations by Wylie and by Watson indicated a tendency for astronomers to place the height of appearance of a meteor far too high when depending solely on reports of the general public. Wylie adopted a height of appearance for the Pultusk meteor based on modern measures and found that when this was done the meteor proved to be a regular member of our solar system. The new orbit shows a semi-major axis one and three-quarters that of the earth's orbit, an eccentricity of 0.45 and a period of 2.37 years. It

would appear that the number of meteors having hyperbolic velocities may not be nearly as large as previously predicted by Opik and others.

The possibility of the existence of formaldehyde gas in the atmosphere of Venus was investigated by Wildt. Ultraviolet spectrograms of Venus show no trace of formaldehyde bands. Nevertheless Wildt suggested that a tenuous primordial atmosphere of water vapour and carbon dioxide would afford suitable conditions for the photochemical synthesis of formaldehyde. In a moist atmosphere formaldehyde, (CH_2O) , would rapidly polymerize into a mixture of polyoxymethylene hydrates, $(\text{CH}_2\text{O})_x \cdot \text{H}_2\text{O}$, which is a white crystalline solid. Wildt suggested that, since the atmosphere is free from water vapour, the very dense clouds observed may be constituted of solid polyoxymethylene hydrates. This conclusion is of particular interest in view of the suggestion of observers at the Lowell observatory that the brightness of the halo about Venus, when it is nearly between us and the sun, could be caused by scattered "dust" particles in the planetary atmosphere.

Recent measurements of the total radiation emitted by gaseous carbon dioxide have been made by Dreisch and by Eckert. Using these measures, Wildt calculated the upper limit to the greenhouse effect produced by the carbon dioxide in the atmosphere of Venus. He concluded that the temperature of the sub-solar point is between 93°C . and 135°C ., and probably nearer the higher value. It appears, at least, that the surface temperature of Venus is somewhat above the terrestrial boiling point of water.

New radiation measurements of the eclipsed moon were made by Pettit with a 20-inch telescope of 40 inches focal length. Both a cover glass and a water cell were used to determine temperature. For a point near the centre of the disk the temperature dropped from 371°K . to 200°K . during the partial phase and then slowly dropped to 175°K . during totality. The rate of radiation was observed to be nearly proportional to the energy received except at the lowest temperatures. Pettit found that an equivalent thickness of the radiating layer of approximately one inch will satisfy the conditions, which means that the moon's surface must be covered by some loose agglomerate such as pumice or volcanic ash.

It has long been known that the brightness of Eros varied in a period of about five hours. Jones made a thorough investigation of the possibility of short-period variations in the orbital path, based on a large number of observations from various observatories. Contrary to the conclusions of Vick, reached from a study of very limited data, Jones found no evidence whatever of such short-period variations in the position of Eros and concludes that this interesting asteroid is an entirely suitable object for the determination of the solar parallax.

Stars.—Special Stars and Stellar Structures.—Differences of colour among stars of a given spectral type have long been puzzling and have been attributed either to differential absorption in space or to the effect of luminosity. If attention be confined to stars which are at the same distance and in the same direction, for example those in galactic clusters, the effect of differential absorption can be eliminated. Such an investigation was undertaken by Hunter and Martin, who found that the dispersion of colour in any one spectral type is greater than can be explained by observational error and hence is of physical origin. They found, however, no significant correlation between this dispersion and luminosity.

Stars of a close binary system, such as short-period eclipsing stars, are known to have a more or less ellipsoidal figure. It has been pointed out by Takeda, Chandrasekhar and others that

FULL ANNULAR ECLIPSE of sun at 5:07 P.M., April 7, 1940, photographed at Green Cove Springs, Fla., by D. Franklyn Yerex

these elongated stars must have an unequal distribution of light over their surfaces due to a gravity effect. A preliminary investigation of the effect of this unequal distribution on light-curves of eclipsing pairs was made by Sitterly, who found that the effect is readily observable for very close pairs and will occasion alteration of the photometric elements. This unequal distribution of brightness over the star's surface might also be expected to affect spectroscopic observations of such a close pair. Indeed Sterne found that if allowance is made for such distribution of brightness the anomalous eccentricities obtained from spectrographic observations are explained and complete agreement between spectrographic and photometric results is obtained.

New evidence from laboratory experiments concerning the carbon cycle which Bethe proposed as a source of stellar energy provided improved estimates of the probabilities of the related nuclear reactions. Bethe concluded that the lifetimes of C^{12} and N^{14} are almost equal and hence that C^{12} and N^{14} should be about equally abundant in stars of the main sequence, which agrees with astrophysical evidence. The total time necessary to complete the cycle is estimated to be 6×10^6 years, so that a combined abundance of C and N only one-tenth that previously assumed will produce the same energy evolution. This value is in better agreement with astrophysical data.

An exceedingly extensive investigation of the masses of the stars by Russell and Miss Moore was published during 1940. All visual, spectroscopic and eclipsing binaries for which sufficient observational data are available have been included in this study. One of the principal results of this investigation is the conclusion that a simple linear relation between masses and luminosities of stars is of very general application.

A catalogue of new dynamical parallaxes of 2,529 stars results from the investigation.

Stellar System.—Contributions to systematic astronomy include the eleventh list of trigonometric parallaxes determined at the Cape of Good Hope and the parallaxes of 26 stars by van Maanen. Systematic and accidental errors of spectroscopic parallaxes were investigated by Russell and Miss Moore. Deviations from linear correlation between mean reduced spectroscopic and trigonometric parallaxes of 1,140 stars were found to be no larger than could be attributed to accidental and sampling errors. The authors concluded that differences in the relative abundance of hydrogen and heavy elements, and differences in the contribution of negative ions to general opacity account for most of the apparent errors of spectroscopic parallaxes. After appropriate corrections are applied, the probable error of a corrected spectroscopic parallax is found to be $\pm 21\%$ for stars of the main sequence and $\pm 16\%$ for giants.

From a study of selective absorption based on the colours of 1,332 B-type stars observed with a photoelectric photometer, Stebbins, Huffer and Whitford found a median value for the absorption coefficient in photographic light of 1.1 magnitudes per kiloparsec. Their study showed clearly, however, that in the first 2,000 parsecs from the sun the absorption of interstellar material near the galactic plane is much too irregular to be adequately represented by a mean absorption coefficient.

External Galaxies.—Among the numerous studies of spiral nebulae during the past few years little has been done on the colour of these objects. Of particular interest, therefore, are observations of seven spiral nebulae by Seyfert with red- and blue-sensitive plates. He found that these nebulae seem to have a general background intensity which decreases uniformly outward from the nucleus and has the same colour. The spiral arms, however, and the nebulous condensations in them have a red index of 0.0 magnitude, thus making them considerably bluer than the nucleus. (See also TELESCOPES.)

Athlone, 1st Earl of (ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE CAMBRIDGE) (1874–), British statesman, was born April 14 at Kensington palace, the third son of the 1st duke of Teck. Educated at Eton and the royal military college, Sandhurst, he served in Matabeleland, Southern Rhodesia, in 1896 and saw action during the Boer war, receiving the Queen's medal with five clasps. During the World War of 1914–18 he was mentioned twice in dispatches, and in 1917 he was created 1st earl of Athlone. He was governor general of the Union of South Africa from 1923 to 1931. In 1931 he was made governor of Windsor castle, in 1932 chancellor of London university and in 1936 grand master of the Order of St. Michael and St. George. In the latter year he was also appointed personal aide-de-camp to the king.

He was appointed 16th governor general of Canada April 3, 1940, to succeed the late Lord Tweedsmuir (*q.v.*). Arriving in Halifax June 19, he was inducted two days later. On July 17, in his first public address as governor general, he pleaded for unity throughout the British empire. An important diplomatic event of his first year in Canada was his visit with his wife, Princess Alice, and official family to President Roosevelt at Hyde Park in October.

Atom: see CHEMISTRY; MATTER, STRUCTURE OF; PHYSICS.

Audiometer: see DEAFNESS.

Australia, Commonwealth of, a self-governing member of the British commonwealth of nations, situated in the southern hemisphere between longitudes $113^{\circ}9'$ E. and $153^{\circ}39'$ E. and latitudes $10^{\circ}41'$ S. and $43^{\circ}39'$ S.; national flag, a blue ensign, with the Union flag in the quarter and six white stars in the field. Ruler, King George VI; governor general, the Rt. Hon. Lord Gowrie, V.C.; premier, R. G. Menzies; language, English; religion, Christian (census 1933: Anglican, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist 684,022; other Christians, 603,914).

Area and Population.—Area, 2,974,581 sq.mi.; population (est. Dec. 31, 1939), 6,997,326. Chief towns (pop. Dec. 31, 1939): Sydney (1,302,890), Melbourne (1,046,750), Adelaide (322,990), Brisbane (326,000), Perth (224,800), Hobart (65,450), Newcastle (115,660). Capital, Canberra.

History.—R. G. Menzies continued at the head of a minority government composed exclusively of members of the United Australia party until March 1940. In spite of the determination of all parties to support measures for the vigorous prosecution of the war, the task of the government was not an easy one. The defeat of the government candidate at the by-election, occasioned by the resignation of R. G. Casey to take up his appointment as Australian minister to Washington, added to their embarrassment. Negotiations between the prime minister and A. G. Cameron, leader of the Country party, resulted in the formation on March 14 of a coalition government in which the Country party received three portfolios and two assistant ministerial posts.

On June 25 the house of representatives passed the National Security bill by 60 votes to 10, and on the following day it passed through all the stages in the senate. The principal provision of this act empowers the governor general to make regulations which require persons to place themselves, their services and their property at the disposal of the commonwealth, as appear to him to be necessary or expedient for securing the public safety,

the defence of the commonwealth or the efficient prosecution of any war in which the king is, or may be, engaged. The only limitation on the powers conferred by the act is that no regulation may be made which will authorize any form of compulsory service beyond the limits of Australia and its territories.

In July Mr. Menzies offered the opposition five or possibly six seats in the cabinet if a national government were formed. He also announced that the cabinet would ask powers to extend, if necessary, its term of office which was due to expire on Nov. 28. To give parliament the powers proposed, a resolution would have to be passed by both houses of the federal parliament and be confirmed by legislation through both houses of the British parliament. Neither of these proposals was acceptable to the Labour party and the prime minister decided that the federal election should be held on Sept. 21. A bill was passed to enable the Australian fighting forces overseas to vote.

The result of the general election was that the government majority was reduced to one in the house of representatives and two in the senate. Negotiations for the formation of a national government again failed, but labour agreed to the establishment of a war council composed of four members of the government and four members of the labour opposition with the prime minister as chairman.

Brigadier Street, minister for the army; Sir Henry Gullett, vice-president of the executive council; J. V. Fairbairn, minister for air; General Sir Brudenel White, chief of the Australian general staff and six others were killed when the plane in which they were travelling to Canberra crashed within a mile of its destination on Aug. 13.

The census which should have been held on June 30 was postponed in consequence of the war.

External Affairs.—Australian representation abroad was strengthened during 1940 by the appointment of R. G. Casey as minister to Washington and Sir John Greig Latham as minister to Tokyo. Sir Thomas William Glasgow was appointed high commissioner to Canada.

Sir Walter Massy-Greene led the Australian delegation to the eastern group conference which met on Oct. 25 at Delhi to consider production and supply questions associated with the empire's war effort.

War Measures.—In addition to the ships of the royal Australian navy in commission at the outbreak of war, five ships were armed as merchant cruisers, 30 as war auxiliary vessels and more than 150 merchant ships were defensively equipped. An intensive program of naval construction within the commonwealth was planned and two vessels were completed. A further ten vessels were in course of construction, including destroyers and patrol vessels. A widespread system of organization was developed for the provision of fuel and stores at strategic points. Victualling stores for the use of the royal navy, the Australian Imperial force abroad and the Indian army were sent overseas. Little detailed information of the work of the navy was likely to be revealed until after the war, but the admiralty announced that H.M.A.S. "Sydney" sank the modern Italian cruiser "Bartolomeo Colleoni" by gunfire during an action in the Mediterranean and that an Australian destroyer had sunk an Italian submarine, also in the Mediterranean.

The policy of the government was that no limit should be set as to the number of volunteers for overseas service with the Australian Imperial force. The speed at which such recruits could be accepted must be governed by the output of modern military equipment and the facilities which could be provided for their training. These factors had to be considered in conjunction with the organization of an adequate force for home defence. By June 30, 22 A.I.F. camps and 36 militia camps had been established. The strength of the A.I.F. was 89,556; the permanent military

forces 18,398; and the militia 76,230. Part of the A.I.F. had been sent overseas and this force was to be increased to a complete corps of four divisions. A home defence volunteer force of 30,000 was being trained and further drafts of universal trainees were to be called up under a plan which provided that a land force of 250,000 should be maintained in Australia for home defence.

One squadron of the royal Australian air force was attached to the coastal command in the United Kingdom and three squadrons were serving overseas in the far east. Under the development program the number of military aircraft in Australia was doubled and a corresponding increase in personnel had taken place.

Australia is one of four partners in the Empire air training scheme. The organization necessary for the production of the number of air crews fixed as Australia's quota under the agreement made at Ottawa was ahead of schedule. Training establishments to be formed or reorganized to meet the requirements of this scheme consisted of 13 elementary training schools; eight service flying schools; three initial training schools; four air observers' schools; four wireless air gunners' schools; four bombing and gunnery schools; and three air navigation schools. The number of volunteers for the R.A.A.F. and the empire scheme totalled 132,000, of whom 32,000 had been accepted.

A ministry of munitions was set up with Mr. Menzies as the minister in charge. The direction of the new department was entrusted to a panel of industrial and business executives of outstanding ability with Essington Lewis as director-general. By June 25 new munition annexes had been established, most of which were in production before the end of 1940. The total number of employees engaged in munition production at government factories and munition annexes was 15,200 and it was planned that a further 65,000 would be engaged within 12 months, in addition to about 70,000 men who would be working on the production of materials for munitions making.

Public Finance and Economic Affairs.—Federal revenue for 1939-40 amounted to £111,913,421 and the excess of receipts over expenditure was £2,928,566 after charging an additional £9,000,000 for defence purposes against revenue. Total defence and war expenditure for the year was £55,200,000 of which £24,300,000 was charged against revenue and the balance of £30,900,000 against other funds, including loans. The excess of receipts was appropriated for war purposes.

The outbreak of war in 1939 occurred when Australia was experiencing a mild recession. As a result of a long period of falling prices, business activity had declined. Investment had fallen away, the liquidity of the banks was very low and the state of London funds was causing anxiety. When, in Nov. 1939, Mr. Spender, the acting treasurer, introduced the first post-war supplementary financial statement dealing chiefly with the proposals for increased war expenditure, the government policy was to postpone full war-time taxation until the economic position had improved to the desired degree.

As a consequence of this policy employment rose steadily during the early months of 1940, and labour was absorbed in war industries without robbing other productive activities of their finance or their labour. At the same time favourable conditions in the primary industries resulted in a large increase in volume of export productions and export prices rose by about 20% above the level of the previous export season. National income rose and it is officially estimated that for the year 1939-40 the total national income was £866,000,000 or nearly £100,000,000 greater than the previous record established in 1929. The liquidity of the banking system improved and interest rates on all classes of securities showed a downward tendency.

On May 2 the treasurer, Mr. Spender, laid before the house his taxation proposals for the fiscal year 1940-41. This action was

unprecedented in the financial history of the commonwealth, for two months of the current fiscal year 1939-40 had yet to run. He announced that the commonwealth's economic and financial position had improved to such an extent that it was expedient to shift the emphasis of the government's financial program away from borrowing from the banking system and throw it substantially on to taxation and loans from the market. It was estimated that war expenditure within the commonwealth would be £79,000,000 in 1940-41 and that existing taxation would yield only £16,000,000. Under the current program a further £7,000,000 had to be found for the fiscal year 1939-40. This meant that a total of £70,000,000 additional funds had to be raised and he proposed that £20,000,000 should be provided by additional taxation and that £50,000,000 should be raised by public borrowing in Australia. Taxation was increased over a wide field, £10,300,000 by indirect and £9,700,000 by direct taxes. The total war expenditure in Australia and overseas was estimated at £110,000,000 and of this sum the budget provided a contribution of £36,000,000 or approximately one-third.

Since these financial proposals were laid before the house, progressive revisions of the war program entailed increased financial commitments and the revised estimate of war expenditure for the fiscal year 1940-41 amounted to £177,000,000—£145,000,000 within the commonwealth and £32,000,000 to be spent overseas.

The first war loan of £18,000,000 in February was fully subscribed and a further loan of £20,000,000 offered to the public in June was oversubscribed.

War savings certificates were placed on sale on March 18, and it was hoped that the public would subscribe £10,000,000 by the end of the year; by mid-October £14,000,000 worth of certificates had been sold.

Overseas trading statistics for 1939-40 record that imports and exports of merchandise practically balanced, the respective totals being £144,900,000 and £145,600,000. Information regarding movement of gold was not published, but it was estimated that production during 1940 was in the vicinity of £17,500,000. The service of government and semi-government debts overseas cost about £28,000,000, leaving a deficiency of £10,000,000 on "visible" items which was to be met by capital movements or by a depletion of London funds.

Education.—In 1937: state schools, 10,205; average attendance, 768,848; private schools, 1,880; average attendance, 210,101; technical education, net enrolments, 102,496; business colleges, average attendance, 21,139; universities, number of students, 11,098. (See also EDUCATION: *British Empire*.)

Banking and Finance.—Revenue (actual 1939-40), £A111,914,000; (est. 1940-41) £A150,100,000; expenditure (actual 1939-40), £A108,986,000; ordinary (est. 1940-41), £A95,073,000; defence, £A65,000,000; public debt (June 30, 1940), £A1,321,793,028; notes issued (June 24, 1940), £A60,875,000; gold and sterling reserve (June 24, 1940), £A16,082,000; exchange rate, £A125=£100 sterling.

Trade and Communication.—Overseas trade 1939-40 (merchandise): imports, £A144,921,000; exports, £A145,589,000; (bullion and specie 1938-39): imports, £A3,562,000; exports, £A18,963,000. Communications and transport: 1939, roads, total mileage, c. 500,000; metalled, c. 200,000mi.; railways open to traffic, 27,961mi.; airways (1938-39), distance flown, 14,098,615 mi.; passengers carried, 147,919; goods carried, 1,734,644lb.; mails carried, 740,375lb.; shipping with cargo and in ballast, in net tons, entered (monthly average 1938-39), 558,000; (monthly average 1939-40), 508,000; cleared (monthly average 1938-39), 553,000; (monthly average 1939-40) 502,000; motor vehicle registrations (Aug. 31, 1940): cars, 557,780; commercial vehicles, 263,404; cycles, 74,445; wireless receiving set licences, 1,212,260;

telephones, number of lines, 506,612.

Agriculture, Manufactures, Mineral Production.—Production (in metric tons): wheat (1939-40), 5,719,600; gold (1939), 51,187 kilograms; wool (1939), 446,100; cane sugar (1939-40), 943,000; coal (1939), 12,438,000; lignite (1939), 3,720,000; iron ore (metal content) (1938), 2,287,000; pig iron and ferro-alloys (1938), 945,000; wine (1938-39), 680,000 hectolitres; oats (1938-39), 282,000; barley (1938-39), 245,000; maize (1938-39), 179,000; potatoes (1938-39), 278,000; butter (1938-39), 206,800; lead (smelter production) (1939), 185,000; zinc (smelter production) (1938), 70,000; copper (smelter production) (1938), 17,400; tungsten ore (1938), 540; antimony ore (1938), 900; silver (1939), 385. Labour and employment: employment in factories (1928-29=100) Aug. 1940, 120.2; number (average Aug. 1940), 562,500; unemployment, Trade Union returns (May 1940), 10.5%; recorded material production (1938-39), £A464,993,000. Automobile Racing. The victory of Wilbur Shaw in the annual 500-mi. Indianapolis auto racing classic on Memorial day transcended in importance all other features of the speed kings during 1940. Shaw became the first man in the 28 year history of the event to win two years in succession.

Competing before 142,000 spectators, Shaw completed the distance in 4 hr. 22 min. 31.16 sec. But his average of 114.277 m.p.h., resulting in a large degree from the decreased pace ordered at the 375-mi. mark, was considerably below the record figure of 117.200 m.p.h. of the late Floyd Roberts in 1938.

Rex Mays, who finished two and a half miles behind Shaw, was the runner-up, with third place being annexed by Mauri Rose of Columbus, O. The 825 tallies thus credited to Mays helped the Californian capture the American Automobile association national point championship for 1940. Victories later in the campaign at Springfield, Ill. and Syracuse, N.Y., boosted his total to 1,225. In the point tabulation, Shaw took second place, having received 1,000 points for his Memorial day triumph. Rose took third in standing with 675, Ted Horn of Hawthorne, N.J., fourth with 625. Late in July 1940, Ab Jenkins, six-foot mayor of Salt Lake City, participated in a 24-hr. endurance race on the Bonneville salt flats in Utah. He broke 21 world marks while completing his sweep of all the land speed records from 50km. to 3,000mi. and from 1 hour to 24. The car thundered a total of 3,868.32mi. over the saline race courses and averaged 161.18 m.p.h. for the entire period. This was nearly four miles faster than the world standard of 151.27mi. Jenkins had set in 1939.

Leading virtually from start to finish, George C. Rand of New York won the second annual Montauk (L.I.) Grand Prix road race.

Midget Automobile Racing.—One of 1940's high lights was the 100-mi. national A.A.A. title event at Langhorne, Pa. The winner was Joe Garson of Great Neck, N.Y., who led Chet Gibbons of Paterson, N.J., by a quarter of a mile at the finish. Garson ranked fourth in the season's final point standing of drivers on the eastern midget racing loop. He was credited with 2,923 tallies on the list announced by the A.A.A. contest board. The roster was headed by Charles Miller of Linden, N.J., with 4,497½. (T. J. D.)

RETRACTABLE INSTRUMENT LANDING ANTENNA, installed on many planes in 1940. Photograph at left shows antenna retracted; at right, in position for landing. This device decreases wind resistance and prevents formation of ice on the antenna

Aviation, Civil. In a world at war, civil aviation must be content with second place. In nearly every country, even those not in the war, military activities dominated the aviation scene in 1940. In the European countries at war, private flying ceased altogether. The only civil aviation carried on in Europe, as well as in China and Japan, was that of government-subsidized air lines.

Transport.—On the outbreak of the war in the fall of 1939, all commercial air lines in Europe discontinued their service outside their own boundaries, but within a short time adjustments had been made to war conditions and many international routes were being flown as before. Until the fall of France, service between London and Paris was continued by British Overseas airways and Air France. Middle Europe was connected by nearly a dozen air lines. The British air line and the Dutch-owned K.L.M. system continued to fly their international routes to the far east. When the Germans occupied Holland and France, both Air France and K.L.M. services operating from continental bases were disbanded. Both lines lost valuable equipment to the Germans.

By the fall of 1940, a number of schedules were being flown regularly. Most active line was the German Deutsche Lufthansa, which was flying from Berlin to Oslo, Stockholm, Moscow, Lisbon, Rome, Bucharest and many German cities. Air lines from Russia, Hungary, Italy, Spain, Sweden, Denmark, Finland, Portugal and Switzerland were in operation. The British Overseas Airways was flying regularly to Lisbon, which airport was fast becoming the most famous international transfer spot in the world as British, Italian, Swiss and German lines flew there to transfer passengers to Pan American's Atlantic service.

K.L.M.'s services in the West Indies and that of its associated company in the Dutch East Indies were continued.

Most aggressive, as well as most spectacular, air line in international transport circles was Pan American airways. Flying more than 69,564 mi. of routes and connecting some 53 countries and colonies, this line reached an all-time high in volume of business in 1940. Its ships flew 17,000,000 mi. and carried 275,000 revenue passengers a total of 140,000,000 mi. In 1939, it had established the first passenger service by aeroplane across the Atlantic. With the coming of war in Europe, demand for air transportation reached such a point that more passengers were rejected than could be accepted, due to lack of facilities. Flying three Boeing "clippers"—huge flying boats—the air line provided three round-trips weekly between New York and Lisbon. Because of its speed and dependability, this route became the

most important means for carrying both U.S. government personnel and documents to and from Europe. By the end of 1940, nearly 300 crossings had been made. Plans for 1941 include a change of routes. Instead of stopping at Horta where the harbour is not protected from rough seas, P.A.A. plans to fly nonstop to Lisbon from New York. The return trip will be down the west coast of Africa to Bolama in Portuguese Guinea, then to Port of Spain, Trinidad, and up to Puerto Rico and New York. While much farther, this route takes advantage of favourable winds and more than double the number of passengers can be carried. Additional clippers will be added in 1941.

In the Pacific the regular schedules were maintained from the U.S. to Hawaii, the Philippines and China. In addition, a new passenger route to New Zealand was inaugurated. This 8,000-mi. extension saves much time over steamship schedules. Another new route established by P.A.A. was from Seattle to Juneau, Alaska. This line has considerable military value because of the increasing strategic importance of Alaska and the establishment of both army and navy bases there.

Pan American airways service from the U.S. to South America was increased as much as 50% during 1940. Schedules from Miami to Rio de Janeiro were cut two days when a new cutoff was established between Belem, Pará and Rio. Pressurized Boeing "Strato-Clippers" are used which fly directly between these two cities, rather than follow the bulging coast line.

Another air line, American Export, a subsidiary of the steamship line, entered the international picture when it was approved to fly to Lisbon. It expects to begin its Atlantic service in 1941. This line also entered the Central American sphere when it purchased the highly successful TACA air line, which operates through five Central American countries.

U.S. Transport.—Air lines within the United States had their most prosperous year to date in 1940. Every line found itself with increased passengers, mail and air express. Many new aeroplanes were purchased and additional territory was added to existing routes. Although 1939 had been a banner year, traffic in 1940 was from 50% to 75% better than in each month during the previous year. The number of revenue passengers was more than 2,700,000 for the 12 months, compared with 1,703,300 for 1939. Profits for the first nine months of 1940 were 78% better than for a similar period in 1939. Total value of air express was over \$3,000,000 compared with \$2,385,000 in 1939.

At the end of 1940, the greatest problem of the air lines was not how to get more passengers but rather how to get aeroplanes in which to carry them. The air lines had approximately 350 aeroplanes in service. Due to the rapid expansion in 1939 and 1940 and expanded routes planned for the future, some 435 additional

FOUR LOCKHEED LODESTARS, reputedly the fastest transport planes in the world, began passenger service in 1940

planes had been ordered, largely from two manufacturers: Douglas and Lockheed, although a half-dozen were on order from Boeing. Claiming that both the aeroplanes and engines could be put to better use in the army air corps, the priorities board of the national defence commission restricted the sale of a large share of the equipment ordered by the air lines. The air lines expect to receive some of the aeroplanes they have ordered but the proportion had not been set by the end of the year. Among the ships whose delivery will be delayed are the four-engined Douglas DC-4s, that will carry twice as many passengers as the DC-3s, in 1940 standard equipment on most of the large air lines. Air lines had hoped to get the first of these large ships in the spring of 1941 but it is problematical if any will be completed before 1942. Delays in getting equipment will definitely be a handicap to domestic air lines.

Private Flying.—The greatest expansion in private flying in the history of American aviation took place in 1940. Under the auspices of the government's civilian pilot training program some 50,000 flight students were given instruction during 1940 in 700 training centres, and several thousand additional pilots learned to fly on their own initiative. The bulk of the government's pilot program was operated in connection with colleges and universities. Students paid approximately \$30 and received a minimum of 35 hours of flight instruction, plus a considerable amount of preliminary ground instruction in regular classes. Selected students were chosen for an additional 35 hours of advanced training. Noncollege groups were taught to fly under the auspices of various civic groups, working under C.P.T. program supervision, after ground instruction had been given. When the program was started in 1939 there was no talk of military value in the plan. However, by the fall of 1940, students accepted for training had to indicate a willingness to join military units if they were called upon. Refresher courses were also being given men who had previously learned to fly, but who had not kept up their flying.

Under the tremendous stimulus of the government's flight training program, the fixed-base operators also had their best year to date. These operators sell aeroplanes, teach flying, rent aeroplanes, conduct charter services and operate repair shops. They are the backbone of the non-air-line civil aviation in the U.S. Prior to the start of the government's C.P.T. program, many fixed-base operators lived on a hand-to-mouth basis, selling a few aeroplanes per year and earning some money from renting planes to private pilots. The Civil Aeronautics authority wisely decided to turn over its flight instruction to this group of men. In the program the operators supplied the aeroplanes and the instructors and were paid a flat rate for these services. Profits were not large but they could be depended upon. Activity at an airport breeds more activity and the government's pilot program

quite definitely stimulated flying in all parts of the country. On July 1, 1940, at the end of the government's fiscal year, there were 41,006 certified pilots. This was 56.8% more than the 26,144 in 1939. By Dec. 31, 1940 it was estimated there were more than 65,000 active pilots.

Manufacturing of Civil Planes.—Approximately 6,880 civil aircraft were built in the U.S. in 1940 as contrasted with the 3,715 built in 1939. Increases were in all branches of civil aircraft: transport, light planes and larger planes for private fliers. Great impetus was received in the light plane field (two- and three-passenger ships) from the government's pilot program. Over 4,500 planes of this type were built. The largest single type built was the two-place tandem trainer used for instruction purposes.

Technical Developments.—There were no radical changes in design in either aeroplanes or engines during 1940. Refinements in interiors were the outstanding changes in small aeroplanes. The trend was to "automobile type" cabins, with better upholstery, wider windows and better-designed instrument panels. Designers improved the cowling around engines in light planes but made few other changes in exteriors. Almost no changes were made in the design of transport planes except in the Boeing Model 307 planes introduced by Transcontinental & Western Air and by Pan American airways. Each of these lines purchased several of the large Boeing land planes. These were the first pressurized commercial planes built for flying in the stratosphere. At about 8,000 feet the interior of the plane is supercharged so that although the aeroplane may fly at much higher levels, pressure felt by passengers is that of 10,000 to 12,000 feet altitude. This makes for increased comfort to passengers. This aeroplane is equipped with four engines.

In the field of aeroplane engines the trend was to greater horsepower. Light plane engines had been producing but 40 h.p. Since 1937 the power output has been growing until in 1940 65-h.p. engines were most popular and an increasing number of 75-h.p. engines were being built. Light engines were more dependable than at any time in aviation history.

Under pressure from the military services, the power of large radial engines has been pushed up each year. While radial engines of 1,100 h.p. were standard equipment with many air lines in 1940, engines developing 1,550 h.p. were in use on Pan American's At-

AN AMERICAN "FOOL-PROOF" PLANE—the "Ercoupe"—was placed on sale in the summer of 1940. The plane cannot slip into a spin, and, with its tricycle landing gear, will not ground-loop. In the picture, the pilot is landing with both hands off the steering wheel

lantic clippers. Engines of 2,000 h.p. were built and the engine factories built experimental engines with considerably greater power.

The contest between radial and in-line engines continued. The two largest engine builders in the United States have won their enviable reputation on air-cooled radial engines. In a desire to secure an engine with less frontal area, offering less resistance to the air stream, the U.S. army air corps encouraged the building of a liquid-cooled in-line engine which in 1940 was being turned out in quantities for several military aeroplanes. This engine, however, had far less power than the largest radial engines being built. The U.S. navy, using radial engines, claimed faster aeroplanes than the army could build around its in-line engine. As in previous years, diesel engines played almost no part in the U.S. scene.

Accessories.—Due to the demand for better aeroplanes and equipment, there was steady progress made all through the accessory field, although there were no outstanding inventions making their appearance for the first time. Because of pressure from the service departments of both military and civil flying, equipment was more easily maintained than before. The air lines especially have put great emphasis on the desirability of simple maintenance. All parts of the aeroplane and engine must be designed so that they can be easily inspected and quickly removed during overhaul.

In the field of private flying considerable advance was made in small radio sets for communication between the aeroplane and the ground. In 1940 it was necessary for pilots approaching many large airports to have at least a receiving set, in order that directions might be received from control towers. Radio sets were considerably cheaper than a few years earlier.

Airports.—In most countries of the world civil airports have been taken over for military purposes. In the United States the government continued its policy of using WPA labour to improve municipal airports. This has been a valuable contribution to civil aviation. At the middle of 1940 there were 2,655 airports in the U.S., some 200 more than at the beginning of 1940. Hundreds of fields were being improved.

As military flying increased, the lack of sufficient fields for private flying was becoming serious in a number of cities. The situation near New York city was typical. Many private fliers and fixed-base operators had been forced to leave the old North Beach airport when it was bought by the city for an air-line field. This later became La Guardia field. Operators and pilots moved over to the municipal Floyd Bennett field. However as a naval reserve aviation base there became more active, there was a possibility of all private aviation being forced to leave. There was no other nearby field to accommodate them. Because of the government's flight training program, increased air-line and military activities, all airports were crowded. There was talk in congress of voting huge sums for new airports but this had not been done.

Civilian Schools.—Under the terrific impetus of training men for jobs throughout the aviation industry, civilian aviation schools in the U.S. thrived as never before. The army used civilian schools for two purposes: to train pilots and to train mechanics. Selected schools were chosen for each type of training. This is the first time since 1918 that private schools have been used by the air corps.

New schools sprang up in all aviation manufacturing centres to prepare the thousands of men needed for factory work. The greatest concentration of schools was in southern California, the second greatest near New York city. Many public school courses were offered, especially short courses in such subjects as aircraft sheet metal which could be given in a few months and put

to quick use in aeroplane plants. In some sections public schools were operated on a three-shift basis. (See also AIR FORCES; AIRPORTS AND FLYING FIELDS; GASOLINE; MEDICINE; PSYCHOLOGY, APPLIED; PUBLIC HEALTH ENGINEERING; RAILROADS; UNITED STATES: *Transportation.*) (C. N.)

Aviation, Military: see AIR FORCES; BLOCKADE; EUROPEAN WAR; MARINE CORPS; MUNITIONS OF WAR; PSYCHOLOGY, APPLIED; see also under various countries.

Avila Camacho, Manuel (1897—), president of Mexico, was born at Teziutlan in the state of Puebla on April 24. After completing a course of commercial studies in his native town he joined the successful revolution against Victoriano Huerta in 1914 and was promoted through various grades in the army to the rank of general of division. In the cabinet of President Rodriguez he was minister of war and navy. President Cárdenas later appointed him secretary of national defence and personally selected him as successor to the presidency.

On Nov. 3, 1939, he was formally nominated as the presidential candidate of the Mexican Revolutionary party.

Avila Camacho's principal opponent for the presidency was Gen. Juan Andreu Almazán, who had a considerable following among the nation's conservatives. In the election of July 7, 1940, Avila Camacho handily defeated Almazán, with the help—according to Almazán supporters—of "influence" exercised at the polls. On Sept. 12 the Mexican congress formally declared Avila Camacho the winner by 2,476,641 votes to 151,101 for Almazán. The latter, who had threatened assumption of power by force, dropped his claims to the presidency Nov. 26, and Avila Camacho was duly inaugurated Dec. 1. In his inaugural address the new president pleaded for unity of the American republics. One of his first official acts departed from Cárdenas' semicomunistic agricultural policies by restoring communal farmlands to the farmers working on them. Prior to his election, Avila Camacho had declared his opposition to communism. On Dec. 4 Archbishop Martinez of Mexico City issued an appeal to all Mexican Catholics to collaborate with the new regime.

Azaña y Diez, Manuel (1880–1940), ex-president of Spain, was born in Alcala de los Henares in Castile on Jan. 10. He was educated at the Augustinian academy at El Escorial and began his career as a playwright and author. For 12 years he was secretary of a literary society in Madrid, during which he won fame as a critic who expressed his opinions freely. He was indifferent to politics until the establishment of the republic in 1931, when he became minister of war in the provisional cabinet. His army reforms were unpopular with the officers and are said to have been largely responsible for the revolt led by General Franco in 1936. When Niceto Alcala Zamora was deposed as president in 1936, Azaña was chosen to succeed him. In November, however, the revolt led by Franco forced him to flee from Madrid to Barcelona, and he moved with his cabinet from place to place until it was apparent that his cause was lost. He then went to Paris and took refuge in the Spanish embassy. He died Nov. 4 at Montauban, France.

Azerbaijan S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Bacon. Production of sliced bacon in the U.S.A. during the 12 months ending Oct. 31, 1940 was 313,119,482lb. compared with 266,814,540lb in the 12 months ending Oct. 31,

1939. The 1940 production was an all-time record. From 1935 to 1940 inclusive production of sliced bacon in the United States steadily increased at the rate of about 12% annually. A new technique was developed to handle the product at predetermined temperatures with machines especially designed to turn out thousands of pounds per day and the time required between slicing and packaging reduced to seconds. Bacon is one of the principal processed meat foods with which the American Meat institute is trying to restore the volume of meat consumption (see MEAT).

Meat consumption in the United States has declined from 162.6 lb. per capita in 1908 to 131 lb. in 1939. Output of bacon increased greatly in Canada during 1940 owing to the record number of hogs and to the wartime orders of bacon and hams to be shipped to the United Kingdom.

In the first 10 months of 1940 slaughter of hogs in Canada was 4,049,794 head compared to 2,747,733 in the same period in 1939. The British government contracted to take 5,600,000 lb. of bacon and hams weekly through the year ending Oct. 31, 1940. This amount was increased to 8,176,000 lb. weekly for the year ending Oct. 31, 1941. (See also Hogs.)

Monthly Output of Sliced Bacon in U.S., 1939 and 1940

Month	Year ending Oct. 31, 1940 lb.	Year ending Oct. 31, 1939 lb.
November	22,003,197	19,967,669
December	22,336,794	18,607,520
January	24,778,179	19,860,787
February	21,755,898	18,169,033
March	23,300,006	20,793,982

October	27,487,836	24,802,723

(S. O. R.)

Bacteriology. The experimental study of infantile paralysis (poliomyelitis) has been retarded due to the fact that no experimental animal other than the monkey had been found susceptible to this disease. Recently the eastern cotton rat, *Sigmodon hispidus hispidus*, has been found susceptible to only one strain of the virus of poliomyelitis. This strain has been designated the Lansing strain since it was isolated from the brain and cord of an 18-year-old boy who died of bulbar poliomyelitis in Lansing, Mich., in 1937. The eastern cotton rat was found to multiply readily in captivity and not to be vicious. In this animal the symptoms observed were a roughened appearance of the fur and a tendency to react by violent jumping when agitated, followed by flaccid paralysis which may involve the legs in all combinations. Respiratory difficulty has also been observed. Since 26 serial passages from rat to rat the virus became progressively better adapted with an incubation period (from intracerebral inoculation to appearance of symptoms) of from 3-5 days. Since adapting the virus to the eastern cotton rat it was found that the rat virus could be subsequently adapted to the white mouse. An appreciable percentage (68.7+) of human serum mixed with Lansing mouse virus and injected into white mice protected them against this virus. Serum from individuals who have not experienced clinical poliomyelitis may neutralize the virus as well as serum from patients convalescing from poliomyelitis. The percentage of sera giving protection increased with the age of the donors. More protection was shown by sera of persons living in orphanages than by those of the same age group living in private urban dwellings.

Considerable work is being done by groups of bacteriologists and chemists on accessory factors necessary for the growth of microorganisms. Some haemolytic streptococci require vitamin

B₆ in addition to other accessories such as riboflavin and pantothenic acid. Pantothenic acid is needed by certain diphtheria bacilli, especially the gravis type. Beta-alanine, which is a portion of the pantothenic acid molecule, is insufficient for these strains. Dysentery bacilli can be grown in a synthetic amino acid medium with nicotinic acid or nicotinamide. A study of many related compounds has revealed a striking similarity between those promoting the growth of bacteria and those alleviating the symptoms of pellagra in man and blacktongue in dogs.

Advances are being made in chemotherapy of bacterial infections. New derivatives of sulphanilamide are being prepared and tested. Sulphathiazole is one such product which has been found efficient in the treatment of some infections caused by staphylococci. Sulphanilylguanidine is fairly soluble in water but is poorly absorbed from the intestinal tract. This property should make the drug of value in the treatment of intestinal infections. Both of these drugs are in the experimental stage and much more careful study of them is necessary before they can be recommended as valuable therapeutic agents.

Badminton. David G. Freeman of Pasadena, Calif., one of the first ten in tennis in 1938, repeated his claim to the title in 1940 by a second victory over his two-year rival, Walter Kramer. Freeman also shared the 1940 titles in the men's doubles with Chester Goss of Los Angeles, and in the mixed doubles with Miss Sara Williams of Spokane, Wash.

Miss Evelyn Boldrick of San Diego, Calif., led the women for the national title, while in the championship doubles the Misses Elizabeth Anselm and Helen Zabriskie, both Californians, proved that their superior net work was sufficient to claim the crown of the shuttlecocks.

The game made considerable headway in the east, with the sectional plums falling to Harold Seavey of Boston in the singles, and to John Laimbeer and Julian H. Burgiss in the men's doubles. Other eastern champions were Miss Mary Hagan, women's singles; Miss Helen Gibson and Mrs. Wanda Bergman, women's doubles; Mr. and Mrs. William Faversham, mixed doubles. Paul Vancso led the way to the Metropolitan (New York) singles crown as he did in 1939. (J. B. P.)

Badoglio, Pietro (1871-), Italian soldier, was born at Grazzano Monferrato, Piedmont, on Sept. 28. Entering the army as a youth, he took part in the Eritrean campaign in 1896-97 and by the time of Italy's entry into the World War in 1915 had advanced to the rank of lieutenant colonel. His military genius was readily recognized by his superiors during the next three years; he was promoted six times and emerged from the war a general. Elected a senator in 1919, he went to Brazil

as ambassador in 1924, then returned to Rome the following year upon his appointment as chief of the army general staff. He was created Marchese del Sabotino in 1928 and during the next five years was governor general of Libya. His strategy in Ethiopia during the spring of 1936 brought about the unexpectedly rapid rout of Haile Selassie's forces and won for him the title of Italy's first soldier. He was appointed high commissioner for Italian East Africa in Nov. 1935 and viceroy of Abyssinia in 1936, but resigned from the latter office and was created duke of Addis Ababa. Marshal Badoglio assumed command of all Italian armed forces on June 11, 1940 after Mussolini's declaration of war against the Allies. Less than two weeks later he signed the Italo-French armistice. He was reputedly opposed to the Italian invasion of Greece, Oct. 28. At any event, he became the scapegoat for its initial failures and was relieved as chief of the general staff "at his own request" on Dec. 6.

Bahamas, a British colony and island group east and southeast of Florida; language, English; capital, Nassau (pop. 19,756); governor, H.R.H. the duke of Windsor; area 4,375 square miles. The population (1931 census: 59,828) was officially estimated at 67,729 in 1939. Government is administered by an appointed governor and legislative council and an elected assembly. On July 9, 1940, H.R.H. the duke of Windsor was appointed governor and commander-in-chief of the colony, succeeding Hon. Sir C. C. F. Dundas.

History.—During 1940 the European war continued to be the dominant factor in developments in the Bahamas. Over £20,000 for purchase of aircraft for the royal air force was raised by popular subscription and the colony's £250,000 surplus loaned the imperial government, interest free, for the duration of the war. Most important for its future effects upon the colony was the Anglo-United States "destroyer-base" agreement of Sept. 3 (*see* WEST INDIES, BRITISH) under which the United States received rights to base a naval and air base "on the eastern side of the Bahamas." The colony was subsequently visited by a United States mission and, in December, by Pres. Roosevelt.

Trade and Communication.—External communication is by air from Miami and by steamship, including a subsidized service from New York to Nassau. These services are vital to the maintenance of tourist trade, the most important factor in the Bahamas' economy, valued at \$5,000,000 annually. This traffic, along with a steady flow of funds for real estate investment, serves to offset the "unfavourable trade balance."

In 1939 imports were £180,281. Imports, largely foodstuffs, constituting 29.6% of the total, and spirits, motor cars and parts, tobacco, boots and shoes and cotton goods came principally from the British empire (Great Britain, 20.3%; Canada, 13.2%) and from the United States. Exports comprised especially sponges (39.97%); tomatoes (14.7%); and timber (8.7%). Other exports include crawfish, bark, sisal hemp and tortoise shell. Exports are taken chiefly by the United States (39.9%), Canada (22.1%) and Great Britain (17%). These export commodities and fish for local consumption are the chief products.

Education.—Education is compulsory. In 1939 there were 64 government schools with 10,376 pupils, 56 aided schools with 3,021, an industrial school (103 enrolment), and 49 denominational and private schools with 2,710 pupils. The government contributed £33,786 toward education. Secondary education is provided by a government high school and three denominational schools.

Finance.—The monetary unit is the pound sterling.

Bailey, Sir Abe (1864–1940), South African financier, was born in Cradock, Cape Colony, Nov. 6. Before he was 23 he had become a millionaire in South Africa by trading in gold shares. For the next 50 years he played a prominent part in the affairs of South Africa. He was knighted in 1911 and was created a baronet in 1919. Involved in the Jameson raid on the Transvaal in 1895, he was sentenced to death with John Hays Hammond and others, but the sentences were commuted and he served only 13 months in prison. He died in Cape Town, Aug. 10.

Balance of Trade: *see* INTERNATIONAL TRADE.

Balbo, Italo (1896–1940), Italian statesman and aviator, governor general of Libya, was born in Ferrara, Italy, June 6. When Italy entered the World War in 1915 he enlisted in an Alpine corps and was decorated with three medals for gallantry. At the end of the war he founded the newspaper *L'Alpino* in Udine and was one of the early supporters of the cause of the fascists. He was appointed undersecretary for air in Mussolini's cabinet in 1926 and in 1929 was appointed general of the air fleet and air minister. In 1933 he commanded 24 hydroplanes which flew from Rome to the Century of Progress fair in Chicago and return. The flight made him so popular in Italy that he was mentioned as a possible successor to Mussolini. He was then appointed air marshal and governor general of Libya. He was killed June 28, according to an Italian communiqué, in an air battle over Tobruk, Libya, while fighting British planes.

Balkan Entente. A diplomatic alliance of four Balkan states, Greece, Rumania, Turkey and Yugoslavia, which had its origin in conferences of the foreign ministers of these countries which culminated in the conclusion of a four-power Balkan pact in Belgrade on Feb. 2, 1934, formally signed in Athens on Feb. 9, 1934. According to this pact, the four countries mutually guaranteed the security of their Balkan frontiers and undertook to concert together in regard to the measures to be taken. This pact, which was directed against the territorial claims of Bulgaria, was declared to be open to any Balkan country; but all efforts to draw Bulgaria into the Balkan pact and thus to induce her to give up her revisionist claims failed. The pact was to remain valid for seven years, and was considered renewed automatically by tacit agreement for the period of seven years, failing denunciation by any one of the signatories one year before the date of expiration. Thus a power wishing to denounce the pact had to do so before Feb. 9, 1940.

In subsequent statutes the Balkan Entente gave itself a firmer organization by creating a permanent council composed of the ministers of foreign affairs, which was to meet at least twice a year. In addition, an Advisory Economic council for the progressive co-ordination of the economic interests of the four states was constituted. The high hopes for a growing co-operation among the four Balkan states and for the ultimate foundation of a Balkan federation, to secure the peace and freedom of all Balkan peoples, were not realized. The countries did not wish to commit themselves to promises of mutual and automatic assistance; Yugoslavia especially, strongly under the influence of Germany and Italy, resisted any tightening of her obligations.

The outbreak of the war in 1939 increased the tension in the Balkans. Rumania felt herself threatened by the Soviet Union and by Germany, who now acted in co-operation, with Germany seeming to support Hungary's claims against Rumania. Turkey felt uneasy in view of the Russian-German rapprochement, and concluded a treaty of alliance with Great Britain and France.

"HELP!" The cops and robbers were all robbers as far as the Balkans were concerned in 1940, according to Herblock of NEA Service

Greece, distrustful of Italy's intentions in Albania, accepted a British-French guarantee of her independence and drew closer to Turkey. Italy and Hungary tried to win Yugoslavia away from the Balkan Entente and from any possible support to her Rumanian ally, and thus with the help of Yugoslavia to disintegrate the Balkan Entente as its counterpart, the Little Entente, had been destroyed.

In conformity with its statutes, the Balkan Entente conference met on Feb. 2, 1940, in Belgrade. The Turkish foreign minister, Shukru Saracoglu, who represented his country at the conference, made it clear that Turkey would adhere to her alliance with Great Britain. Premier and foreign minister of Greece, John Metaxas, took generally a similar stand. The Rumanian foreign minister, Grigore Gafencu, tried to enlist the definite assistance of the other countries for defence of Rumania against any aggression. On the other hand, Yugoslavia's delegate, Foreign Minister Alexander Cincar-Markovitch, opposed any strengthening of ties among the Balkan countries. In view of the war situation, the attention of the world was focused on the meeting, but it was completely barren of any decision. The automatic continuation of the Balkan pact for another seven years was agreed to, but the respective national interests of the four countries seemed too divergent to permit any common stand to save themselves from the domination of foreign powers and to maintain their peace and liberty by collective action. Although the Entente was formally continued, the hope of closer Balkan unity which had animated many of the progressive Balkan patriots and their friends, and which alone could have guaranteed the peaceful development of the Balkan peoples, seemed ended, at least for the time being. The three days' conference closed with a hollow declaration of the four nations' "determination to maintain a common vigil over the preservation of each member state's rights to independence and territorial integrity." Bulgaria and Hungary were appealed to to enter into friendly relations and pacific collaboration with the

Entente. Subsequent events confirmed the disintegration of the Balkan Entente. Rumania had to cede territories to Hungary and to Bulgaria, without being able to count upon the support of her closest ally, Yugoslavia, with whom she had been united in the Little Entente and in the Balkan Entente. Yugoslavia worked hand in hand with Italy for the formation of a Yugoslav-Hungarian Entente. Greece had to face alone the onslaught of Italian fascist forces, supported only by Turkey's sympathy. Thus 1940 witnessed, under the pressure of the fascist forces, a rapid decline of the Balkan Entente similar to that which the Little Entente had suffered the year before. (H. Ko.)

Baltimore, metropolis of Maryland; area 78.58 sq.mi., 13.35 additional sq.mi. water; population (1940 census) 859,100; 7th city in United States, having moved ahead of St. Louis. Resident live births (1939) 12,525, including 3,314 Negro. Birth rate per thousand 14.4 (white 13.2, Negro 19.1); (1940, 11 months) total 12,600 live births, including 3,229 Negro, increasing rate to 15.7 (white 14.6, Negro 19.9). Death rate (1939) 11.9, with 14.3 Negro; (1940, 11 months) 12.9, with 16.1 Negro.

History.—The city officials in 1940 were: Mayor, Howard W. Jackson; comptroller, R. Walter Graham; president city council, Richard C. O'Connell. Terms expire 1943. Sewer loan of \$5,000,000 was approved by referendum in Nov. 1940. Paving loan for the same amount was disapproved. Daylight saving ordinance was disapproved by narrow margin. The first low-cost housing project was completed and opened for Negroes. Seven such projects were approved, estimated cost \$20,760,000. Three were for white families and four for Negroes.

Education.—Public elementary and high schools had a net roll (June 1940) of 110,823, including 30,197 Negroes; (June 1939) 112,243, including 29,782 Negroes. Roman Catholic elementary and high school enrolment (1938-39) was 35,414; other private schools, 3,207. New features in public educational program included extension of cultural advantages in art and music under a Carnegie grant and training for employment in defence industries.

Finances.—Appropriation for 1941 from the tax levy was \$52,475,208, an increase of \$1,456,271. Approved expenditures for special purposes from existing and tentative loans increased the total to \$62,099,251. The taxable basis for 1941 was \$1,501,117,794, an increase of \$8,418,006 over 1940. The tax rate increased 5 cents for 1941 to \$2.85 per hundred. Ninety-seven cents out of the tax rate was for debt service. Debt service was \$13,158,031, over half for debt retirement. Gross funded debt as of Dec. 1, 1939 was \$186,491,579 and as of Sept. 30, 1940 was \$175,646,079. When sinking fund and self-liquidating debt are deducted the 1939 net general debt was \$103,304,424, and for 1940 was \$99,293,956. Funds available for public improvements under the pay-as-you-go plan were \$10,862,600 for schools and sewers.

Trade and Manufactures.—Thirty-four new industries and 98 expansions in existing plants, representing \$32,280,000 plant investment were announced during 1940, an increase of 63% in value of plant investment over 1939. The expansion resulted directly from rearmament program. (C. B. S.)

Bananas. Imports of bananas by the United States in the year ending June 30, 1940, were valued at \$29,272,617. Bananas are the only foreign fruit whose imports into the United States have not steadily declined since 1937. Shipments of bananas in 1940 were materially hampered in several countries by lack of shipping and wartime restrictions. It was estimated that Jamaica shipments for 1940 would be slightly under 10,000,000

stems, compared to 15,528,000 in the preceding year. Up to Sept. 14 shipments from Jamaica were 4,458,000 stems. Shipments from Guatemala the first seven months of 1940 were 6,350,000 stems, compared to 6,926,000 stems in the same period in 1939. Most of the shipments went to the United States, except 58,000 stems to the United Kingdom in June, the first to that destination from Guatemala in many months. It was estimated that 3,000,000 stems were lost in the Pacific coast banana zone of Guatemala through a violent storm in June. Costa Rican shipments the first eight months in 1940 were 2,053,754 stems as against 2,345,714 stems in 1939.

Banana shipments from Haiti from Oct. 1, 1939, to Sept. 20, 1940, were 2,140,412 stems, and for the year ending Sept. 30, 1939, they were 2,029,767 stems.

All shipments from Panama were to the United States and for the first six months of 1940 were 2,706,890 stems, valued at \$1,237,073.

The foregoing data are from the U.S. bureau of foreign and domestic commerce. (S. O. R.)

Bankers Association, American: see AMERICAN BANKERS ASSOCIATION.

Bank for International Settlements. From the end of March to the end of Dec. 1939, *i.e.*, during the period of growing tension in Europe and the first four months of the war, the total of the bank's balance sheet was reduced from 606,500,000 to 479,700,000 Swiss gold francs. Since then the total has remained comparatively stable, amounting to 469,900,000 Swiss gold francs on March 31, 1940 and 485,700,000 on Oct. 31 of the same year. In the tenth annual report of the bank, published in May 1940, it is said that in a large measure the reduction in the balance sheet during 1939 "may be explained by a tendency among the various central banks, in present disturbed conditions, to maintain their foreign reserves either in gold or as direct deposits with banks in the markets where payments have to be made. It is satisfactory that the bank has been able to meet all its obligations without difficulty and still to maintain a high degree of liquidity." The volume of current business was, of course, also affected by the extension of warfare; nevertheless the bank continued to be entrusted with foreign exchange and gold operations, mainly for the account of neutral central banks. The result of business operations for the financial year ending March 31, 1940 showed a profit of 7,962,000 Swiss gold francs compared with 8,584,000 in the preceding financial year. This result permitted the distribution of a 6% dividend in gold without drawing on the special reserve fund. The annual report makes the following comments on the bank's activities: "The outbreak of hostilities has brought to an end business between countries at war with each other. Trading with the enemy acts and the various other measures for waging economic warfare as announced by the belligerent nations have curtailed or stopped business in many other directions. The policy of the Bank for International Settlements has been and is to confine its activities strictly to transactions whereby no question can possibly arise of conferring economic or financial advantages on any belligerent nation. A letter setting out the principles which the bank felt itself under obligation to observe was directed to all clients in December and has received general approval as giving expression to a policy of scrupulous neutrality."

In the period of acute tension in May 1940 the bank temporarily transferred its offices to Château-d'Oex in the Swiss mountains, but opened again in Basle at the beginning of the following October. (P. JN.)

Bankhead, William Brockman (1874-1940), U. S. statesman, was born in Moscow, Ala., April 12, the son of John Hollis Bankhead, who later was elected to the United States senate. He was graduated from the University of Alabama in 1893 and from Georgetown university law school in 1895. He then went to New York city with the intention of opening an office and joined Tammany Hall. He was ambitious to go on the stage, but his mother dissuaded him, and after two years in New York he went to Huntsville, Ala., where he began the practice of law. He served one term in the Alabama legislature and in 1916 was elected to the national house of representatives as a Democrat and was re-elected to 11 successive congresses thereafter. He was named chairman of the house rules committee in 1934 and floor leader in 1935, and in 1936 he was unanimously elected speaker to succeed Joseph W. Byrns, who had died in office. He was the keynote speaker at the Democratic national convention in Chicago in 1940 and was an active candidate for nomination for vice-president but was defeated in the convention. He died Sept. 15 in Washington, D.C.

Banking. Continued growth in deposits occurred during 1940 in the banking system of the United States, chiefly due to further large imports of gold to the U.S. from war-torn Europe, and to continued financing of the government which again operated at a substantial deficit. The number of banks in operation varied slightly from the previous year, standing at 14,952 on June 29, 1940, the latest date for which complete figures are available, as against 15,082 on June 30, 1939. Deposits, however, stood at \$60,582,000,000, an increase of \$4,590,000,000 over the figure of \$55,992,000,000 shown a year earlier.

The most important of the total number of banks are those which are members of the Federal Reserve system, whether national or state banks or trust companies. These numbered 6,398 with deposits of \$42,039,000,000 and constitute the backbone of the commercial banking system. The growth in deposits referred to above occurred primarily in this system, which accounted for a gain of \$4,012,000,000. Reserves of member banks with the Federal Reserve banks reached an all-time high during the year, excess reserves on Oct. 18, 1940 standing at \$6,868,000,000. At the same time gold stock in this country had accumulated to the record-breaking figure of \$21,428,000,000. The great increase in bank deposits was accompanied by an increase in money in circulation to a new high mark of \$8,700,000,000, the two together providing an unprecedented supply of funds. (For activities of the board of governors of the Federal Reserve system and the treasury in the field of money and credit control, see FEDERAL RESERVE SYSTEM.)

The rate of business activity as reflected in the turnover of bank deposits did not keep pace with the increase in deposits. Total loans of all member banks showed little change during the first half of 1940, country bank loans increasing while loans in New York city banks showed a decrease, with brokers' loans declining to the lowest levels on record. In the second half a considerable increase in loans occurred, due primarily to stepped-up activity under the federal defence program. Real estate loans increased, continuing a five-year period of growth amounting in all to a rise of 37%.

Holdings of U.S. government obligations, direct and guaranteed, increased substantially, notwithstanding greatly reduced yields. A further tendency of concern to banks was that of the elimination of tax exemption on government issues, a five-year taxable issue being offered successfully by the treasury in December at an interest rate of 3/4%. Banks continued to reduce their holdings of corporate securities and to increase holdings of state and local government obligations.

Earnings of member banks of the Federal Reserve system showed an increase for the year ended on June 29, 1940, due to the sharp lift in earnings for the first half of the period. An analysis of these earnings shows that there was a further decrease in interest on securities, reflecting lower rates of return, but an increase in interest received on loans, which grew in volume, with increased acceptance of term loans. Trust department earnings, commissions and service charges on deposit accounts continued to be considerable factors, amounting to about 14% of total current earnings.

A rising tendency was evident in expenses, particularly salaries and wages, which were affected by the application of the Federal Wages and Hours law. In addition, all member banks were made subject to the Social Security act after Jan. 1, 1940.

On April 10, 1940, the president issued an executive order which, together with treasury regulations issued thereunder, provided that all transfers of credit, foreign exchange or other financial transactions involving Danish or Norwegian property shall be subject to license by the secretary of the treasury. Other countries were added to the list later as they suffered invasion, including Belgium, the Netherlands, Luxembourg and France. Italy was added during the year to those countries coming under the credit ban of the Neutrality act as a belligerent.

To facilitate the full co-operation of the banks in the national defence program, congress passed an act to permit the assignment

of claims under public contracts. A survey by the National Defense Advisory commission disclosed that the commercial banks of the country were ready to loan at least \$3,000,000,000 to manufacturers for emergency defence plant construction. Defence loans by banks will be augmented by loans of the Reconstruction Finance corporation to private corporations and to government corporations organized to accumulate strategic commodities for use only in case of war emergency, namely, Rubber Reserve company, Metals Reserve company, Defense Supplies corporation, and Defense Plant corporation. In recognition of the need of increased participation by small business in the defence program, the National Defense Advisory commission appointed a director of small business activities who will co-operate with local banks and the R.F.C. in assisting such concerns in financing defence contracts. Further studies were made by the Temporary National Economic committee as to means of financing small business. The volume of new securities sold by corporations continued at a low level and the new offerings were chiefly for the refunding of old issues to take advantage of record low rates of interest rather than to raise new capital.

A convention for the establishment of the Inter-American bank was signed on May 10, 1940 by the United States and representatives of seven Central and South American countries, subject to ratification by those countries and the congress of the United States. (See also BONDS; FEDERAL LAND BANKS.)

Great Britain.—The shock of the war was felt with increasing intensity by the banking system throughout the year 1940, every effort being directed toward facilitating the functioning of defence industries. Commercial bank deposits increased for the year ending Aug. 31, from £2,245,000,000 to £2,481,000,000. After an increase directly after the outbreak of the war in 1939, the volume of loans receded somewhat, while government security holdings increased. The banks assisted the British treasury in mobilizing foreign balances and certain United States dollar securities in the hands of British investors, which were directed to be turned over to the Bank of England against payment in the sterling equivalent.

Canada.—The forces of recovery at work in the previous year were augmented in 1940 by continued concentration on production for the prosecution of the war. The banking system was called upon to absorb a large part of the government securities issued for this purpose. Restrictions were progressively tightened on export of Canadian funds and securities by the Foreign Exchange Control board, whose regulations were issued to the banks as the only authorities, besides post offices and express companies, allowed to deal in foreign exchange. The balances of the chartered banks with the Bank of Canada rose from \$221,127,000 to \$231,336,000 during the year ended Sept. 30, 1940. The gold reserve of \$225,000,000 was transferred to the Foreign Exchange Control board against short-term government securities. Note circulation rose from \$212,490,000 to \$331,957,000. The ten chartered banks reported a successful year with improved earnings in some instances. Deposits increased from \$2,524,000,000 to \$2,689,000,000 during the year ended Aug. 31, 1940. Earning assets were still preponderantly in investments, which increased during the year from \$1,507,000,000 to \$1,569,000,000, while commercial loans increased from \$957,000,000 to \$1,062,000,000.

Europe.—International movements of funds continued to affect banking in 1940, particularly just before the invasion of France and the Low Countries. After May 1940, banking figures were not available for Denmark, Norway, the Netherlands, Belgium, Luxembourg and France, because of the invasion of these countries by Germany. The latter country last reported commercial bank figures for the year ended June 29, 1940, showing a progressive increase in deposits with a rise in loans and bills discounted and a reduction in security holdings. The Reichsbank reported continued increase in note circulation from 10,995,000,000 marks to 12,847,000,000 marks in the year ending Sept. 30, while treasury bill holdings increased from 10,105,000,000 marks to 13,206,000,000 marks, indicating inflationary tendencies due to the war effort. Central European countries gradually came under the economic influence of Germany, due partly to the British blockade. The Bank for International Settlements still continued operations, but with very limited functions. (See also BANK OF FRANCE; EXCHANGE CONTROL AND EXCHANGE RATES; FINANCIAL REVIEW; SAVINGS BANKS, MUTUAL.)

(E. B. L.)

Bank of England. As in more normal times, throughout 1940 the Bank of England worked in co-operation with the treasury, acting as the government's agent and adviser within its purview. In the summer of 1940 this link was strengthened by the appointment of Lord Catto, a director of the bank, to the new position of financial adviser to the treasury.

Internally the bank's main task was to keep money plentiful and easy, while preventing the growth of monetary inflation. As other and equally important tasks, the bank was concerned in the issue of the various war loans. In February it helped to carry through the conversion of the 4½% conversion loan into 2% 3-5 year bonds. This meant that only £100,000,000 of the old loan of £350,000,000 had to be repaid in cash on July 1. The 3% war loan of £300,000,000, issued in March, was very well timed, as its issue just preceded the outbreak of active warfare. In June, when the French collapse unsettled the stock markets and so made it doubtful whether another big loan could be placed, the

decision was taken to issue 2½% National War bonds on tap. Initial subscriptions to these helped to finance the conversion loan repayment, and a steady stream of subscription continued.

In its main task the bank had to contend with the growth in public expenditure financed out of borrowing from the banking system; and with a growing demand for currency during the summer. In June the device was adopted of asking the clearing and Scottish banks to lend their surplus cash to the government against treasury deposit receipts; and up to Dec. 31, 1940, £338,000,000 had so been borrowed. This kept within bounds direct borrowing from the Bank of England, with a consequent enlargement of the credit base. Government securities held by the bank only (in both departments) rose by £43,000,000 between the outbreak of war and Oct. 8, 1940.

Fear of dislocation of communications, air raid damage and possible invasion caused the clearing banks and also many members of the public to hold additional currency reserves. Hence the growth of £70,000,000 in the note circulation between May 8 and Aug. 14. This growth necessitated an increase in early June of £50,000,000 in the fiduciary issue. After Aug. 14, these apprehensions subsided, despite the more intensive air attacks. Thus part of the additional notes returned from circulation.

Externally, the bank co-operated in the strengthening of the foreign exchange control. Agreements with foreign countries and also with some leading American banks enabled a system of special accounts to be set up. Payments for imports and exports and other international transactions pass almost entirely through these accounts. Therefore nearly all exchange transactions pass through the hands of the authorities at the official rate of exchange, and very few reach the New York free market in sterling. The latter therefore has been practically killed, and control over all foreign exchange resources is complete.

The German occupation of a large part of Europe meant that there was danger of Bank of England notes held by European nationals falling into enemy hands. The risk was lest the enemy might realize these notes in New York. To prevent this, the importation of bank notes was prohibited in August, though a few days' grace was given after the announcement of the order. A certain quantity of notes was probably returned during the days of grace, and this helps to explain the drop in the note circulation which then occurred. A few weeks later a similar prohibition was imposed on the importation of British bearer securities.

Bank of France. Very little information of a financial character was forthcoming from France, even before the surrender of June 1940. The Bank of France's return, up to May 30, the latest date available, shows that during the war the French government borrowed heavily. The money so obtained and disbursed by the government led to an expansion of about 40% in the note circulation.

There was only a small drop in the bank's gold reserves, but it is understood that shortly before the June armistice the bulk of the bank's gold was shipped to the United States for safer custody. It presumably comes under the U.S. administration's "freezing" order, and so is immobilized.

After the German occupation of Paris and northern France, the Bank of France was believed to have come under German control. Little authentic news was forthcoming, but there was thought to have been a further substantial growth in the note circulation, to finance the expenses of the German army of occupation and other French government expenditure, and also German purchases of French commodities. The backing of these extra franc notes was probably reichsmark notes of one kind or another.

Bankruptcy. The year 1940 saw no major additions to the legislation which had made the period from 1933 to 1938 notable by vastly extending the scope of the Bankruptcy act. Chapter XV, the Railroad Adjustments act (Public No. 242, 76th congress, 1st session) expired during 1940; while the operation of chapter IX, providing for the readjustment of debts of taxing districts, was extended until June 30, 1942, and counties and parishes were expressly added to the other taxing units which may utilize that chapter (Public No. 669, 76th congress, 3rd session). In clarification of the law an amendment to the tax statutes (Public No. 699, 76th congress, 3rd session) further defined the basis of valuation of debtors' property for income tax purposes upon consummation of reorganization proceedings under chapters X, XI and XII of the Bankruptcy act. And, *inter alia*, the Investment Company act of 1940 (Public No. 768, 76th congress, 3rd session) amended section 44 of the Bankruptcy act to provide that trustees in bankruptcy for face-amount certificate companies shall be appointed by the court alone, and altered section 67 of the act in order to achieve greater equality among creditors in the distribution of assets of such investment companies.

With the waning novelty of the legislation of the preceding six years, the content of court decisions and legal commentary turned predominantly to consideration of the interpretive and administrative aspects of these statutes. In these matters the court's rulings in 1940 were for the most part the usual judicial grist; a few were outstanding. In perhaps the most significant decision of the year the supreme court delineated the proper spheres of operation of chapters X (corporate reorganization) and XI (arrangements) of the Bankruptcy act, *Securities and Exchange Commission v. U.S. Realty and Improvement Co.*, decided May 27, 1940. The court's opinion by Justice Stone sustained the commission's argument that the reorganization of corporations in which there is a public-investor interest is appropriately the subject of proceedings under chapter X because of its express provisions for the protection and guidance of the public interest; and for that reason reorganization proceedings for such companies under chapter XI, which is lacking in comparable provisions, should be dismissed as not brought in good faith. Among these provisions was the one placing in the Securities and Exchange commission the duty to act as a party in chapter X cases for the purpose of aiding both the courts and the investor. During the year this aspect of the commission's jurisdiction enlarged in usefulness as the number of cases in which it participated rose above 150, and recognition of the value of the commission's activities was voiced increasingly by bench and bar.

The direction and impetus given generally to reorganizations in 1939 by the opinion of the supreme court in *Case v. Los Angeles Lumber Products Co., Ltd.*, 308 U.S. 106, clarifying the requirements of "fair and equitable" reorganization plans, were strongly reflected in plans for railroads under section 77, which in 1940 began to move toward consummation at an accelerated pace. Toward the close of the year the requirements of fairness in plans under the municipal, corporate and railroad reorganization chapters of the Bankruptcy act were further defined by the supreme court in *American United Mutual Life Insurance Company v. City of Avon Park, Florida*, decided Nov. 25, 1940. There, in an opinion by Justice Douglas, who became the court's leading spokesman on matters of bankruptcy and reorganization, the court ruled that in measuring the reasonableness of applications for allowances for fees and expenses in a chapter IX proceeding, the sum of all the emoluments to be derived from the proceeding by the applicant, including fees directly or indirectly charged and speculative profits from the acquisition of claims at discounts or defaulted prices, must be considered. The court held, also, that a person who seeks the assents of other security holders to a plan must fully disclose any benefits he will himself derive from the plan. If a person acting in such representative capacity fails to do so, the assents of others are not fairly obtained, and his own assents, representing his personal security holdings, are ineffective to make up the number required by the statute. The opinion reiterated the responsibility of courts of bankruptcy before approving a plan "to be

satisfied that the plan in its practical incidence embodied a fair and equitable bargain openly arrived at and devoid of overreaching, however subtle," and emphasized the broad power of the courts to apply a variety of remedies suitable to the attainment of these ends.

At the close of the year the attorney general's committee on bankruptcy administration, completing its 20-month study of the act, submitted a report to the congress in which it suggested legislation to make effective two principal recommendations; that responsible and co-ordinated supervision of bankruptcy administration be made a permanent function of the administrative office of the United States courts; and that referees in bankruptcy, who in practical operation are the administrators of the Bankruptcy act, be placed on a full-time salary basis to replace the anachronistic fee system which has prevailed since the original enactment of the federal bankruptcy law. (See also RAILROADS.)

Baptist Church. The Baptists of the U.S.A. are divided into two main bodies: the first, three groups totalling over 10,000,000 members; the second, 15 miscellaneous groups with some 500,000 enrolled. In the first division the Southern convention has a membership of over 4,500,000; the Northern, nearly 1,500,000; and the National (Negro) well over 3,500,000. Reports from the denomination as a whole indicate a loss in membership for the year, May 1939–May 1940.

The home mission and the foreign mission boards of the Southern convention reported increased gifts to their respective causes. The foreign board stated that Baptists in China are opening up new work. The China Baptist Theological seminary in Kaifeng, opened in Sept. 1939, is an example of this. It also reported that there are more missionaries in Africa than ever before—a total of fifty-eight.

The foreign board of the Northern convention presented an authorized budget of \$891,320 for 1939–40 which was increased to \$895,610 for 1940–41. Although the mission fields of this convention have greatly suffered from the ravages of war, nevertheless, some most encouraging reports were received. Again from China: "The net result has been that Christianity today faces perhaps its greatest opportunity in the long history of Christian missions in China."

In Japan, on Jan. 3–5, 1940, the two Baptist conventions—the East, associated with the Northern convention in the United States, and the West, associated with the Southern—consummated a union to be known as the "Japan Baptist Church." As was to be expected, the war threat to America concerned the conventions of 1940. At the Northern, the question of the denomination's recognition of conscientious objectors caused prolonged debate and in the Southern, the menace to religious liberty gave deep concern.

Barley. The 1940 barley crop in the United States was 309,235,000bu., as estimated by the department of agriculture Dec. 1. The 1939 crop was 274,767,000bu., and the ten-year (1929–38) average 225,486,000 bushels. Adequate and timely rainfall that was not heavy enough to promote the development of rust contributed to production that was about 37% above average. Acre yields were 12.6% above average, while the acreage was 23.1% above average. Nearly all the leading barley states had larger acre yields: Illinois 12bu. and Michigan 11bu. above average, Wisconsin 10bu., Indiana 9bu., Minnesota 8bu., Iowa 7bu., Missouri 6bu., and the Dakotas 3 bushels. In Canada the 1940 crop was estimated at 110,538,000bu. compared to 103,147,000bu. in 1939. In England and Wales the plowing up of pasture lands and other efforts to increase wartime production resulted in a 1940 barley crop of 45,800,000bu., unofficial estimate. The 1939 crop in England and Wales was 37,053,000bu. In Sweden the 1940 crop was 8,864,000bu.; that of 1939 was 11,494,000.

Agricultural statistics from other countries were not available because of wartime restrictions.

(S. O. R.)

Barnes, George Nicoll (1859–1940), Scotch labour leader, was born Jan. 2. He was elected to parliament as a Labour candidate from a Glasgow division in 1906 and served until 1922. He was a member of the war cabinet in 1917 and was minister plenipotentiary to the Paris peace conference in 1919. He was the author of several books on the labour movement. He died in London, April 22.

Barrère, Camille (1851–1940), French diplomat, was born at La Charité-sur-Loire in October, a grandson of one of the presidents of the national convention of the first republic. In 1880 he was the French delegate on the international commission for the regulation of the Danube. He was then appointed minister to Egypt and later represented France in Stockholm, Bucharest, Berne and Munich. In 1897 he was made ambassador to Rome, serving there for 32 years. He was influential in persuading Italy to abandon the triple alliance during the World War of 1914–18 and to join with France and Britain. When the Italian representatives left the peace conference because of dissatisfaction with the disposal of Trieste, he persuaded them to return. He thrice refused to enter the cabinet as minister of foreign affairs. He died in Paris, Oct. 8.

Basalt: see STONE.

Baseball. In attendance the American league reached a record with a season's gross patronage of 5,433,791 persons, far in excess of the National league figures which were estimated to be 300,000 short of the 1939 campaign. In the aggregate the combined attendance figures for both the American and the National leagues were placed in excess of 10,000,000. The growth in popularity of night baseball was undeniable. Playing under arc lights extended until ten of the 16 major league clubs booked night games. Another club was to join the experimenters in 1941, when the Washington Senators would install a lighting system. This will leave only the New York Yankees, the Boston Red Sox and the Detroit Tigers in the American league, and the Chicago Cubs and the Boston Bees in the National league, without lighting apparatus. The St. Louis Browns in the American league, by special legislation adopted by the league's directors, received permission to play 14 night games at Sportsman's park in St. Louis, an arrangement which proved highly profitable for the club and popular with the club's followers.

World Series.—Manager McKechnie of the Cincinnati Reds added to his year's laurels when his club won the world series in seven games, the first postseason interleague struggle to go the

maximum number of games since 1934. Detroit won the first game, 7 to 2, in Cincinnati before a crowd of 31,793 persons. Five runs in the second inning routed Paul Derringer, Cincinnati's opening pitcher, and gave Buck Newsom a victory he richly deserved. In the second game Bucky Walters rallied from a shaky start to fashion a 3-hit performance as his mates batted Lynwood (Schoolboy) Rowe out of the game in the fourth inning, picked up another run on Johnny Gorsica in the fifth, and won the game, 5 to 3.

The third game was played in Detroit before a crowd of 52,887 persons and resulted in a Detroit victory, 7 to 4, when home runs by Rudy York and Frank (Pinky) Higgins, each struck with a runner on base, broke a 1-all deadlock and decided the issue in the seventh inning. Before a crowd of 54,093 persons Paul Derringer came back in the fourth game, played in Detroit, to score the first world series triumph of his career, 5 to 2, limiting Detroit to five hits as Frank McCormick, Ival Goodman and Bill Werber led a Cincinnati assault on Paul Trout, Clay Smith and Archie McKain that squared the series for the second time.

Buck Newsom's father died suddenly of a heart attack after a quiet celebration following the Detroit pitcher's triumph in the first game. The husky right-hander had to forgo attendance at the funeral in Hartsville, S.C., because Detroit's hopes depended so completely upon his amazing pitching strength. But Newsom, putting aside his grief, came back to score his second victory in the fifth game, 8 to 0, limiting Cincinnati to three solitary singles in a game featured also by Hank Greenberg's third-inning home run with two mates on base and witnessed by 55,189 persons, the largest crowd of the series.

The scene shifted back to Cincinnati for the sixth game and Bucky Walters, allowing Detroit but five hits, pitched Cincinnati to victory, 4 to 0, contributing a home run to the attack that squared the series for the third time. In the seventh and final game, Paul Derringer scored his second triumph, 2 to 1, doubles by Frank McCormick and Jimmy Ripple accounting for two seventh-inning runs that ended an American league series reign dating back to 1935 and gave Cincinnati its first series championship in 21 years, or since the dark days of the 1919 Black Sox scandal. This victory also clinched for manager McKechnie of the Cincinnati club, known as "Deacon Bill," the unique distinction of being the first manager in baseball history to win a world series with two different clubs.

He won his first with the Pittsburgh Pirates in 1925. It was the third victory of the year for McKechnie over the American league. He had managed the National league team in a 2 to 1 victory over the American league in a training camp all-star game played in Tampa, Fla., March 17, in the interests of the Finnish Relief fund. He was also the manager of the National league team which conquered the American league in the all-star game staged in mid-season.

A total of 281,842 persons saw the seven-game series. The aggregate receipts amounted to \$1,321,817.84, including \$100,000 for the radio rights to the series, a new income record. The former record was \$1,304,399 by the New York Yankees and the New York Giants in 1936. The players' pool amounted to \$373,830.56, which compares with the \$380,117.84 pool for the 1939 series in which the New York Yankees beat Cincinnati four straight games. The discrepancy is found in the 80,000 seating capacity of the Yankee Stadium in New York.

The Season's Race.—Cincinnati's National league victory in the championship season was easily scored, in contrast to a bitter fight for supremacy in the American league. Manager McKechnie's team dislodged Brooklyn as leaders in the National league on July 7 and remained in front to the finish of the season, winning the pennant with a 12-game margin over Brooklyn. St. Louis was

HANK GREENBERG of the Detroit Tigers sliding safely into second after doubling in the fourth game of the 1940 World's Series. Joost of the Cincinnati Reds is just receiving the ball. Cincinnati won the series, 4 games to 3

third, 16 games back of the victors. Pittsburgh, Chicago, New York, Boston and Philadelphia finished in that order, Philadelphia 50 games off the pace. Cincinnati compiled a winning total of 100 games, the third National league club to attain the century mark since 1913. Not until Sept. 27, two days before the season was to close, did Detroit clinch the pennant in the American league. The Yankees, sliding most of the year, rallied and actually attained first place briefly on Sept. 11 when they won the first game of a double-header in Cleveland, marred by a vegetable shower from disgruntled fans. The Yankees dropped from the lead when they lost the second game which was limited to six innings because of rain, and faded thereafter. Cleveland's Indians, contenders for the pennant all year, suffered through internal strife. The Detroit club, playing smoothly as the Yankees and the Indians floundered, clinched the pennant amid a vegetable shower in Cleveland Sept. 27, Bobby Feller bowing to Floyd Giebell, a rookie right-hander who was not even eligible for the world series. Cleveland finished second, one game back; the Yankees third, two games away. Chicago, Boston, St. Louis, Washington, and Philadelphia finished in that order, Philadelphia 36 games away from Detroit.

The discharge of Charles Leo (Gabby) Hartnett as manager in a postseason shakeup of the Chicago Cubs in the National league and the engagement of Jimmy Wilson as his successor; the discharge of manager Vitt by the Cleveland club and the return of Roger Peckinpaugh, who had managed the club before the days of Walter Johnson, as manager, were outstanding personnel changes.

Comparative Statistics.—In the eighth renewal of the mid-season All-Star game, played at Sportsman's park, St. Louis, July 9, a composite team of National league players defeated a composite team of American league players by a score of 4 to 0. It was the third National league victory in the eight games played. The contest was witnessed by 32,373 persons and attracted receipts of \$42,420.79.

Hitting supremacy remained with the American league, especially in the matter of home runs. Batters in this circuit accounted for 883 home runs, while the National league players hit 688. The

Yankees led the American league with 155 home runs. Six clubs each hit in excess of 100 home runs. St. Louis led the National league in home runs with 119, the only club in this circuit to exceed the 100-mark.

The individual leaders in home runs were Johnny Mize of the St. Louis Cardinals with 43, and Hank Greenberg of the Detroit Tigers with 41.

The best all-around batting average for the season was made by a National league player, Debs Garms, of the Boston Bees. He finished with a percentage of .355. In the American league Joe DiMaggio of the New York Yankees was the batting leader. His percentage was .352, 29 points lower than his 1939 average. At the finish their standings were as follows:

	Games	At Bat	Runs	Hits	Percentage
Garms	103	358	76	127	.355
DiMaggio	132	508	93	179	.352

Feller's opening day no-hit, no-run game was the only such full-time game of the American league season. He had the league's finest pitching record. He also pitched a 1-hit game, a 2-hit game, three 3-hit games, two 4-hit games, appeared in more games than any other American league pitcher (43), pitched the most innings (320), faced the most batters (1,168), pitched the most complete games (31), shared with Ted Lyons (Chicago White Sox) and Al Milnar (Cleveland Indians) the distinction of pitching the most shutouts (4), and led the American league pitchers in winning percentages (.711), as well as earned run average (2.62). In the National league William H. (Bucky) Walters of the Cincinnati Reds again was the leader, with an earned run average of 2.48. Following are the comparative standings for the season for Feller and Walters, in games pitched, games credited as won, and games charged as lost:

	Games	Won	Lost	Percentage
Feller	43	27	11	.711
Walters	36	22	10	.688

The best won and lost record for the two major leagues was furnished by the 39-year-old Freddy Fitzsimmons of the Brooklyn Dodgers, who won 16 games and lost 2 for a percentage average of .889 in 20 games.

The Minor Leagues.—After beating the Baltimore Orioles 4 games to 3 in the International League's Governor's Cup final

play-off series, the Newark Bears won the "little world series" from Louisville, American association representative, 4 games to 2. It was the Bears' third victory in the annual series. In other minor league competition Nashville won the Southern association pennant and beat Houston, winners of the Texas league pennant, 4 games to 1 in the Dixie world series. Scranton again won the Eastern league pennant. For the second straight year Seattle won the championship in the Pacific Coast league.

College Baseball.—Losing but one game in 11, Cornell university won the Eastern Intercollegiate Baseball championship with a percentage of .909. Dartmouth, Columbia, Yale, Princeton, Harvard and Pennsylvania followed in that order. In the Western conference, Northwestern university and the University of Illinois tied for the championship, each with a record of 9 victories and 3 defeats and percentages of .750. Iowa, Minnesota, Michigan, Wisconsin, Indiana, Ohio State, Purdue and Chicago followed in that order. It was the first time Northwestern gained championship distinction. (J. P. D.)

Basketball. An estimated 90,000,000 persons attended college, school and club games in the United States during 1940. Fifteen intercollegiate double-headers played in Madison Square Garden, New York, attracted 212,672 spectators, with an average attendance of 14,178.

There is difficulty in ranking teams in their proper order, yet Colorado was picked at the top of the list because it won the third annual intercollegiate invitation tournament in New York and its third straight victory in the Rocky Mountain Big Seven. It lost, however, the divisional semifinal of the N.C.A.A. Indiana won the N.C.A.A. tournament, was runner-up to Purdue in the Big Ten conference, and excelled in 20 of its 23 games.

An unusual result in big-time games was the three-way tie between Kansas, Oklahoma and Missouri for the Big Six conference, after Kansas was eliminated in the finals of the N.C.A.A. Purdue did well in winning the Big Ten championship, the 13th time to share in or win the title. Southern California won the Pacific Coast conference and was runner-up to Kansas in Western N.C.A.A. play-offs. New York university was the Metropolitan (New York) champion, winning 18 out of 19 games. Dartmouth was champion of the Eastern league for the third year.

Other sectional leaders were Rice, winner of the Southwestern conference; Kentucky won the Southeastern conference; North Carolina led for the Southern conference.

The national A.A.U. championship was won by the Phillips Oilers team of Bartlesville, Okla., victors over the previous year's Denver Nuggets. Because players from 25 states were represented in this annual fixture, in Denver, sports writers and officials announced their selection of an All-American A.A.U. team, comprising five Denver players and four members of the Phillips team. The leading district association team of the A.A.U. was the Ohrbach A.A. quintet, of New York, Metropolitan champions.

Batista, Zaldivar Fulgencio (1901—), Cuban soldier and statesman and president of the republic since 1940, was a tailor's apprentice, agricultural worker and mechanic during his youth, and later managed a sugar cane plantation. He joined the national army in 1921 and the rural guard in 1923; later he was a clerk at staff headquarters. He took a prominent part in the various uprisings against Gerardo Machado's dictatorship from 1931 to 1933, and after the latter's downfall was appointed chief of staff of the army by the revolutionary government. In this office he became in effect the

dictator of all Cuba and thus governed the nation for seven years despite periodic promises of a popular election. In Dec. 1939, however, Batista announced that he would be a candidate in the presidential election of 1940.

A Socialist-Democratic coalition formally nominated him president April 7, 1940, and in the election on the following July 14 he defeated his opponent, Ramon Grau San Martin. Charges of voting frauds threatened to delay Batista's inauguration, but he was installed in office at Havana on Oct. 10.

Bauxite. An increasing demand for aluminium has stimulated the production of bauxite in a number of countries that were formerly only minor producers, particularly Yugoslavia, Hungary, Italy, Netherlands East Indies, Greece, and the Soviet Union, but has not yet materially affected the output of the other large producers; the increased output of the last two is largely for home consumption, but that of the first four goes largely to Germany.

World Production of Bauxite
(Metric tons)

World Total	2,185,000	1,017,000	3,750,000	3,850,000	3,900,000

On the average, about 60% of the output is used for metal, while the remainder goes into chemicals, abrasives, cement and refractories.

(G. A. Ro.)

Beans, Dry. The United States crop of dry beans in 1940 was estimated in October as 14,977,000 bags, uncleaned (100lb. to the bag). The 1939 crop was 13,962,000 bags and the ten-year (1929-38) average, 13,086,000 bags. Increased production was particularly marked in California, where a crop of 2,058,000 bags of lima beans and 2,954,000 bags of field beans was indicated, a 1940 total of 5,012,000 bags compared with 3,990,000 in 1939.

Beaverbrook, William Maxwell Aitken, 1ST BARON (1879—), British publisher and statesman, was born May 25, the third son of a Scotch Presbyterian minister stationed at Newcastle, N.B., Canada. Educated in the public schools of Newcastle while he peddled newspapers, he entered business and formed a successful merger that earned him a fortune. He went to London, entered politics and was elected member of parliament in 1910. He was with the Canadian expeditionary force in France in 1915 and later was officer in charge of Canadian war records. In 1918 he was appointed chancellor of the duchy of Lancaster and minister

of information. Meanwhile, in 1917, he had purchased control of the London *Daily Express*, a failing newspaper which by the 1930s he had converted into the largest daily in the world, with a circulation in excess of 2,500,000. Lord Beaverbrook, as he was known after 1917, also became publisher of the *Sunday Express* and the *Evening Standard*.

On May 14, 1940, he was named by Winston Churchill minister of aircraft production, and on Aug. 2 he was admitted to the war cabinet. Lord Beaverbrook began his new assignment with the typical energy that characterized his commercial ventures. On May 21 he ordered week-end labour for all aircraft factories and later he called upon all workers in aircraft industries not to desert their labours during air raids. In recognition of Beaverbrook's efforts to speed up the manufacture of British warplanes, Prime Minister Churchill declared that his minister had "worked magic" in producing planes for the royal air force. See also *Encyclopædia Britannica*, vol. 3, p. 282.

Bechuanaland Protectorate: see BRITISH SOUTH AFRICAN PROTECTORATES.

Beckham, John Crepps Wickliffe (1869-1940), former governor and U.S. senator from Kentucky, was born in Bardstown, Ky., Aug. 5, and was educated at the Central university. He was admitted to the bar while principal of the high school at Bardstown. In 1893 he was elected as a Democrat to the state house of representatives and was speaker in 1898. The next year he was elected lieutenant governor on the ticket headed by William Goebel. Goebel was later assassinated and the legislature declared that Beckham thereupon became governor. He was then elected to serve out the unexpired term and was elected again for a full term, serving until 1907. When he ran for the senate in 1908 he was defeated, but was elected six years later. In his later years he served as chairman of a commission to reorganize the state government and as chairman of the Kentucky Public Service commission. He was a delegate to the Democratic national conventions from 1904 to 1920, inclusive. He died in Louisville Jan. 9.

Bedford, Herbrand Arthur Russell, 11TH DUKE OF (1858-1940), was born in London, Feb. 19, and was educated at Balliol college, Oxford. He was lord lieutenant of the county of Middlesex from 1898 to 1926, aide-de-camp to King Edward VII and King George V from 1908 to 1920, and served in the regular army from 1914 to 1919. He had also served in the Egyptian campaign of 1882 and in India from 1884 to 1888. He died at Woburn Abbey, Aug. 27.

Beef: see MEAT.

Bee-keeping. Honey production in the U.S. in 1940 was privately estimated as substantially under the normal output of 160,000,000lb. but approximately 10% over the 1939 yield, while in Canada the 1940 crop was estimated as about that of 1939, which was officially reported at 11,500,000lb. compared with 16,000,000lb. in 1938. The U.S. department of agriculture does not make similar reports and, as the *American Bee Journal* points out, estimates are often little better than guesses.

Bee-keeping in the U.S.A. has been in a decline for several years, partly owing to continued low prices and partly because of decrease in bee pastures, particularly smaller buckwheat acreage.

National honey week was observed Oct. 28 to Nov. 2, 1940, as part of the effort carried on by national, state and local associations of bee-keepers to increase the consumption of honey. The American Honey Producers league held its annual meeting Oct.

THIS WHOLE HIVE of wild honeybees was caught for domestication in the summer of 1940 at Richmond, Mass.

22-24, 1940, at Omaha, Neb.

(S. O. R.)

Beer, Thomas (1889-1940), U.S. author, was born in Council Bluffs, Iowa, Nov. 22, and was graduated from Yale university in 1911. He studied law in Columbia university, but abandoned it for a literary career. His first short story was published in the *Century Magazine* in 1917. He served as a private, then as first lieutenant with the U.S. army in France in 1917-18. His first novel, *The Fair Rewards*, was published in 1922. His most successful book was *The Mauve Decade*, published in 1926. He wrote biographies of Stephen Crane and Mark Hanna. He was the master of a brilliant prose style for which he received much praise. He died in New York city, April 18.

Belgian Colonial Empire. The table on page 90 gives essential material relative to Belgium and the colonial and mandated territories administered by it. Total area 960,000 sq.mi.; total population (est. Dec. 31, 1937), 22,298,000.

History.—According to the colonial charter and to the Belgian constitution, the government of the Congo, in the absence of the king, should be exercised by his colonial minister and by the governor general. One of the first initiatives taken by the Belgian cabinet, after the collapse of France, was to send to London the colonial minister, M. de Vleeschauwer, with full powers to organize the resistance of the Congo in collaboration with Great Britain. From the beginning of July 1940 the position of the colony and its future contribution to the common cause were made perfectly clear.

The attitude of the governor general, M. Ryckmans, was no less resolute. In Sept. 1940 he was able to declare that the native army (15,000 strong in pre-war days) had been considerably reinforced, and that further measures were under discussion with the British military mission, recently arrived at Leopoldville. The strategic position was improved in Oct. 1940 by the contacts established with General de Larminat, governor of free French Equatorial Africa.

Other steps were taken, in conjunction with the British mission under Lord Hailey, to overcome the economic difficulties follow-

Belgium. Area 11,775 sq.mi.; pop. (est. Dec. 31, 1939), 8,396,276; chief towns (pop. Dec. 31, 1938): Brussels and suburbs (cap., 1,004,452); Antwerp (273,317); Ghent (162,858); Liège (162,229). Ruler: King Leopold III;

A REFUGEE FAMILY of Belgium in May 1940

prime minister: Hubert Pierlot; languages: French and Flemish.

History.—When war broke out, Belgium was governed by a coalition cabinet including representatives of the three principal parties, Catholics, Socialists and Liberals. At the previous elections the Rexist, who had totalitarian leanings, had been severely defeated.

Following the failure of the big powers to come to an understanding after the denunciation of the Locarno treaty by Germany (March 1936), public opinion had urged upon the government a policy involving that the army should only be used for the defence of the country's territory. This policy of non-commitment had been formally recognized in 1937 by Great Britain and France, and by the Reich. Belgium was released of her obligations under Locarno and undertook to strengthen her defences, the powers maintaining their guarantee against aggression.

The Belgian declaration of neutrality, in Sept. 1939, was therefore the unavoidable consequence of previous developments. From the first day of hostilities, 500,000 men were stationed on the eastern frontier which had been strengthened by defensive works, but neutrality prevented military arrangements with the Allies. No defensive alliance had been concluded between Belgium and Holland, but the two countries were brought close together by their common danger.

The only notification received of the German aggression was the aerial bombardment of Brussels on May 10. The government appealed at once for the military support of Great Britain and France, and the king who, according to the constitution, is placed in command of the national forces, left Brussels for his headquarters. The story of the stubborn resistance of the forts of Liège and Namur, and of the field army, compelled to retire with the British expeditionary force after the break-through at Sedan, is told elsewhere. (*See* EUROPEAN WAR.) It is generally recognized that, owing to the enemy's mastery of the air and to the Belgians' lack of supplies, the situation of the latter had become extremely critical from May 22, and that, when Weygand's counteroffensive failed to materialize, capitulation became inevitable. King Leopold's decision to accept defeat, taken on May 27, was bitterly attacked at the time, because the public was under the illusion that the military situation might have been retrieved and because the British and French commands had not received messages sent from Belgian headquarters. The king did not leave the country, but retired to his castle at Laeken. In the orders of the day in which he endeavoured to stimulate the resistance of his soldiers, he had promised to "share their fate." Between his duty as head of the state and as chief of the army, he chose the latter and preferred to remain with his people in their ordeal rather than seek refuge abroad. He afterwards observed the status of a prisoner of war and resisted all attempts made by the Germans to enlist his support.

Since the king refused to leave Belgium, his ministers used the

powers conferred upon them by the constitution and placed all the country's remaining resources at the disposal of the Allies. The prime minister, M. Pierlot, in his speech broadcast from Paris on May 28, declared that he and his colleagues intended to pursue the fight at the side of Great Britain and France and that their policy remained the defence of Belgian territory. After the debacle of the French armies, the situation became very difficult owing to the fact that over 2,000,000 Belgians, including thousands of men of military age, had fled to non-occupied France. The situation was aggravated by the uncertain attitude of the Vichy government. As soon as the repatriation of the refugees took place, M. Pierlot and his colleagues endeavoured to leave the continent, but they were detained by the Spanish authorities. They only succeeded in reaching England in October.

Fortunately two Belgian ministers, M. Gutt (minister of finance) and M. de Vleeschauwer (minister of colonies) were already in London. They had been given full power to organize the resistance in connection with the British authorities. Belgian financial assets had been transferred to London and to the United States at an early date. The Congo with its large resources in raw material, remained intact. Its position was consolidated by the attitude of the French colonies of Central Africa. There were also in Great Britain some Belgian soldiers evacuated from Dunkirk, and a small number of airmen who joined at once in the defence of London. Reinforcements could be found among the 15,000 to 20,000 refugees in England, including men of military age and skilled workmen. Gradually, these resources were brought together and took a share in the common effort.

The Belgians who remained in the country were at first discouraged by the lightning speed of the invasion. After the collapse of France, some believed that further resistance would be in vain, but the successes achieved by the R.A.F. and the constant bombing of military objectives in Belgium soon convinced the majority that the struggle was not over. The old spirit of 1914 revived, encouraged in some quarters by the uncompromising attitude of King Leopold, and in others by the powerful influence of the leaders of the church and of Socialist trade unions. At the close of 1940 there were already evident signs that the Belgians would once more oppose with stubborn energy the efforts made by their German conquerors to divide them or to undermine their patriotism by persecutions and privations. (E. CA.)

Education 1938.—Primary schools 8,712; scholars 955,038; higher schools 273; scholars 86,279; universities (1937-38) 4; students 10,776.

Defence 1939.—Army (inc. air force): 4,671 officers, 85,500 other ranks; mainly compulsory service (longest 17 months).

Banking and Finance.—Revenue, ordinary (est. 1940) 11,343,032,000 francs; expenditure, ordinary (est. 1940) 11,632,978,000 francs; public debt (Jan. 1, 1939) 57,334,571,000 francs; notes in circulation (Aug. 31, 1939) 26,496,000,000 francs; gold reserve (Aug. 31, 1939) 18,112,000,000 francs; exchange rate (average 1938) 28-93 belgas = £1 sterling; 5 francs paper = 1 belga.

Trade and Communication.—External trade (merchandise): imports (1939) 19,690,000,000 francs; exports (1939) 21,670,000,000 francs. Communications and transport: roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 156,762 ton mi.; mail mileage 78,412 ton mi.; newspapers 52,504 ton mi. Shipping (July 1, 1939) 408,418 net tons; tonnage launched (July 1938-June 1939) 27,600 gross tons; vessels entered, in net tons, (monthly average 1938) 2,497,000; (July 1939) 2,801,000; cleared (monthly average 1938) 2,502,000; (July 1939) 2,803,000; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; wireless receiving set licences

THE FAMOUS BELGIAN UNIVERSITY TOWN of Louvain was occupied by German forces May 16, 1940, after a thorough bombing

(1938) 1,082,200; telephone subscribers, local (1938) 287,323.

Agriculture, Manufactures, Mineral Production.—Production 1938 (in metric tons); wheat 547,874; oats 621,062; rye 385,033; potatoes 3,258,433; coal 29,575,500; pig iron and ferro alloys 2,464,800; steel 2,212,000; beet sugar 1,201,631; barley (1939) 89,230; butter 64,150; margarine 59,331; artificial silk 5,800. Industry and labour: industrial production (1929=100) (average 1938) 79.9; (June 1939) 80.7; number wholly unemployed (average 1938) 131,909; (June 1939) 150,921; partly (average 1938) 160,571; (June 1939) 151,540.

Benefactions: see DONATIONS AND BEQUESTS.

Benson, Edward Frederic (1867-1940), British author, son of a former archbishop of Canterbury, was born at Wellington College, England, July 24. He was educated at Marlborough school and King's college, Cambridge. After graduation he worked from 1892 to 1895 in Athens for the British Archaeological society and later in Egypt for the Hellenic society. In 1893 he published *Dodo*, a novel which attracted wide attention. It was followed by other successful novels and books on a wide range of subjects, totalling nearly 100. Among them were biographies of Queen Victoria, Gladstone and William II of Germany. In 1938 he was made an honorary fellow of Magdalene college, Cambridge. He died in London, Feb. 29.

Berlin-Rome-Tokyo Axis: see CHINESE-JAPANESE WAR; FASCISM; GERMANY; HUNGARY; ITALY; JAPAN.

Bermuda Islands. A British insular colony 580 mi. east of Cape Hatteras; language, English; capital, Hamilton (pop. 1,863); governor, Major General Sir Denis K. Bernard. The area is 19½ sq. mi. The March 26, 1939 census showed a population of 30,516 (not including 4,907 tourists and members of the military and naval forces), of whom Negroes constitute 62.9%. The colony has an appointed governor and an elected assembly.

The European war and its ramifications dominated the course of events in Bermuda during 1940, with far-reaching economic and other consequences. By the close of the year the colony had become a major centre of operations for prosecution of the war itself, as well as a potential one for future defence of the western hemisphere. Its location made it a logical point of union for convoys bound from North America to Great Britain; for similar

HAMILTON HARBOUR, Bermuda, viewed from the air. The United States on Sept. 3, 1940, acquired 99-year leases to build air and naval bases on this island and seven other British possessions in the Atlantic

reasons, it became an important station for examination, under the "navicert system" of neutral shipping bound to and from continental Europe. These activities, in their turn, required considerable enhancement of the naval and military establishments from a March 1939 personnel of 1,098 to several times that figure. In addition, between 600 and 800 censors were located at Bermuda to censor trans-Atlantic mail to and from enemy-controlled countries. Three of the leading hotels were commandeered to house this staff. While the customary tourist traffic was at a fraction of its former volume, unofficial sources estimated imperial expenditures in Bermuda to be in excess of £1,000,000 a year. These, along with the spending power of convoy personnel and more than 1,000 British refugees temporarily located in Bermuda, very considerably stimulated economic activity.

Of more lasting, but less immediate importance, was the leasing by the United States of naval and air bases on the Great Sound in Bermuda, as part of an agreement by which the United States traded 50 over-age destroyers for lease rights on these and similar bases in the British West Indies and elsewhere (*see WEST INDIES, BRITISH*). Contracts for construction work at these bases were let in the United States late in 1940.

Regular government-subsidized steamship communication with New York, replacing the former service by a British line, was maintained under the United States flag during 1940. Air service from New York to Bermuda and by the Pan American Airways' trans-Atlantic line, on which Bermuda is a regular stop, was maintained during the year although westbound stops on the latter were temporarily suspended following controversy over mail censorship.

In 1939, imports (chiefly foodstuffs, textiles and manufactured goods) totalled £1,750,536 (from the United States, 46.4%; Great Britain, 27.2%; Canada, 16.4%); exports, including re-exports, declined 20.5% to £115,656, of which £39,039 (13.33% less than in 1938) constituted domestic produce, chiefly cut flowers, lily bulbs and fresh vegetables. Following the outbreak of the European war in Sept. 1939, imports were sharply curtailed. From Jan.-April, 1940, imports aggregated \$1,798,784 U.S., supplied by the United States, Great Britain and Canada in roughly the same proportions as in 1939. Tourist expenditures normally offset the "unfavourable balance" between imports and exports. Under war conditions, tourist trade declined materially.

There are 30 government-aided schools, with an enrolment in 1939 of 4,670, or 15.3% of the whole population. (L. W. BE.)

Beryllium.

The amount of newspaper publicity given to beryllium in 1939 in connection with the hearings of the Temporary National Economic committee tended to give the general public an exaggerated notion of the importance of the metal. However, definite progress was being made in the commercial application of the metal, and demand was expanding. There were in 1940 two producers in the United States, one of which makes the pure metal, alloys and compounds, while the other produces the 4% master alloy (which is the form in which it is most used) and various fabricated products, such as rod, strip, wire and tubing. The master alloy is quoted at \$15 per pound of contained beryllium.

Beryl, the only ore used, is quoted at \$30 and \$35 per short ton f.o.b. mines for 10% and 12% ore, equivalent to \$45-\$55 at the consuming plant, but imported ore can be had somewhat cheaper, due to lower freight costs. U.S. imports were 459 short tons in 1939, while domestic production is estimated at 100-150 tons. (*See also METALLURGY.*) (G. A. RO.)

Bessarabia: *see* EUROPEAN WAR; MINORITIES; RUMANIA; UNION OF SOVIET SOCIALIST REPUBLICS.

Best, Sir Matthew Robert

(1878-1940), British admiral, was born June 18 and received his preliminary naval training on H.M.S. "Britannia." He rose through various ranks till he became an admiral in 1936. He served with distinction in the battle of Jutland in 1916. In 1927 he was chief of staff to the commander-in-chief of the Atlantic fleet and in 1929 he was in command of the second cruiser squadron of the same fleet. In 1934 he became commander-in-chief of the American and West Indies station. He died in London Oct. 13.

Besteiro, Julian

(1870-1940), Spanish socialist statesman, was for many years professor of logic and dean of the faculty of philosophy at the University of Madrid. During the widespread strike of 1917 he was sentenced to life imprisonment by a military court but the king pardoned him in response to popular demand and he was soon thereafter elected to the chamber of deputies. He was the first speaker of the cortes (1931-33) under the Spanish republic. He headed the council of defence which surrendered Madrid to General Franco in March 1939. In July of that year he was tried on the charge of prolonging the war, and on Sept. 4 he was sentenced to 30 years in prison. He died in the prison at Carmona, Sept. 27.

Bevin, Ernest

(1884-), British labour leader and statesman. In his youth he was a truck driver in the vicinity of Bristol; later he became interested in trade unions and was elected general secretary of the Transport and General Workers' union. In 1937 he was appointed chairman of the General Council of Trades Union congress. On May 13, 1940 Churchill named him minister of labour and national service, and he was promoted to the war cabinet on Oct. 3. In these offices he showed phenomenal energy in helping to stiffen Britain's war effort by securing the collaboration of the working classes. On May 25 he announced a great speed-up plan for war production and established the Labour Supply board. He was often referred to during the year as "Britain's next prime minister." Long an enemy of British aristocracy, he declared in a speech on Oct. 26 that poverty and privilege would be abolished after the war. But in the meantime he applied himself to the defeat of fascism, which he had denounced as more inimical than the "ruling classes."

Bielschowsky, Alfred (1871–1940), director of Dartmouth University Eye institute, was born in a Silesian village, Dec. 11. He studied medicine at the universities of Breslau, Heidelberg, Berlin and Leipzig, receiving his medical degree from the University of Berlin in 1894. After a period of military service he studied ophthalmology at Leipzig, where he became chief of a university clinic. He became an authority on motor anomalies of the eyes. After the World War of 1914–18 he founded the Educational Institute for Blind Academicians. He went to the United States in 1934 as visiting ophthalmologist at Dartmouth and was made director of the Eye institute in 1937. From 1938 he served also as associate in ophthalmology at the Harvard medical school. He died in Brooklyn, N.Y., Jan. 5.

Biggers, John David (1888–), U.S. industrialist, was born Dec. 19 at St. Louis and was educated at Washington university in that city and at the University of Michigan, where he received his bachelor's degree in 1909. After several years (1910–14) with the Detroit board of commerce and the Toledo, O. chamber of commerce he became assistant treasurer of the Owens Bottle company at Toledo, and had advanced to vice president by 1926, when he became managing director of Dodge Brothers of Britain, Ltd. in London. In 1930 he was named president of the Libbey-Owens-Ford Glass company in Toledo. In 1937–38 he directed the U.S. census of unemployed.

Biggers was named deputy commissioner under William S. Knudsen (*q.v.*) on the U.S. Council of National Defense June 5, 1940. His special concern was industrial production for armaments. When the Office of Production Management was created by President Roosevelt Jan. 7, 1941, Biggers became executive director of the production division for this new "super-defence" board.

Billiards. Willie Hoppe, approaching his 53rd birthday, made billiards history in the spring of 1940. Unprecedented, indeed, was his brilliant string of 20 consecutive victories in the gruelling competition for the three-cushion championship of the world at Chicago. Without the loss of a single game the veteran New Yorker regained the title he last won in 1936. Although he had a number of close calls, and several times had to come from behind to triumph, Hoppe's stroking was the most consistent ever witnessed in a major tournament. He captured one of the matches by a 50–49 score, two by 50–48 and two by 50–47. His high run for the tournament was 12 and his best game, or shortest number of innings required to end a match, was 25.

Pitted against the man who, at one time or another, has held every major billiard championship, were 10 of the world's outstanding cue artists, headed by Joe Chamaco of Sonora, Mexico, the 1939 winner. The others in the field included Welker Cochran of San Francisco and Johnny Layton of Sedalia, Mo., each a former titleholder in his own right. Jake Schaefer and Arthur Thurnblad, both of Chicago, Otto Reiselt of Philadelphia, Tiff Denton of Kansas City, Allan Hall of St. Louis and Arthur Rubin of New York were the other entrants.

Aside from the competition for the pocket billiards championship of the world, there was little other activity in the sport during 1940. The pockets laurels were captured by Andrew Ponzi of New York, who last ruled in 1934. This tournament, staged on a home-and-home basis in various cities, resulted in a close victory for Ponzi. By virtue of having won 51 matches and lost 29 Ponzi succeeded Jimmy Caras of Wilmington, Del., as champion, Caras,

having won one less and lost one more than Ponzi, finished in the runner-up position. Ponzi, incidentally, established a new high run record for championship play by putting together a cluster of 127 points in a single inning. (L. E.F.)

Biochemistry. Important advances were made in 1940 in the fields of vitamins, hormones and intermediary metabolism.

Vitamins.—Vitamin-K activity is necessary to prevent fatal haemorrhages in baby chicks if kept on a diet free from this activity. The activity is found in alfalfa and in putrefied fish meal. That found in alfalfa is called vitamin K₁ and the other is known as vitamin K₂. Both have been obtained in pure form and the former has been synthesized. Vitamin K₁ is 2-methyl-3-phytyl-1,4-naphthoquinone. Vitamin K₂, obtained from putrefied fish meal, was shown to be a 2,3-disubstituted-1,4-naphthoquinone of the empirical formula, C₄₁H₅₆O₂. A group of related 1,4-naphthoquinones was prepared and all possessed vitamin-K activity. These substances were found of value in the treatment of newborn children threatened with death from haemorrhage and similar dangerous haemorrhages in adults due to obstructive jaundice.

Pantothenic Acid.—This vitamin activity was discovered as an important yeast-growth stimulant. However, it probably also aids growth in mammals and man and may be of value otherwise. It not only aids growth in the chick and rat, but, more specifically, it prevents chick dermatitis and a special dermatitis in rats. It is necessary for the normal growth of yeasts and a number of bacteria. Its structure, which was determined by degradation studies, has been confirmed by its synthesis. It is the α -hydroxy- β -dimethyl- γ -hydroxy-butyryl- β -alanine.

Vitamin H.—This is the curative factor which protects rats from injury by too large amounts of egg white in their diet. The latest findings (1940) indicate that this factor probably is identical with another yeast growth-stimulant known as biotin. The structure and synthesis were not accomplished.

Human Needs of Vitamins in General.—As a result of the development of very delicate chemical methods for thiamin, nicotinic acid, tocopherol (vitamin E), vitamin C, pantothenic acid, and vitamin B₆, the medical profession is now able (1940) to determine the rate of excretion of these substances in the urine of normal and sick individuals, and thus may detect deficiency diseases in the early stages when the usual symptoms have not appeared. The remarkable finding is that the body is very wasteful with most of these important substances and hence a liberal excess is necessary in the diet.

Hormones.—Some progress was made in the purification of the many hormone activities found in the pituitary gland. This is particularly true for the thyrotropic (thyroid-stimulating), ovarian follicle-stimulating, luteinizing (corpus-luteum forming) and mammary-gland stimulating fractions. All these substances appear to be proteins. The gonadotropic material obtained from pregnancy urine appears to be a glycoprotein, that is, a protein rich in carbohydrates. The adrenotropic factor probably is the same as the diabetogenic factor. In other words, diabetes may be due to an overstimulation of the adrenal cortex with or without exhaustion of the pancreas in attempting to counteract the too active adrenals.

Use of Tracers or Labelled Atoms in Studying Intermediary Metabolism.—The use of radioactive forms or isotopes of phosphorus, hydrogen, nitrogen, carbon, etc., in tracing where and how these elements are utilized by tissues continued to yield results which in part confirmed conclusions arrived at by other methods, but also led to new and astounding findings. Thus, with radioactive phosphorus as the tracer in phosphorus metabolism it was concluded, (1) that marked changes in phospholipins take place in the kidney in attempts to counteract loss of base due to NH₄Cl poisoning; (2) that the function of phosphocreatine hydrolysis in muscular contraction is to supply base for the neutralization of lactic acid; (3) that phospholipid metabolism is most active in the rat at birth and then rapidly declines in activity; (4) that bone and tooth phosphorus is easily replaced by radioactive phosphorus and hence teeth and bone must always be undergoing exchanges with constituents from the blood; (5) that the liver is involved in phospholipin synthesis and that kephalin probably is formed from lecithin by demethylation. From the use of radioactive sodium it was concluded that the membranes of muscle cells are permeable to sodium. By means of radioactive carbon supplied in the form of carbon dioxide or bicarbonate it was shown that not only plants, yeast and bacteria can utilize carbon dioxide in the synthesis of organic compounds, but it also was shown that liver tissue can utilize the carbon dioxide in the formation of α -ketoglutaric acid. Studies with heavy nitrogen-containing compounds indicated that sarcosine must be easily demethylated in the rat and then utilized like glycine in the transfer of heavy nitrogen to form other amino acids, ammonia and urea. By feeding heavy nitrogen in the form of guanido-acetic acid to rats, it was shown that creatine is formed therefrom. In the field of fatty acids, the feeding studies with heavy hydrogen-containing fatty

acids or the corresponding alcohols led to the remarkable conclusion that palmitic acid not only is converted into the unsaturated palmitoleic acid, but also into stearic acid which contains two carbon atoms more per molecule than palmitic acid. The results also indicate that long chain alcohols like cetyl alcohol are in equilibrium in the body with the corresponding fatty acids. (See also *PHYSIOLOGY*.)

Bird Refuges. There were (Jan. 1, 1941) 263 refuges for all forms of wild life, administered by the Fish and Wildlife service,¹ aggregating 13,595,812ac. All but 16 of these (4,094,202ac.), which were situated in Alaska, Hawaii and Puerto Rico, were in the United States. Of the total, 250 (6,595,997ac.) were primarily for birds and 13 (6,999,815ac.) were primarily for big game, but wild life in general was accorded protection on all refuges. Among important additional refuges acquired during the year 1940 were the Susquehanna Migratory Waterfowl Closed Area, in Cecil and Harford counties, Maryland, embracing 21,210ac. It is an excellent resting and feeding ground for ducks. At least 300,000 canvasbacks concentrated there. The Noxubee National Wild Life refuge, in Winston, Noxubee and Oktibbeha counties, Mississippi, containing 38,239ac., provides a haven for wild turkeys as well as waterfowl and other wild life. The Bosque del Apache National Wild Life refuge, in Socorro county, New Mexico, is noteworthy as a breeding ground for the rare New Mexican duck.

More than \$1,111,000 were made available by hunters during the fiscal year ended June 30, 1940, for the continuance of the migratory-waterfowl restoration program through the sale of migratory bird hunting stamps as provided for under the Migratory Bird Hunting Stamp act (49 Stat. 379). Ninety percent of these funds are used for acquiring, developing and administering refuges for migratory waterfowl, and 10% for the enforcement of laws for the protection of migratory birds and the expenses of the post office department in engraving, issuing and accounting for the stamps.

Certain bird refuges were established by the Fish and Wildlife service for the special protection of some species threatened

¹The Bureau of Biological Survey and the Bureau of Fisheries of the department of the interior were combined under the new designation *Fish and Wildlife Service*, effective July 1, 1940.

TRUMPETER SWAN on the Red Rock Lakes national wildlife refuge in Montana. In the early 1930s many persons believed this bird was extinct; in 1940 more than 200 of the species were counted at the Red Rock Lakes refuge and in Yellowstone national park

with extermination. Among those of this type are the Red Rock Lakes refuge, Montana, for the perpetuation of the trumpeter swan; Great White Heron refuge, Florida, for the great white heron; and the Aransas refuge, Texas, for the whooping crane. The number of trumpeter swans in the United States increased from 115 in 1936 to 212 in 1940, of which 128 were on the Red Rock Lakes refuge. There were in 1940 more than 1,000 great white herons on the Great White Heron and Key West refuges, whereas there were only about 600 in 1938.

Waterfowl and other wild life on the national wild life refuges showed a substantial increase in numbers in 1940 which was the fourth consecutive year, as a result of improved water, food and cover conditions and more adequate protection. There were 900,000 ducks and geese present on the Tule Lake refuge, California, in mid-October, more than have been observed at that season for many years. Some species not previously seen on the refuges were observed. Sandhill cranes stopped for the first time in the fall of 1940 on the Lower Souris refuge, North Dakota. Fulvous tree ducks nested on the Lacassine refuge, Louisiana, establishing a new breeding record for the refuge and one of the few for the state. A pair of king rails with 12 young was observed on Big Lake refuge, Arkansas, where the species had not previously been recorded. Eight species of birds were seen on the Aransas refuge, Texas, for the first time during the summer. Among these were the purple gallinule, clapper rail and Cabot's tern. (E. A. G.)

Birth Control. With the outbreak of the war in 1939, the continued drive of the totalitarian nations for increased population and the subjugation of the democracies where birth control programs had been in progress, not only did activities cease in large part in those countries, but with the rigid censorship no news on what was transpiring filtered through.

The forced migration of millions of people in Central Europe, the starvation of millions more, the separation of families, with great bodies of troops either in movement or at the various fronts and away from home, all acted as a form of birth control. The malnutrition extending over large areas in Europe will affect fertility adversely during and after the European war. With these factors will come the fear of depopulation which manifested itself before the war. It is to be hoped that there will also follow increased recognition of the need for intelligent and honest efforts to solve the problems of population pressure, especially those dealing with population distribution in relation to national resources. Without such solution, a lasting peace can never be

achieved for these causes are basic reasons for aggression.

Emphasis in the United States birth control movement was, in 1940, on the need for expanding birth control services as a means of strengthening the physical and economic well-being of the nation as it planned for national defence.

Australia.—Birth control clinics continued to operate in Australia, but mothers in the low income group were given a maternity bonus of \$20 on the birth of each child and in New South Wales a small weekly payment for each child after the first.

Cuba.—In Havana, films dealing with the "Technique of Contraception" were widely presented to the medical profession and the leading medical associations. There is particular interest in the birth control program of its neighbouring island, Puerto Rico, where efforts to solve similar problems of overpopulation have been under way for several years.

England.—Activities of the Family Planning association continued in Great Britain up to the outbreak of the war. Birth control clinics still functioned. The clinic of Dr. Marie Stopes, the first established in London, was bombed in an air raid in Oct. 1940 and partly demolished.

France.—The new code which went into effect late in 1939, not only provided new and drastic regulations against abortion, but prohibited the advertising of contraception. Because of censorship of everything published, including even a discussion of contraception, *La Grande Reforme*, the French Neo-Malthusian journal, edited by Eugene Humbert, suspended publication late in that year.

Following the conquest of France, Jean Ybarnegaray, minister of youth in the Vichy government, announced a new policy to stimulate the birth rate. The young women of France will be educated for one purpose only! "To return to their traditional purpose of life—being in their homes and living only to raise strong useful men." Fathers of families will be given preference over bachelors in both public and private employment and will be paid in proportion to the size of their families.

Germany.—Germany continued an uncompromising opposition to any form of birth control. In Dec. 1939, a new population policy was officially announced. All soldiers going to the front were expected to leave children or prospective children behind them.

Since the outbreak of the war, censorship in Germany has resulted in a complete cessation of all statistical material on population.

Holland.—New birth control clinics were opened in Amsterdam and Enschede, both in industrial sections where many factory workers live. This progress took place prior to the invasion of Holland. After that, no news was received.

India.—The All-India Women's conference, which met in Allahabad in Jan. 1940, adopted a new resolution on family planning which urged that women medical officers in municipal and government hospitals, dispensaries and health centres advise married women on child spacing and that the technique of contraception be taught these officers.

The National Planning commission appointed by the National congress passed a resolution that family planning and limitation of children were essentials in the interest of national economy and urged the state to adopt a policy encouraging the establishment of birth control clinics and other necessary measures to encourage the spread of cheap and safe methods of birth control.

Japan.—Japan's official pressure for a higher birth rate during the Sino-Japanese war resulted in an increase in the rate of infant mortality. Coupled with the demand for an increase in population, as a patriotic duty during the war, suppression of birth control clinics and of discussion of birth control continued.

New Zealand.—The Sex Hygiene and Birth Regulation society of New Zealand dissolved during 1940 to re-form as the Family Planning association, affiliated with the British organization. A deputation of workers from the association in conference with the ministry of health requested that contraceptive advice be given by physicians, when necessary, at state maternity hospitals.

Puerto Rico.—With the legality of contraceptive advice, under medical direction, established in Puerto Rico by legal decision in 1939, clinic services have been established under the supervision of the Puerto Rico board of health. The Asociacion pro Salud Maternal e Infantil de Puerto Rico, under the medical direction of Dr. J. S. Belevall, continued its educational and research efforts to determine the type of contraceptive best adapted for use on the island. Public interest in the medical and public health aspects of birth control were stimulated by a visit from Mrs. Sanger in 1940 and the medical films on contraception were being widely shown among scientific and medical groups.

Sweden.—The new population measures instituted in Sweden which went into effect Jan. 1, 1938, based on the principle that voluntary parenthood and a positive population policy must be brought together, were in their second year. This policy emphasizes that only children welcome to their parents are wanted by the nation; but it also recognizes that certain social conditions must be rearranged so that more children can be welcomed. Birth control services were widely extended to reach all groups of society, but to reduce the economic motive for extreme family regulation, a series of measures, involving not cash premiums to parents but health and environmental services benefiting the children themselves, were put into effect. Hence skilled labourers and artisans in Swedish cities are having more children than the unskilled. It is to be hoped that the war will not destroy Sweden's interesting and historic experiment.

United States: Clinics.—The growth of birth control centres in the United States continued. On Nov. 1, 1940 these totalled 589, of which 106 were in hospitals, 178 in health departments and 305 in other quarters, largely extramural. Of these centres, 206 were supported wholly or in part by public funds.

Human Fertility.—In Jan. 1940 the *Journal of Contraception*, published by the medical department of the Birth Control federation, changed its name to *Human Fertility*, as more truly expressing its contents.

Field Work.—Representatives of the Birth Control Federation of

America, Inc. co-operating with various health agencies, extended birth control services to underprivileged mothers in 11 states not yet ready to undertake state-wide programs under their health departments. The services were medically supervised and simple contraceptives were advised.

U. S. Population Policies.—Wide attention was given to a report by the Population committee of the National Economic and Social Planning association which advocated "Provision for scientific information concerning appropriate methods of contraception for all potential parents is an essential measure for sound population policy."

Special Negro Project.—The federation, through a special grant of funds, established a division of Negro service, sponsored by a National Advisory council which included Negro leadership in all fields. Two special Demonstration projects were established, one in Nashville, Tenn. and one in Berkeley county, S.C., to study the effects of medically directed contraception upon the health and welfare of the Negro populations of those sections. The Urban project in Nashville is under the direction of the City Health officers and the Rural project will be supervised by the chairman of the Committee on Maternal Welfare of the South Carolina State Medical association.

Legal Action.—The Federal Trade commission was active during 1940 against false claims for a number of commercial contraceptives. Cease and desist orders were issued against some and suits instituted against others. Such government action was welcomed by the organized movement for birth control, as a step in regulation of the bootleg traffic in undependable contraceptives.

Legal Decisions: Connecticut.—On March 21, 1940, the Supreme Court of Errors of the State of Connecticut, by a vote of 3 to 2, handed down a decision patterned on that in Massachusetts in 1938. The Connecticut decision upheld the existing statute and ruled that under it, it was illegal for a physician to prescribe, or a patient to use, contraceptives, even where definite medical indications existed. Connecticut is now one of the only two states in the Union where a doctor is forbidden to advise a patient on contraception and remains the only state where the use of contraceptives is illegal.

Iowa.—A decision in a suit brought against a druggist in Iowa, in 1937, was handed down by the supreme court of that state in 1939. The druggist was accused of violating the law by distributing a pamphlet entitled "Birth Control." The court ruled him not guilty because the code of laws of the state specifically exempted medical schools, physicians and druggists from the provisions of the act governing distribution of contraceptive literature or materials.

Massachusetts.—While previous court decisions declared it illegal for a physician to give contraceptive information under any conditions, the decision of the Massachusetts supreme court, Sept. 17, 1940 by a vote of 3 to 1, reversed a former ruling and declared a pharmacist not guilty in selling certain articles for the prevention of conception because there was no proof they were to be used for the prevention of conception. This decision added to the existing legal confusion in Massachusetts, making it possible for bootleg traffic in questionable contraceptives to flourish, while legitimate medical contraceptive service remained outlawed. An Initiative Petition distributed by the Massachusetts Mothers Health council to amend the statutes involved was filed with over 45,000 signatures, though only 20,000 were legally required.

State Birth Control Federations.—There are now 32 organized state birth control organizations co-operating with the Birth Control federation. D. Kenneth Rose became executive vice-president of the federation in 1940 and Woodbridge E. Morris, M.D., former director of the division of Maternal and Child Health of the Delaware state board of health became general medical director. (M. Sr.)

Birth Statistics. Provisional reports show that there were 2,262,726 births in the United States during 1939 and that the birth rate was 17.3 per 1,000 total population. Canada, in 1939, recorded 229,063 births and had a birth rate of 20.3 per 1,000. In the same year there were 620,257 births in England and Wales, the birth rate being 15.0 per 1,000. White persons in the United States in 1938 had a birth rate of 17.2 per 1,000, while that for Negroes was appreciably higher, namely 20.9 per 1,000.

Birth rates for the principal countries for the latest year available are shown in the appended table. Countries with birth rates as low as 16 per 1,000 or less are: Belgium (15.6 in 1938); England and Wales (15.0 in 1939); France (14.6 in 1938); Norway (16.0 in 1939); Sweden (15.3 in 1939) and Switzerland (15.2 in 1939). Most of the countries with birth rates of 20 per 1,000 or less are in western Europe. Birth rates are still high in many countries of South America and Asia. Thus, countries with birth rates of more than 30 per 1,000 are: Chile (35.2 in 1939); Colombia (32.1 in 1938); Venezuela (36.9 in 1939); Mexico (40.4 in 1939); British India (34.1 in 1938); Palestine (38.1 in 1939) and Egypt (43.4 in 1938). Birth rates as high as these would undoubtedly be found in many populous countries which have no adequate system for recording births. It has been generally observed that countries with high birth rates also have high death rates (see DEATH STATISTICS) and high infant mortality (see INFANT MORTALITY).

Annual Birth Rates per 1,000 Total Population in Certain Countries for 1939 and for Each Year in the United States from 1915 to 1939 and in England and Wales from 1900 to 1939

Country	Birth Rates per 1,000 in 1939	Year	Birth Rates per 1,000	
			United States (b)	England and Wales
North America

(Whites)	25.4	1939	17.3	15.0

(a) Birth rate for 1938.

(b) Official data begin with 1915. For years prior to 1933, the birth rates relate to an expanding area within the United States.

Within the United States, the birth rates are highest in the southwest and lowest in the northeast. Thus, New Mexico in 1939 had a birth rate of 27.3 per 1,000; Arizona, 22.2; Utah, 23.9 and Mississippi, 23.8; while New Jersey had 13.6, Connecticut 13.8, Massachusetts 14.7 and New York 14.1.

The rapid decline in the birth rate which most western countries have been experiencing for several decades now appears to have been halted.

Thus, the birth rate in the United States has been hovering at a level of about 17 per 1,000 in the period since 1932; at the same time, the birth rate in England and Wales has been fluctuating about a rate of 15 per 1,000. On the other hand, the birth rate in Germany has moved up rapidly from a low point of 14.7 per 1,000 in 1933 to 20.3 in 1939. This is undoubtedly the result of measures undertaken by the National Socialist regime of that country to stimulate marriages and large families. However, the countries engaged in the European war will undoubtedly experience low birth rates in 1940.

When birth rates are computed as a rate per 1,000 women of a given age in the population, they are then known as age-specific fertility rates. Thus, for white women in the United States in 1938, the fertility rates per 1,000 were: ages 15 to 19 years, 42.8; 20 to 24 years, 123.0; 25 to 29 years, 112.0; 30 to 34 years, 75.2; 35 to 39 years, 43.6; 40 to 44 years, 14.7 and 45 to 49 years, 1.4.

An analysis was made of the trend of age-specific fertility rates in the United States for the period from 1920 to 1938. It was found, in the first place, that the fertility rate for women of ages 15 to 19 years showed a greater stability than at the higher ages. Before 1926, the fertility rate was at a maximum

in the age group 25 to 29 years, but, since then, the maximum has been in the age group 20 to 24 years. Fertility rates for each of the age groups 15 to 19 years, 20 to 24 and 25 to 29 reached a minimum in 1933 and then showed a tendency to move upward. This tendency was very marked in the age group 20 to 24 years. However, the fertility rates for each of the quinquennial age groups after age 35 continued downward, with only occasional interruptions from 1920 through 1938.

A report showed that one-eighth of the births in the United States during 1935 were without medical attention; however, nine-tenths of the births without medical attention were attended by midwives. (See also CENSUS, 1940.)

Blitzkrieg: see LIGHTNING WAR; STRATEGY OF THE EUROPEAN WAR.

Blockade. Blockade is, in its generally accepted usage, the process by which a belligerent controls the ingress and egress of trade to a belligerent. It may involve control of neutral ships bound for neutral ports wherein the doctrines of "ultimate destination," "ultimate consumption" or "substitution" are involved. International law does not recognize a blockade as legal unless it is rendered effective by force. Furthermore, by law, a blockade must be effective in order to be binding. A "paper" or ineffective blockade has no legal status in the law of nations. Strict interpretations of law were soon disregarded in the World War of 1914-18 and in 1940 the law of nations was more honoured in the breach than in the observance. The rights of visit and search, seizure, and contraband cargo were closely associated with the practice of blockade.¹

In early days, blockade was maintained by a close blockade and reached its perfection in the wars of Great Britain against the French revolutionary governments and those of the French empire. The blockade of the south by the northern navy in the American Civil War was a major factor in the outcome of that war. The maintenance of an effective sea blockade by Great Britain of Germany from 1914 to 1918 literally starved the civil populace of the Central Powers and did much to effect an Allied victory. Great Britain had in 1940 the stupendous task of attempting to maintain a blockade of practically all the continent of Europe. It was the largest scale operation British sea power ever attempted in its long history, for the British fleet was confronted with strong air power and aggressive submarine warfare based on nearby continental ports.

In time, the close blockade of other days was challenged by the advent of new weapons, the mine, torpedo and submarine. In the war of 1940, the aeroplane was another new weapon that fought surface craft both in the close and long distance blockade. In fact, the tactical or close blockade was seriously questioned as to its effectiveness after the Russo-Japanese War, when Admiral Togo, the Japanese admiral before Port Arthur, lost two battleships by mines. This was one-third of his major force and forced Togo to relinquish his tight grip on the port. The first long range naval blockade was instituted at the outbreak of the World War of 1914-18, and with modifications was the type employed by Great Britain in 1940. Britain, Dec. 1940, maintained a long range strategical blockade with surface vessels, a close blockade when possible with submarines and employed bombers to destroy docks,

¹All assertions or opinions contained in the above article are the private ones of the writer and are not to be construed as official or reflecting the views of the navy department or of the naval service at large.

jetties and harbour facilities that could be used by Germany and Italy. After the fall of France, capital ships were also used on occasions to bombard ports held by Germany and Italy. Although a long range blockade existed in 1940, the change in the military-naval situation effected by the German occupation of North sea, English channel and Atlantic ports forced the royal navy to weaken its blockade in order to detach ships for other duties.

British sea power at the outbreak of the war commenced to exert an economic pressure by blockade that has been defined as 'an act of war carried out by the warships of a belligerent detailed to prevent access to or departure from a defined part of the enemy's coast.' The British Isles occupy a favourable position to permit her superior sea power to control and dominate the lines of sea communication bordering on the North sea and the channel ports. But with the fall of Norway, Denmark, the Low Countries, and German control of leading French ports, the British Isles have been forced to meet German sea and air power at short range. This changed situation affected the British blockade of the continent because of the sea and air force that she was compelled to mobilize in proximity to the British Isles to meet a threatened German invasion. This counterblockade by mines, aeroplanes, submarines and torpedo motor boats on the part of Germany rendered the British blockade less effective but the royal navy and the royal air force maintained the blockade and patrol to a surprising degree.

The British patrol and blockading squadrons went on stations Sept. 3, 1939. Great Britain did not declare a formal blockade but issued on Sept. 3 a proclamation of lists of contraband that covered practically all imports to Germany. The term "blockade," as used in 1914 and in 1940, is technically wrong in a strict legal interpretation because in its present usage it denotes the machinery employed to bring economic pressure on the enemy. On Sept. 9, 1940 the British government stated that "to prevent contraband from reaching the enemy, His Majesty's government will use their belligerent rights to the full."

Blockade, or the control of neutral shipping to enemy ports or contiguous areas, requires a highly organized machinery in the modern accepted version of "economic warfare." Before the World War of 1914-18, neutral ships were searched for contraband by blockaders at sea. Under modern conditions of war, with enemy submarines at sea, Great Britain found it exceedingly dangerous to stop men-of-war at sea for the purpose of examining the cargoes of merchantmen. In the World War, vessels suspected of carrying cargo that would reach Germany even indirectly were sent to designated British ports for inspection. Such ports are called control ports. For example 48 neutral ships were held on Dec. 26, 1939, at three contraband inspection ports in the United Kingdom. Since there is scarcely any shipping to the once neutral European countries now occupied by Germany, the control ports have lost much of their importance within the year 1940.

At the beginning of the war in 1939, Great Britain inaugurated the ministry of economic warfare with a complete staff from the civil service ready to function in a few weeks. This department was called in 1915 the ministry of blockade. All contraband comes under the admiralty marshal until a prize court sits and decides the ultimate destination.

Neutral ships may receive from British control ports and authorities in large neutral ports navigation certificates, called "navi-certs," which attest that the cargo is free of contraband. "Navi-certs" provide a means of obviating inspection when ships are boarded by British blockaders on the high sea. It is a "pass" through the blockade.

BRITISH SEIZURE of 235 bags of mail aboard the U.S. liner "Manhattan" at Gibraltar Jan. 7, 1940, provoked a sharp note of protest from the department of state

On April 9, 1940, Germany occupied Denmark and commenced the occupation of Norway. This had a serious effect on the British blockade of that area. On May 21, Germany began to occupy French channel ports and thereby pushed their bases closer to the British blockading squadrons. This marked the beginning of an effective counterblockade that continued throughout 1940. In Aug. 1940 Winston Churchill told the house of commons:

"It is our intention to maintain and enforce a strict blockade not only of Germany, but of Italy, France and all other countries that have fallen into the German power.

"There have been many proposals founded on the highest motives that food should be allowed to pass the blockade for the relief of these (conquered) populations. I regret that we must refuse these requests."

The refusal of the British government to permit food deliveries of Red Cross or other organizations to the people of Europe under German domination remained the policy in Dec. 1940. The British maintained that any relaxation of the blockade to permit passage of sea carriers with food for the ravaged lands of Europe would greatly assist the axis cause. Experts predicted that a near famine would prevail in parts of Europe for the winter of 1940-41. To achieve famine and hunger is the ultimate goal of a blockade for thereby the morale of a starving nation at arms may be undermined. A successful blockade hastens the decision; thereby does sea power with its air arm exert maximum pressure for victory.

Churchill's statement was a reply to the official German declaration of Aug. 17, 1940 announcing a total blockade of the British Isles. The nazis in a strong denunciation of British sea warfare and protesting the British declaration that foodstuffs were contraband, continued:

"The Reich government, therefore, has now decided to retaliate in kind and to employ armed forces with the same ruthlessness against shipping around England. . . . The unsuccessful British attempt to starve German women and children through a hunger blockade is answered by Germany with the complete blockade of the British Isles here proclaimed."

In 1915, the economic blockade enforced by superior sea power began to take effect on Germany. This hastened the first German declaration of submarine warfare which stated that from Feb. 18, 1915, onward, all hostile merchant ships met in British or Irish waters would be sunk without regard for the crew or passengers. Then, when the blockade by Britain grew more effective and the need in Germany for commodities and strategical war materials became pressing, the Kaiser on Jan. 19, 1917, issued the following order: "I hereby order unrestricted submarine warfare to be commenced on February 1st and to be prosecuted with the utmost energy." This declaration led directly to the torpedoing of American ships under the American flag which in turn so incensed public opinion that diplomatic relations with Germany were severed and in time the United States entered the World War. The United States then assisted in the blockade of the Central Powers, although on many occasions in the previous two years the United States had strongly objected to the seizure by the British and to condemnation of United States cargo consigned to neutrals near Germany.

In 1940, the British maintained combination blockading, bombarding and bombing forces. The blockading line was drawn perilously thin in some places in its long stretch from Iceland and northern Norway to Gibraltar. The royal navy held in 1940 a firm control of the Mediterranean. Major units remained concentrated in the search for Italian naval units. In Nov. 1940 a successful raid was carried out by a squadron of British ships on the Italian navy at Taranto, one Italian battleship was critically damaged while two more received hits that necessitated long overhaul periods. The damage was done by British sea-based aircraft. British naval strategy in the Mediterranean was to maintain as close a blockade as possible of Italy, bringing the Italian navy to action whenever possible. In a general sense the Mediterranean is blockaded as long as the British retain control of the important

strategic positions of Gibraltar and the Suez canal.

Britain will continue to use sea and air power to crack the axis at its weakest link—Italy. Britain may in time move in to closer blockade of Italy. Only shore-based aircraft and submarines prevented this in 1940. British soldiers were fighting with the Greeks in Albania, while British airmen established air bases in Crete and Greece. The royal navy by the end of 1940 had sunk or captured six of the seven Italian submarines based in the Red sea and was making every effort by blockade and patrol to prevent supplies reaching Italian troops in Albania and northern Africa. However, a German thrust to Gibraltar through Spain or to the Dardanelles through southeast Europe would seriously affect the grip of Britain on the Mediterranean. If the major portion of Italian sea power were destroyed, British cruisers and possible battleships would be released for much needed convoy duty in the Atlantic.

The outcome of the war may well depend upon the tightness and efficiency of the British blockade or the efficacy of the German counterblockade.

In counterblockade, Germany and Italy employ submarine aeroplanes, motor torpedo boats and surface raiders. All of this compels the release of British men-of-war for convoy duty. The British Isles, always dependent upon sea-borne commerce, require more foodstuffs and strategic raw materials in war than in peace. The serious challenge to British shipping in 1940 compelled the country to draw ships and planes from the blockading squadrons to meet the menace as well as employ air power to bomb the German occupied ports. To stop foodstuffs and war materials from going to an enemy is the prime object of all blockade. Both Britain and the axis were in 1940 vigorously fighting to this end at sea.

What has been the effect of Britain's blockade of the European continent? There is no doubt that there was a lack of food and raw materials in Germany and Italy in 1940. Berlin reports were optimistic over the food situation although rationing was stricter there than in Great Britain. In Germany it was officially stated that horse meat and dog meat would be official foodstuffs. The reich also experienced a shortage of steel and strategic raw materials. The oil deficiency, it appeared, would be relieved by the occupation and dominance of Rumania.

Italy felt the pinch in a definite shortage of oil and gasoline. The axis powers will of course exchange commodities but it is considered that Italy, with a lack of strategic war materials, has greater cause for future worry if the British fleet retains control of the Mediterranean.

The blockade, convoy duty and patrol of the waters of the world were in 1940 maintained by the British at a great cost and sacrifice in lives and ships. There have been sunk since the beginning of hostilities in 1939 some 3,800,000 tons of British, Allied and neutral shipping up to Nov. 9, 1940. About 400,000 tons of British ships flying the man-of-war ensign have been sunk since the beginning of the war. Aside from the ships lost, the badly needed cargoes also go to the bottom. Sinkings rose from a monthly average of approximately 200,000 tons to 400,000 tons.

Merchant ship losses have been serious but not critical. Great Britain, to a large extent, abandoned the English channel as a merchant ship route to London as well as St. George's channel to western English ports and routed much cargo north of Ireland. In 1938, Britain, in a treaty with Ireland, gave up her naval base at Lough Swilly, Berehaven, and Cobh which means that convoys must go 200 to 400 mi. farther for fuel and repairs. Up to the close of 1940, Britain strictly respected Irish neutrality.

In order to counterblockade and destroy British ships, Germany for nearly a year effectively utilized magnetic mines. This menace was met by invention of ship devices to neutralize the mine and the use of positive mine-sweeping measures. A serious

threat to British sea power was brought under control. The Germans, using Brest and Lorient, France, as bases mined the approaches to the English channel. The channel itself is a "no man's land" for general shipping. Large calibre artillery, "Big Berthas" and "Big Toms," bombarded the shores from both sides. Because of mines, bombardment and repeated bombing attacks most of the channel ports were in shambles and could be used only by shallow draught vessels such as motor torpedo boats and small submarines. The Germans used Boulogne and Cherbourg in 1940 as ports for naval operations against British convoys and blockaders.

The aeroplane proved to be a valuable weapon in blockade and counterblockade. Britain used her air power to strike at German ports with military objectives such as factories, shipyards and shipping. The Germans made reconnaissance of British shipping with planes and then sent bombers or submarines to make the attack. This co-ordination of weapons was a major reason for the rise in British tonnage lost. The grim war of attrition continued with Great Britain making urgent requests on the United States for planes, supplies and ships.

In past wars Britain could blockade countries in Europe and still trade for important commodities with neutral countries of the continent. In 1940 this was not so because of German occupation of much of Europe. Britain was compelled to go to South America or North America for much needed bauxite, iron ore, copper, wood, nickel, tin, cheese, fats and eggs. This required long voyages, convoys and escort ships for protection. But as long as Britain can maintain command of the sea, hold her bases and keep her homeland free of the foe she will remain a formidable power.

In short, superior sea power and one of its most potent manifestations, the blockade, was in 1940 holding its own. The royal navy and the royal air force stood between the British empire and defeat. If and when Britain attained a measurable air superiority over her enemies then the sea blockade would be definitely more effective.

Germany had by the close of 1940 "taken over" more countries for economic and strategic reasons and indicated a thrust to the near east for the purpose of securing control of the eastern Mediterranean and Britain's "life line of empire," the Suez canal. If the axis powers could secure the near eastern oil fields and the foodstuffs of North Africa then the British blockade of the European continent would be practically hopeless. But, at the close of 1940, in a careful survey of the effectiveness of the two blockades, the advantage went to Great Britain. (See also EUROPEAN WAR; INTERNATIONAL LAW; SHIPPING, MERCHANT MARINE.)

Stowell, *International Law* (1931); Thursfield, "Command of the Sea and Others," *Brassey's Naval Annual* (1939); Hanson Baldwin, articles on war at sea, *New York Times* (1940). (L. P. L.)

Blood, Sir Bindon (1842–1940), British general, was born in Cranaher, Ireland, Nov. 7. He enlisted in the royal engineers in 1860, saw active service in Africa and India, and was associated with Gen. Gordon in the Egyptian campaign of 1882. During the South African War he was promoted to the rank of lieutenant general. He was a Knight Commander and Knight Grand Cross of the Order of the Bath and a Knight Grand Cross of the Royal Victorian order. He died in London, May 16.

Blumer, George Alder (1857–1940), U.S. psychiatrist, was born in Sunderland, England, May 25. He studied in England, Scotland, Germany and France before going to the United States, where he was graduated from the medical school of the University of Pennsylvania in 1879, be-

coming at once a resident physician at Lankenau hospital in Philadelphia. He served there a year, then went to the State Hospital for the Insane in Utica, N.Y., as assistant physician. He was made superintendent in 1886. In 1899 he was transferred to the Butler hospital in Providence, R.I., and remained there until his retirement in 1922. Dr. Blumer did much to bring about humane treatment of the insane. He was an honorary member of the Royal Medico-Psychological association, the Society of Mental Medicine of Belgium and the Medico-Psychological society of Paris, and was a corresponding member of the Society of Psychiatry of Paris. He died in Providence, R.I., April 25.

Bock, Fedor von (1880–), German soldier, was born Dec. 3 at Kuestrin, near Berlin, and was educated at the Potsdam Military school. At the age of 17 he was assigned to an infantry guards regiment. He had advanced to a captaincy by the time of Germany's entry into the World War in 1914 and emerged from the war as a major.

In 1919 he became commander of the Peace army and in 1920 commander of the third army group, which post he retained for 18 years, until his appointment by Hitler as commander of the first army group in 1938. During the invasion of France in May and June, 1940 he commanded the lower Somme army group. He was one of the 12 German generals created field marshals of the reich by Hitler on July 19.

Boëx, Joseph H. H.: see ROSNY, JOSEPH HENRY.

Bohemia and Moravia. These two former provinces of Czechoslovakia (*q.v.*) have been a protectorate of the German reich since March 16, 1939. Bohemia has an area of 12,525 sq.mi., with a population of 4,472,354, Moravia an area of 6,533 sq.mi., with a population of 2,332,522. The vast majority of the population is Czech; however, there is a tiny minority of Germans which is increasing through the influx of German officials, soldiers and settlers from the German reich. The religion of the people is mainly Roman Catholic. The real government of the country was in 1940 in the hands of a representative of the German government, the Reichsprotector, Baron Constantin von Neurath, but a puppet government of the Czechs still existed under state President Emil Hacha.

GUN BARRELS large and small were manufactured in 1940 for the German army by the huge Skoda munitions plant in former Czechoslovakia

The war separated Bohemia and Moravia from all contacts with the outside world. The process of Germanization was speeded, the local administration was stripped more and more of its remaining powers, the anti-Semitic legislation was tightened, but at the same time the resentment of the Czech people grew, and they continued as far as possible their policy of passive resistance, centering their hopes upon the Czechoslovak government, which under the leadership of Dr. Eduard Beneš was formed in the fall of 1940 in Great Britain. The national socialist administration tried to promote the small Czech fascist group called *Vlajka*, but its influence remained very limited. In spite of all kinds of persecution the Czechs remained attached to the national solidarity party which represented the unified Czech nation. While Bohemia and Moravia continued until Sept. 15 as a separate economic unit, on that day they were incorporated into the German Customs union. Their whole economic life had by then been co-ordinated with the German economic life, of which they became an integral part.

(H. Ko.)

Bolivia, a South American inland republic on the southern Andean plateau; language, Spanish; capital, La Paz; president, General Enrique Peñaranda; area, 419,470 sq.mi. The population (1938 official estimate) is 3,398,000; Indians comprise over half, whites around an eighth. The chief cities (with est. pop.) are: La Paz, 202,000; Oruro, 45,000; Cochabamba, 37,000; Potosí, 35,000; Sucre, 32,000.

History.—Bolivia was politically unstable throughout 1940, although tension lessened as economic conditions improved late in the year. In the March 15 presidential elections, General Enrique Peñaranda was elected to succeed provisional President Carlos Quintanilla, who had served since Aug. 1939. He received nearly 80% of the approximately 75,000 votes cast in the entire country. On March 26 a revolutionary coup sought to prevent Peñaranda's installation, but was quickly suppressed and the new president took office April 15. In May a general amnesty released all political prisoners. A further outbreak was quelled in July, but political unrest continued and a serious cabinet crisis occurred in November.

Some difficulties with "fifth columnists" were experienced during the year, and charges were openly made that several newspapers were being subsidized by totalitarian interests. The Peñaranda administration, however, co-operated with the United States and other American republics in promoting hemisphere solidarity. On April 2 a treaty with Argentina was signed, under which Argentina undertook to construct a 62-mi. railroad from her frontier to Villa Montes in the Bolivian oil fields, accepting petroleum in payment.

The Peñaranda administration was regarded as generally more conciliatory toward foreign interests than any regime in the previous decade. Foreign observers viewed with optimism the prospects for a settlement of the four-year-old dispute over cancellation of the Standard Oil Company of Bolivia's petroleum concessions. Better prices for tin and other metals as a result of war demands and an agreement in October under which the United States undertook to purchase 18,000 tons of tin annually for five years (1940-45) materially improved Bolivia's financial condition. Meanwhile, negotiations were under way for the establishment of tin smelters in the United States to handle Bolivian tin ore. On Oct. 5, President Peñaranda outlined steps to be taken in anticipation of resumption of payments to the U.S.A. on Bolivia's defaulted dollar bonds.

Education.—In 1940 there were more than 2,000 primary schools, with more than 150,000 enrolment, and three universities (La Paz, Sucre and Cochabamba).

Trade and Communication.—External communication was

by rail to Peru, Chile and Argentina, and by Pan American Airways to all parts of the hemisphere. A 635-mi. railway from Santa Cruz to Corumbá, Brazil, has been under study and construction since 1937, with the eventual objective a connection with the Brazilian port of Santos. The project was lifted out of uncertainty by pledge of United States financial aid and formal endorsement by the Havana conference of a transcontinental railway from Santos to Arica (Chile) utilizing the Corumbá route. This, it was planned, would link several Bolivian and Brazilian lines and form the Bolivia-Arica railway into a unified system, thereby opening large hitherto inaccessible areas of Bolivia. Bids were asked and contracts let on several sections during 1940. The Bolivian highway system included nearly 900 mi. of Pan-American highway, some 4,500 mi. of other roads and an extensive additional mileage under construction.

Under European war influences, Bolivian exports in 1939 exceeded those of 1938 by 23.8 tons. Imports declined 5.9%, however. Exports and imports (expressed in bolivianos of 18 pence gold, or 36½ cents U.S.) totalled 117,399,540 bs. and 66,401,727 bs., respectively. Exports in the first half of 1940 ascended to 73,656,589 bs. Minerals accounted for 97.2% of all 1939 exports. Tin alone aggregated 70.1%.

Finance.—The monetary unit is the boliviano (value: approx. 2½ cents U.S.). On June 30, 1940 the external debt totalled \$109,240,054, the internal debt \$125,099,148.

(L. W. BE.)

Bonci, Alessandro (1870-1940), Italian tenor, was born in Cesena and studied for five years at the Liceo Rossini in Pesaro. He made his operatic debut at Parma as Fenton in *Falstaff* in 1896. He then sang in Leghorn and Milan and soon accepted offers to appear in St. Petersburg, Berlin, Vienna, Lisbon, Madrid and London. Following his first appearance in London in 1900 he sang in South America and Australia. Oscar Hammerstein engaged him to sing in the Manhattan opera house in New York city, where he first appeared on Dec. 6, 1906, in *I Puritani*. He joined the Metropolitan Opera company in 1908. He toured the United States as a concert artist in 1910-11 and in 1919-21 he sang with the Chicago Opera company. He was regarded as a rival of Caruso. The king of Italy made him a Commander of the Crown. He died in Milan, Aug. 10.

Bonds. Disturbed world conditions were responsible for a series of sharp extremes in U.S. investment markets during 1940. Despite the extraordinary nature of events, however, average levels of prices of most classes of bonds not only advanced to new high marks for recent years but in some cases rose to all-time record peaks. Many factors entered into the broad pattern for the year in this respect, but the basic reason for the broad upward trend was the same easy money situation that had prevailed since 1933, the swollen aggregate of funds available for investment in the hands of banks, institutions and individuals creating a mounting demand for funded loans, particularly those of the so-called "gilt edge" type.

Seemingly incongruous in this connection was the fact that despite increase during 1940 in financing operations to the most active pace in four years, trading in bonds in the general market shrank to the smallest total in 23 years, as reflected in transactions on the New York Stock exchange. Turnover in funded obligations of all classes on the big board during the period amounted to \$1,669,426,250. This compared with \$2,046,083,000 for 1939 and \$4,098,696,000 in the record year of 1922. Much of the trading in bonds was in the so-called over-the-counter markets, though, and those appeared to have been favoured with relatively better activity, stimulated to a considerable extent by the financing operations.

Refunding dominated the issuance of new securities during the year, as had been the case for the several preceding years, "new money purpose" borrowing being negligible. This mirrored the unwillingness of investors under such uncertain world and domestic conditions to put their funds in any but the comparatively riskless type of enterprise and the reluctance of management to incur new debts for any except the most urgent needs. According to one compilation, there were 440 individual new bond issues in 1940 for a total of \$2,635,489,000, compared with 432 issues for \$2,184,321,000 in 1939 and 695 issues for \$4,879,141,000 in 1936, the highest immediately-preceding year. This was in addition to an additional amount of securities placed directly with institutional investors in private negotiations variously estimated at one-third to more than one-half of the total offered through the normal channels to the public.

Among the corporate divisions, the public utility industry held its leadership of the last few years, although its financing volume was the smallest since 1937. Stimulated by the expanding influence of the national defence program, although the effect was more psychological than actual, industrial financing increased substantially over the preceding three years. A bright aspect of the situation was the brisk resumption of general market funding by the railroad field. Conspicuous was the absence in 1940 of any foreign dollar financing in the United States, issues of this type accounting for \$39,250,000 the year before. In United States government financing 1940 was notable for inauguration of the huge borrowing program of the treasury incidental to the defence program.

Price-wise, United States government loans climaxed a seven-year uptrend in 1940 by ending the period at their all-time tops. This was reflected in the shrinkage of the average yield of representative longer-term issues to 1.86% in December. This compared with 2.30% at the start of the year.

Corporate liens also attained their best levels in December, with the exception of industrials. The Dow-Jones composite average of 40 representative issues of all classes reached 91.01 on Dec. 12 and on the same day first grade railroad obligations reached 95.93. Secondary rails topped at 51.11 on Oct. 10 and utilities at 110.51 on Nov. 15. Industrials subsequently failed to better their peak of 108.85 made in January.

State and municipal bonds also set new high price records toward the close of the year. The altitude of quotations was indicated in the decline in the average yield to 2.18% on representative issues of 20 prominent cities of the country, as compiled by the *Bond Buyer*. Average yield on the obligations of 11 cities of the highest credit rating shrank to 1.84%.

Prominent in the year's developments affecting the bond market was the revival with increased vigour of the movement directed toward the elimination of tax-exemption on federal and civic issues, with indications at the close of the period that something definite would be done along that line in the not distant future. Book-collecting. Bibliographical activity during 1940 accented categories rather than personalities. Ernest R. Gee's *The Sportsman's Library: A Descriptive List of the Most Important Books of Sport, American and English*, Dichter and Shapiro's *Early American Sheet Music* and Louis C. Karpinski's *Bibliography of Mathematical Works Printed in America through 1850* are typical of the trend of research. So, in only less degree, is Thomas J. Holmes's Cotton Mather bibliography, for

Mather was an epoch and a philosophy as much as he was an individual.

Similarly representative is the new edition of *Incunabula in American Libraries*, edited by Margaret Bingham Stillwell. This thorough and comprehensive manual supplants a compilation published in 1919, when the stimulus supplied by Henry E. Huntington and others whose interests paralleled his own was making the collecting of early printed books popular in the United States. The earlier edition of this census listed 13,200 copies of 6,292 titles of pre-1501 books in private and institutional collections in the United States. The 1940 edition presents a schedule of 35,232 copies of 11,132 titles—an increase of 167% in number of volumes and of 77% in number of titles.

The new edition of the incunabula census was published under the sponsorship of the Bibliographical Society of America. This important accomplishment is typical of the vigour which has been infused into the society in recent years largely as the result of an increased membership recruited in the main from the ranks of younger collectors and younger booksellers, many of whom are alert and competent bibliographers in their own right. Time was, and not so far distant, when the terms bookseller and bibliographer were supposed to be, and generally were, mutually exclusive. There were, of course, such significant exceptions as Joseph Sabin of New York and P. K. Foley of Boston, whose researches survive them as enduring monuments.

Undisturbed by the bombs which have inflicted an undisclosed amount of damage on the British museum, the Library of Congress continued to develop the facilities of its own rare book collection. On April 1, Arthur A. Houghton, Jr., owner of one of the great U.S. private libraries, became curator of this collection, and on the same day Jacob Blanck, editor of *American First Editions* and *American Book Prices Current*, under the terms of a special foundation administered by the library, undertook the compilation of an exhaustive bibliography of juvenile books of 19th century United States. The library had previously and with elaborate ceremonies dedicated the Hispanic foundation as a practical contribution to a better understanding among the new world republics. Further proof of the fact that the Library of Congress is becoming, under the direction of Archibald MacLeish, one of the great repositories of world culture is evidenced in the accumulation of oriental books and manuscripts. Among other fields in which fresh activity was noteworthy was the library's poetry collection, headed by Joseph Auslander, assisted by Audrey Wurde-man and Kenton Kilmer.

The death of A. Edward Newton (1863-1940) on Sept. 29 can almost be said to have closed a collecting era. Newton was an inspiring link between the old school and the new. His classic *Amenities of Book Collecting*, first published in 1918, was the greatest stimulus to bibliophily ever written. (J. T. W.)

Booklist: see AMERICAN LIBRARY ASSOCIATION.

Books: see CHILDREN'S BOOKS; PUBLISHING; see also under AMERICAN LITERATURE; ENGLISH LITERATURE; FRENCH LITERATURE, etc.

Book Sales. Westward bound books continued to cross the ocean, usually under dramatic circumstances whereof the story is not often to be told. One such incident, however, can be disclosed here. In 1938 Frank J. Hogan of Washington, D.C., later president of the American Bar association, bought in the U.S. what is regarded as the finest copy in existence of the Caxton *editio princeps* of Chaucer's *Canterbury Tales* (Westminster, 1475). A minor binding repair was necessary and Mr. Hogan took the book with him to London in 1939. He returned to the U.S., leaving instructions to have the book sent to him as soon

as the repair was made. The war broke out, and the English expert was reluctant to ship the volume. In the summer of 1940 the British bookman took his family to the United States, but first he cabled Mr. Hogan asking if he should also bring the Chaucer and if he should insure it. Mr. Hogan replied that if the bookseller were willing to entrust his family to the efficacy of the British convoy system, he himself was willing to risk the Chaucer's safe arrival uninsured. The whole party crossed in safety and the Caxton Chaucer was in 1940 one of the glories of the Hogan collection.

Many of Britain's dealers removed their stocks to the country with the advent of war. Others remained in London, housing their merchandise as best they might. The underground vault of one famous Pall Mall bookseller became a secure air-raid shelter. Several shops which were not so well equipped suffered varying degrees of damage. The establishment of Dulau & Co., well known to U.S. collectors, was destroyed by a bomb on Oct. 12, 1940, and Leslie Chaundy, a member of the firm, was killed.

In 1940, in anticipation of bombings to come, London bookmen decided to hold no auctions. When at first the bombings failed to materialize, an attempt was made to inaugurate an auction season. Then the bombers came and the idea was abandoned.

The most important New York sale of 1940 was the dispersal of the library of the late John Gribbel of Philadelphia (Oct. 30, 31, Nov. 1). The 810 lots realized \$144,239. The high points of the sale were Robert Burns's own copy of *The Scots Musical Museum* (four volumes, Edinburgh, 1787-88-90-92), heavily annotated, including a holograph transcript in variant form of *Auld Lang Syne*, \$15,500, and a presentation copy of the first (suppressed) edition of Lewis Carroll's *Alice's Adventures in Wonderland* (London, 1865), one of three known inscribed copies, \$15,300.

An admirable example of the highly specialized library came on the market Dec. 4 and 5, 1940, when the William Mitchell van Winkle collection of the works of Frank Forester (Henry William Herbert) was sold. A first edition of *My Shooting Box* (Philadelphia, 1846) brought \$1,300, and a copy of *The Warwick Woodlands* (Philadelphia, 1845) \$800. This collection had served as the basis for the definitive Herbert bibliography (Portland, Me., 1936) by Mr. van Winkle and David A. Randall. (J. T. W.)

Booth, Ballington (1859-1940), Anglo-American religious leader, was born in Brighouse, England, July 28, the son of the Rev. William Booth, founder of the Salvation Army. He was educated at the Taunton Collegiate institute and the Nottingham Theological seminary. In 1885 he was sent to Australia to command the Salvation Army there. Two years later he was made commander of the army in the United States. In 1896 his father decided to transfer him to another command. He resisted and broke with the organization and founded the Volunteers of America, a rival organization of which he remained the head until his death in Blue Point, N.Y., Oct. 5.

Borah, William Edgar (1865-1940), United States senator from Idaho, was born in Fairfield, Ill., June 29. He was educated in the common schools of Wayne county, the Southern Illinois academy at Enfield, and at the Kansas State university. He was admitted to the bar in 1889 and practised at Lyons, Kan. for two years. In 1891 he went to Boise, Idaho, and devoted himself to his profession until he was elected to the senate in 1906. He was re-elected five times. He served as chairman of the following committees: foreign relations, Indian depredations, expenditures of the department of justice, interoceanic canals, education and labour. He opposed the entrance of the United States into the League of Nations and the Permanent Court of International Justice. He died in Washington Jan.

19. See *Encyclopædia Britannica*, vol. 3, p. 893.

Borates. Asia Minor, Italy, Argentina, Chile, Bolivia and Peru are all minor producers of borates, but are far outstripped by the 250,000 short tons of borax produced in the United States in 1939, of which 91,100 tons were exported. Borax is used in enamels for iron and steel, in glass and soaps, as a mordant in dyeing and tanning and in a number of minor uses.

(G. A. Ro.)

Borneo, an island in the East Indies, is divided politically into the British protectorate of Brunei; the independent states of North Borneo and Sarawak, both under British protection; and Dutch Borneo.

British Borneo.—Area, total c. 72,000 sq.mi.; pop. (est. Dec. 31, 1938) c. 840,000. Petroleum and natural gas are produced in considerable quantities; in 1934 a concession was granted to the Anglo-Saxon Petroleum company to prospect in North Borneo, and operations are proceeding. Large areas have been taken for the cultivation of Manila hemp.

Brunei: 2,226 sq.mi.; pop. 36,561 (Malays 30,433); capital, Brunei Town; British resident, J. G. Black; ruler, H.H. Sultan Ahmed Tajudin.

North Borneo: c. 29,500 sq.mi.; pop. 302,174 (Chinese 53,000); capital, Sandakan; governor and commander-in-chief, C. R. Smith.

Sarawak: c. 50,000 sq.mi.; pop. c. 450,000 (Malays, Dyaks, etc., c. 350,000; Chinese c. 100,000); capital, Kuching; ruler, H.H. Sir Charles Vyner Brooke, G.C.M.G. (Rajah); language (official), English; religions, Mohammedan, Buddhist.

Production.—**Brunei**, 1938; petroleum 707,219 metric tons; natural gas 3,195,000,000 cu.ft.; cutch (export) 1,695 metric tons; rubber 1,259 metric tons. **North Borneo**, 1939 (exports): rubber 23,900 metric tons; copra 13,050 metric tons; sago flour 2,705 metric tons. **Sarawak**, 1939 (exports): benzene, kerosene, oil and liquid fuel \$10,705,282; rubber \$15,384,928; gold \$1,141,155; sago flour \$1,572,181.

Overseas Trade.—**Brunei**, 1938: imports \$2,821,799; exports \$6,580,725. **North Borneo**, 1939: imports \$6,498,292; exports \$13,453,318. **Sarawak**, 1939: imports \$26,173,420; exports \$34,379,748.

Communications.—1938: roads, suitable for motor traffic: **Brunei** 102mi.; **North Borneo** 236mi.; **Sarawak** 101 miles. Railways open to traffic, **North Borneo** 125 miles.

Finance.—1938: Currency: Straits dollar (\$1 = 2s.4d.)

	Brunei \$	North Borneo \$	Sarawak \$
Revenue	1,179,979	3,286,831	4,261,899
Expenditure	1,476,725	1,861,373	4,272,140

Dutch Borneo.—Area: western district, 56,664 sq.mi.; southern and eastern district, 151,621 sq.mi.; pop. total (census 1930) 2,194,533. Government: under the governor-general of the Netherlands Indies.

Bosch, Carl (1874-1940), German chemist, was born at Cologne, Aug. 27. He devoted himself to the study of chemistry and became noted as the producer of natural products by chemical processes. During the World War of 1914-18 he perfected the chemical production of ammonia so that it could be manufactured on a commercial scale for use in the production of explosives. For this he received the Nobel prize in 1931 in conjunction with his colleague, Friedrich Bergius. He also produced synthetic gasoline and many other substances. When the German chemical industry was organized as a dye trust in 1925 he was made chairman of the board. Later he became president and general director. He died in Heidelberg, April 26.

Boston, seaport at the head of Massachusetts bay; capital of the state of Massachusetts, U.S. Population (1930) 781,188 (229,356 being foreign born whites); 1940 (U.S. census) 770,816. The city is ninth in population in the United States. Its metropolitan district (U.S. census), including 80 cities and towns, is fifth in population, (1930) 2,307,897; (1935) 2,385,465. The Democratic party predominates but municipal elections are non-partisan. The terms of Mayor Tobin and the 22 councilmen expire in Jan. 1942.

The Quabbin reservoir was opened and connected with the metropolitan water system. The Huntington avenue subway was practically completed. The United States weather bureau established a forecasting station at the Boston airport. The shipbuilding facilities of the metropolitan area make Boston an important re-armament centre. The Boston navy yard had contracts for 23 vessels. Plans were approved for extensive additions to the navy yard and the South Boston dry dock. The naval air base at Squantum was being greatly expanded. Bunker Hill village (1,089 dwelling units), the second housing unit in the \$32,000,000 program of the Boston Housing authority was opened. The American Legion convention crowded the city. Over 2,000,000 spectators watched the 12-hr. parade of 100,000 legionaries (Sept. 23). President Roosevelt and Wendell Willkie made major campaign speeches in Boston.

The chief municipal problems were declining assessed valuations (24.8% since 1930) and increasing traffic congestion. Tax rate: (1939) \$39.90; (1940) \$40.60, on an assessed valuation of \$1,483,234,500 (decline of \$41,565,500). Net bonded debt (1939): \$132,990,000. Daily traffic (1938): 257,000; (1940) increase of 12% (estimate).

Boston maintained 293 school buildings and 6,428 employees, including 4,611 teachers. Enrolment (1940): kindergarten to ninth grade 83,949 (declining since 1933); high school 31,332, special 5,010, teachers' college 156. There are 44 parochial schools. Enrolment (1940): elementary 28,000, high school 3,000.

Six of the 28 hospitals were tax supported. The 1940 Community fund raised by 200 institutions in the metropolitan area reached a net total of \$4,512,011.42. The overseers of the public welfare (1940) expended \$14,916,056.01. Cases for the week ending Dec. 14 were: dependent aid 11,643; dependent children 4,117; old age assistance 15,298; WPA employment 19,071. WPA earnings (1939) totalled \$19,213,000. The Federal Food Stamp plan was introduced in November (24,000 families eligible). The police force numbered 2,412. Expenditures (1939): \$5,881,909. Fire department employees totalled 1,526. Expenditures (1939): \$4,023,880. Fire loss per capita (1935-39): \$2.92.

Total bank resources exceeding \$3,000,000,000 and the Federal Reserve bank (first district) make Boston the financial centre of New England. Bank clearings (1940): \$12,106,585,000, a gain of 6%. Bank debits (Jan.-Nov. 1940): \$13,855,000,000, a gain of 3.4%.

Boston is the chief U.S. wool market and an important fishing port. Wool receipts (1939): domestic, 233,106,000lb.; foreign, 91,619,000lb. Fish landed (1939): 295,353,381lb., value \$8,007,425; (Jan.-Oct. 1940) 210,518,997lb., value \$7,097,311, a 15.1% decline by weight and a 6.4% increase by value. Total commerce of the port of Boston (1939): 17,842,212 tons (of 2,000lb.), a gain of 13%; imports, 2,169,610 tons; exports, 428,999 tons; (Jan.-Nov. 1940) imports gained 10.6% in value; exports gained 30.9%. Calls of ships in foreign trade: (1939) 1,695; (1940) 1,387.

Wholesale establishments (1935): 3,330; employees 32,334; pay roll \$60,753,000; sales \$1,333,016,000. Retail establishments (1935): 10,649; employees 60,968; pay roll \$65,746,000; sales \$439,120,000. Manufacturing establishments (1938): 2,225; capi-

tal invested \$222,167,918; stock and material \$185,363,524; employees 54,160; pay roll \$64,603,088; value of products \$367,366,715; average weekly earnings (1939) \$23.48. Indices (average 1925-27=100) read: manufacturing employment (1939) 74.3, (Jan.-Nov. 1940) 75.8; manufacturers' pay rolls (1939) 66.8, (Jan.-Nov. 1940) 69.6; department store sales (Jan.-Nov. 1940) 66.2, a gain of 2.1. Building permits (Jan.-Nov. 1940): \$11,762,291, a gain of 44.4%. Sales of electricity (1939): (1929=100) 144.9. Meters (1939): electric, 261,635; gas, 190,191. Number of dwelling units (1940): 211,620; vacancies, 13,889. Boston elevated passengers (1939): 295,123,077. Automobile registrations (1939): passenger cars, 99,843; trucks, 19,918.

(S. J. McK.)

Bostwick, Lucius Allyn (1869-1940), U.S. rear admiral, retired, was born in Providence, R.I., Feb. 21 and was appointed to the United States Naval academy in 1886. He was commissioned ensign July 1, 1892, and rose to the rank of rear admiral June 8, 1923. While serving as commander of the battle fleet from May 1929 to June 1930, he held the temporary rank of vice admiral. During the Spanish-American War he served on the "Oregon," taking part in the battle of Santiago, July 3, 1898. He was at the Naval War college from 1904 to 1906 when he was ordered to sea, serving as executive officer or commander of different warships. In 1925 he became chief of staff of the commander of the United States fleet and on July 1, 1930, he became commandant of the 4th naval district where he served until his retirement. He died in Washington Jan. 14.

Botanical Gardens. There were in 1940 some 155 botanical gardens and arboretums in continental United States alone. The forming of an organization known as the American Association of Botanical Gardens and Arboretums (A.A.B.G.A.) took place on Oct. 22, 1940, at Cleveland, O., at the time of the convention of the American Institute of Park Executives (A.I.P.E.).

During 1940 New York Botanical garden made extensive rearrangements of, and additions to, plantings, improvements to buildings and facilities for research, published a two-volume work on Caricaceae (Mackenzie) and reached the 2,000,000th specimen in the herbarium. During the year Brooklyn Botanic garden had nearly 2,000,000 registered visitors and contacted many others through lectures. They maintained five exhibits at the World's Fair, one of which was 119 varieties of Japanese Iris. Doctor Arthur H. Graves reported progress in selecting hybrid blight-resistant chestnuts of quality and Dr. George M. Reed showed progress in developing disease resistance in plants and concluded that many of the forms of native Louisiana irises are varieties rather than species.

During 1940 Missouri Botanical garden carried on extensive improvements in the arboretum 35mi. southwest of St. Louis, Mo., created two new hybrid tropical water lilies, added 3,000 new specimens to the "Flora of Panama," and published a report on its years of study of lawn grasses for St. Louis and a comprehensive report on the *Wild Flowers of Missouri*. Arnold arboretum, Boston, Mass., had in 1940 about 2,600 species of plants on 150ac. in cultivation. Several hundred others were tried and discarded for some reason or other. New acquisitions of land in 1940 ran the acreage to 221.

University of Wisconsin arboretum in 1940 was developing and restoring a 100-ac. Wisconsin prairie in the centre of its 900-ac. tract. Department of botany, University of Chicago, used its Wychwood property at Lake Geneva, Wis., as an outdoor ecological laboratory and bird sanctuary. University of Washington arboretum propagated about 400 species and varieties of rhodo-

dendrons for planting in its rhododendron glen. The Holden arboretum, Cleveland, O., enlarged the following ecological plantings: Atlantic pitch pine barrens, Rocky mountain subalpine forest and North American bog units. Montreal Botanical garden developed or enlarged during 1940 the following units: ornamental perennial, economic, water and bog and children's gardens. Morton arboretum, Lisle, Ill., started a 40-ac. planting of best shade trees and 17ac. of seasonal fruits for attracting birds.

Up to the end of the year 1940 only four numbers of *Bulletin of Miscellaneous Information of Royal Botanic Gardens, Kew*, came to the United States. These dealt largely with systematic studies of tropical plants. (See also BOTANY; HORTICULTURE.)

(W. C.)

Botany. Hybridization of wheat and rye to obtain the grain quality of wheat combined with the resistance of rye has been unsuccessful because the cross is difficult to make and when it occurs the hybrid is invariably sterile.

The extravagant claims made for the effectiveness of vitamin B₁ in increasing the growth of green plants have not been substantiated by later work. When care was taken to supply the plants with an adequate culture solution including the necessary minor elements, D. I. Arnon found no gains in dry weight due to the addition of vitamin B₁ to cultures of seedlings of tomato, cocklebur, cosmos and mustard.

S. Satina and A. F. Blakeslee use cells with *2n*, *4n* and *8n* chromosome numbers to trace the contribution of germ cell layers in the formation of plant organs in periclinal chimaeras. Inner conducting tissue of the style, through which the pollen tubes grow, is formed largely from the epidermal layer. The second germ layer contributes more toward the formation of leaves, sepals and petals, while the third layer contributes more to the formation of anthers and pistils.

Using a Geiger counter, D. I. Arnon, P. R. Stout and F. Sipos measured the rate of absorption and translocation of radioactive (P³²) phosphorus. After 40min. newly-absorbed phosphorus was detected in the leaves and tips of tomato plants over six feet tall. Radiographs of leaves and fruit slices were made by placing the tissue on paraffined paper on sensitive non-screen X-ray films wrapped in black paper or tin foil.

By cultivation of excised anthers in nutrient solutions W. C. Gregory found evidence that "control of the chromosomes at meiosis is not vested entirely in the cells actually undergoing the divisions but results from interactions involving one or more necessary materials which are transported into the anthers from another portion of the plant."

L. Knudson exposed spores of *Polypodium aureum* to X-rays and induced the formation of prothallia with abnormal chloroplasts; these plastid types persisted during seven years of vegetative propagation. Certain types were transmitted to the sporophyte and reappeared in the gametophyte of the new generation.

Solanum rostratum Dunal, although without a definitely organized cuticle on its leaves, is, according to W. H. Horr and F. Dill, one of the most drought resistant plants in Kansas.

Treatment by L. P. Miller of growing tomato plants with chemicals such as ethylene chlorohydrin, *o*-chlorophenol, chloral hydrate and trichloroethyl-alcohol induced the formation in the living tissue of relatively large amounts of glycosides in which the added chemical was the aglycon and in which the sugar component was the relatively rare disaccharide, gentiobiose.

F. M. Turrell and D. E. Bliss noted that *Alternaria* can attack the unwounded fruit of the date only at a stage of development which coincides with the time when a water soluble phenolic derivative in the epidermis of the fruit becomes insoluble.

According to a report by J. S. Penny, dredging operations along the Delaware-Chesapeake canal have uncovered tons of lignitic

and succiniferous wood from the upper cretaceous strata. Over 50 logs were studied. Genera were: Pityoxylon, Araucarioxylon, Brachyoxylon and Cedroxylon.

Evidence presented by B. K. Stewart of fossil flora of Creed valley, Colo., indicates that the dry grasslands, chapparal and forest types similar to those of today existed in this valley during late Tertiary time.

Photoperiodic control in Biloxi soybean, according to H. A. Borthwick and M. W. Parker, is transmitted through the leaves and the effectiveness depends upon the age of the leaf, the most effective stage being at the time the leaf reaches full size. The most active leaf, operating alone, is as efficient as all of the leaves acting simultaneously. The flower-forming stimulus moves readily either up or down the stem.

E. M. Long gave *Xanthium* leaves the proper light exposure to cause induction of a photoperiodic effect in them and then grafted the leaves to vegetative plants; the grafted leaves induced flower initiation in plants exposed to a continuous long light period.

Some subjects dealt with in papers on the program of the American Phytopathological society at its 32nd annual meeting in Philadelphia were: L. W. Nielsen, "Silver Sprays with Promising Fungicidal and Adhesive Properties"; W. D. Valleau, "Experimental Production of Symptoms in So-called Recovered Ring-spot Tobacco Plants and its Bearing on Acquired Immunity"; F. Johnson, "Transmission of Viruses by the Parasitic Activities of Dodder"; S. J. P. Chilton, "Loss of Sporulation in *Colletotrichum Destructivum*"; R. U. Swingle, P. E. Tilford and C. F. Irish, "A Transmissible Mosaic of American Elm"; R. J. Acree, "Temperature as a Precision Factor in Chemically Distinguishing *Cronartium Ribicola* and *C. Occidentale*"; L. O. Kunkel, "Cure of Aster Yellows by Heat Treatments"; E. M. Hildebrand, "Mechanical Transmission from Currant to Tobacco of a Virus Identified as *Annuus Zonatus*"; S. L. Hopperstead and T. F. Manns, "Buds as a Factor in the Overwintering of Shot-Hole of Peach, *Phytophthora Pruni*"; A. G. Newhall, "An Undescribed Storage Rot of Celery"; C. C. Wernham and R. S. Kirby, "A New Turf Disease"; A. E. Jenkins, "*Asochyta Majalis* Identified on Lily of the Valley in the United States"; N. E. Rigler and G. A. Greathouse, "The Isolation of Fungicidal Compounds from the Root and Bark of *Citrus Aurantium*"; F. Hedges and H. Fisher, "Association of *Bacterium Phaseoli* and the Virus of the Common Bean Mosaic"; R. B. Harvey, "Fluorescence of Potatoes under Ultra-Violet Light for Detecting Ring Rot"; J. T. Barret, "A New Species of Spongospora in Roots of *Australis Cotus*"; V. K. Charles, J. N. Couch, J. G. Harrar and J. J. McKelvey, Jr., "A Fungous Parasite of Mealy Bug"; D. E. Bliss, "A New Species of *Ceratostomella* on the Date Palm." (See also BOTANICAL GARDENS; HORTICULTURE.)

(F. E. DE.)

Boulder Dam: see DAMS; ELECTRIC TRANSMISSION AND DISTRIBUTION; WATER POWER.

Bourbon, Jean Pierre Clement Marie de

(1874-1940), duke of Guise and pretender to the throne of France, was born in Paris, Sept. 4, the son of the duke of Chartres. Until his cousin, the duke of Orleans, Bourbon pretender to the throne, died in March 1926, he lived quietly at his chateau in the department of Aisne. As he was next in line of succession he was compelled by law to leave the country. He went to Brussels, dividing his time between that city and his large estates in Larache, Spanish Morocco. He served in the French Red Cross during the World War of 1914-18. On Feb. 1, 1933, he made his first political statement, a proclamation addressed to war veterans, state employees and taxpayers, calling on them to choose between

"oppression, anarchy and socialism" and "authority, liberty and monarchy." The duke in Nov. 1937 made a direct appeal to the people to restore the monarchy as the only alternative to national disaster. Following the victory of Germany in 1940, the royalists renewed their activity in his behalf. He died in Larache, Aug. 26, and was succeeded as pretender by his son, the count of Paris.

Bourne, Jonathan, Jr. (1855-1940), U.S. senator, was born in New Bedford, Mass., Feb. 23, the son of a shipowner. After attending Harvard, he went to sea in one of his father's ships and was wrecked off the island of Formosa. The ship which rescued him landed him in Portland, Oregon. He studied law and was admitted to the Oregon bar in 1881 but within a year he turned his attention to business. He served three terms in the state legislature and was elected to the United States senate in 1907, serving until 1913. He was the author of the parcel post law and was active in the National Progressive Republican league which supported Theodore Roosevelt for the presidency in 1912. He opened an office in Washington after his term as senator expired and died in that city Sept. 2.

Bower, Bertha Muzzy (1871-1940), U.S. author, was born in Cleveland, Minn., Nov. 15, the daughter of Washington Muzzy. She was taken to Montana by her parents when a small child and in 1890 she married Clayton J. Bower. Her first novel of western life, *Chip of the Flying U*, was published in 1906 under the name of B. M. Bower. She wrote thereafter a novel almost every year. Her last, *The Singing Hill*, appeared in 1939. She died in Los Angeles, Calif., July 28.

Bowling. The games were played in 1940 on some 165,000 alleys in recreation centres, clubs, church houses, colleges, schools, etc., by 12,000,000 bowlers. They played once or twice a week from six to eight months during the year and spent nearly \$300,000,000 for fees, dues, refreshments, apparel, etc.

The 40th annual American Bowling congress championships, held in Detroit, drew more than 30,000 bowlers from 731 cities, witnessed by 100,000 spectators during the eight weeks of competition. Although no A.B.C. scoring record was exceeded, the 1940 tournament gained the distinction of being the only one in which two perfect "300" games were rolled. A frame of 12 consecutive strikes was scored by George Pallage, of Akron, Ohio and Angelo Domenico, of Canton, Ohio.

The A.B.C. champions in 1940 were: Ray Brown, of Terre Haute, Ind., singles winner, with a score of 742; Herbie Freitag and Joe Sinke, of Chicago, with a total score of 1,346, won the doubles title for the 12th time; Fred Fischer, of Buffalo, N.Y., won the all-events title with a score of 2,001. (J. B. P.)

Boxing. Joe Louis dominated boxing through 1940, a contradictory year that saw greater activity than ever before among champions in most of the eight standard divisions known to the sport, the passing of many titleholders and, yet, a falling off in receipts.

Louis held to his 1939 standard in title defences. He faced four challengers and conquered them all. Yet he was not the most active titleholder. The palm for this went to Henry Armstrong, California Negro, who at one time in his career enjoyed the unparalleled distinction of holding three championships at one time—the featherweight, lightweight and welterweight championships. Incidentally, Armstrong was one of the titleholders toppled from eminence. He lost his welterweight championship.

Louis started the year by winning a 15-round decision over

Arturo Godoy, sturdy Chilean, in Madison Square garden, New York. It was a divided decision after a bout in which Louis failed to add lustre to his reputation, principally because of a shortcoming he has never been able to overcome and, likely, never will. He generally appears to disadvantage against a boxer who fights out of a crouch. The gross receipts for the match amounted to \$84,490, smallest for any Louis championship fight in New York. The champion followed this with a knockout over Johnny Paychek, Des Moines, Ia., challenger, on March 29 in Madison Square garden. The knockout came in 44 seconds of the second round of a one-sided bout from which the Finnish Relief fund realized a sum in excess of \$7,000. Following this came Louis's major bout of the year, an outdoor struggle against Godoy staged at the Yankee stadium, New York, and ending in the knockout of Godoy in the eighth round, the battle being stopped after 1min. 24sec. of the eighth round.

It was Louis's 11th defence of the title and attracted gross receipts of \$149,505, the year's biggest gate, yet far short of the largest gate of 1939, which was \$347,870 at the bout in Detroit in which Louis knocked out Bob Pastor in 11 rounds. Louis's fourth title defence was staged in Boston, Dec. 16, when he knocked out Al McCoy in six rounds. This bout, first heavyweight title bout ever staged in Boston, was another disappointment from the standpoint of Louis's form. He was fighting another crouching challenger and encountered the old difficulties. Louis's fire, however, brought a swelling to McCoy's left eye which assumed such dangerous proportions the challenger's seconds refused to let him respond to the bell for the sixth round.

Through the year Louis earned \$129,312, not as much as he earned for some of the battles in which he engaged while climbing to the top. The sum reflects the standard of challengers as well as the existing economic situation. His earnings for 1940 boosted Louis's gross earnings from the ring since the day in 1934 when he abandoned a labourer's berth in the plant of Henry Ford to follow a boxing career, to \$1,722,908.

Armstrong gained distinction as the most active champion through six successful title defences before he lost his crown to Fritzie Zivic of Pittsburgh. Armstrong knocked out Joe Ghouly in five rounds at St. Louis, Jan. 4; Pedro Montanez in nine rounds in Madison Square garden, Jan. 24; Paul Junior in seven rounds in Boston, April 26; Ralph Zanelli in five rounds in Boston, May 24; Paul Junior (again) in three rounds in Portland, Me., June 21 and Phil Furr in four rounds in Washington, D.C., Sept. 23 before being dethroned. He lost his title to Zivic in a blistering 15-round struggle in Madison Square garden Oct. 4, barely surviving the distance. Zivic engaged in three non-title bouts but did not defend the championship before the year ended.

Billy Conn, Pittsburgh boxer, retained his world light-heavyweight title in a single defence. He won a 15-round decision over Gus Lesnevich in Detroit, June 5. He ended the year signed to a contract for a 1941 fight against Joe Louis for the world heavyweight title. The middleweight division saw a double change of titles. Ken Overlin of Washington, D.C., gained recognition in New York when he won a 15-round decision over Ceferino Garcia on May 23. Garcia had previously defended the title in a ten-round draw against Armstrong in Los Angeles. Overlin twice defended the championship in 15-round bouts against Steve Belloise, New York challenger, winning a decision each time. The National Boxing association recognized Tony Zale of Chicago as middleweight champion on the strength of a victory he scored over Al Hostak in Seattle. Efforts to pair the rival title claimants were unavailing.

In the lightweight division Lew Jenkins of Stillwater, Tex., knocked out Lou Ambers of Herkimer, N.Y. in three rounds of a bout in Madison Square garden May 10, to become generally rec-

THE FACE OF JOE LOUIS displayed a rare expression during his fight with Arturo Godoy at New York city June 20, 1940. His knockout of Godoy in eight rounds was his eleventh heavyweight championship victory in three years

ognized as champion. He knocked out Pete Lello of Chicago in New York on Nov. 22 in two rounds in his only title defence. Prior to Jenkins' bout with Ambers, the National Boxing association had declared the title vacant and sanctioned a bout between Sammy Angott of Washington, Pa., and Davey Day of Chicago, as a title match. Angott won this battle in Louisville and became N.B.A. champion. Harry Jeffra of Baltimore won a 15-round decision over Joey Archibald of Providence, R.I., in Baltimore, May 20, to become world featherweight champion in New York and several other sections of the country. But Petey Scalzo of New York defeated Frankie (Kid) Covelli in Washington, D.C., in May, to gain recognition as N.B.A. featherweight champion. In the bantamweight class Lou Salica of New York, defeated Georgie Pace, Toronto, Can., 15 rounds, decision, in New York, Sept. 24 to gain undisputed possession of the world championship. The flyweight class, once one of the most popular in boxing, was entirely inactive.

Added to his championship defences was the distinction of Armstrong in a six-round knockout over Lew Jenkins July 18 at the Polo Grounds, New York, in a non-title bout. This bout attracted 23,306 persons and gate receipts of \$111,486. Other outstanding developments involved Max Baer of Livermore, Calif., former world heavyweight champion. He knocked out Tony Galento in eight rounds at Jersey City, July 2, before 22,711 persons who paid receipts of \$98,000 and on Sept. 26 Baer knocked out Pat Comiskey in 2min. 39sec. of the first round in a bout which attracted gate receipts of \$68,575 in Jersey City and was refereed by Jack Dempsey, former heavyweight champion. Dempsey undertook a "come-back," but abandoned the project after disposing of three obscure opponents in bouts staged in July.

Amateur Boxing.—Amateur and collegiate boxing continued to enjoy wide popularity. Sectional, intercity and national tourna-

ments aside from the city, state, district and national championships of the Amateur Athletic union increased activity in amateur boxing beyond that of previous years. The Eastern Intercollegiate association championship was won by Penn State college, retiring the trophy. The Eastern Intercollegiate conference championship title was retained by Bucknell university.

Europe.—Boxing abroad was at a standstill because of the war. There were instances, in what few bouts were held, where the principals were paid off in foodstuffs. A notable instance was furnished in a bout staged in Paris after the German occupation when one of the principals received a sack of potatoes and a bottle of wine, in addition to 100 francs. (J. P. D.)

Boys' Clubs of America, Inc. Boys' Clubs of America, Inc., is a federation of 348 organizations which provide leisure-time activities under trained leadership for nearly 300,000 boys between the ages of 7 and 18. They are found chiefly in the congested high-delinquency districts of urban communities. Boys' clubs are non-sectarian organizations and welcome boys of all classes and creeds. Each organization within the membership of the Boys' Clubs of America is completely autonomous, but looks to the national organization for the stimulation and promotion of the Boys' Club movement, and program, personnel and finance services which would be difficult, if not impossible, to secure if left to the individual units.

Boys' Clubs of America, Inc., was organized in Boston on May 19, 1906. Its control is vested in a board of directors who are elected by vote of the representatives of the member organizations. Specific responsibilities are delegated to a professional staff and to an executive committee. The officers are Herbert Hoover, chairman of the board; William Edwin Hall, president; Thomas Chew and Frank S. Mason, vice-presidents; Albert H. Wiggins, treasurer; William Ziegler, Jr., secretary. The headquarters are at 381 Fourth avenue, New York city. The budget for the year 1939 was approximately \$150,000.

Boy Scouts. During 1940 the increase in membership of the Boy Scouts of America was 80,995 for the first nine months, bringing the total up to 1,421,945. During the first nine months of 1940 there were 1,847,061 boys and men participating in the Scout program. Since the Boy Scouts of America was first founded in 1910, through Sept. 1940, 9,412,638 persons have been associated with it.

In 1940 the Boy Scouts of America again actively participated in the New York and San Francisco world's fairs. A demonstration and service camp was again maintained and more than 175,000 visitors inspected the Boy Scout New York world's fair camp, where nearly 3,000 scouts camped while rendering service to the fair.

The 30th annual meeting of the Boy Scouts of America was held from May 9 to 10 in Oklahoma City, Okla. The theme of the meeting was "The American Way." Members attended from all parts of the country.

During 1940 the Boy Scouts of America joined with 15 other national organizations, under the auspices of the Citizenship Educational service, in issuing "A Call to All Americans," a statement developed to arouse all citizens to vitalize the ideals of American democracy. A program of action for strengthening and invigorating democracy was also launched, consisting of an inventory and roll call of scouting's strength, the development of the Scout Emergency Service corps idea, and preparation for the mobilization of Scouts and Scouters quickly to render service in case of disaster or emergency.

Great Britain.—During 1940 reports from Scout organizations

abroad were scattered and few because scouting in many countries has been forbidden by the totalitarian governments. Reports from the Boy Scout association in England, however, showed that British Scouts, in line with their motto "*Be Prepared*," were meeting each new emergency and rendering splendid service as the war went on.

Following is a list of activities which have been carried out by Cubs and Scout troops since the outbreak of war in Great Britain. This list, though not complete, is a splendid record of work well done.

Air Raid Precautions.—Wardens; messengers, cyclist and motorcycle messengers; decontamination squads; telephone operators; miscellaneous orderly duties indoors at town halls, control centres, etc.; delivering calling-up letters to A.R.P. personnel; call-boys for A.R.P. personnel; driving A.R.P. personnel; policing air raid shelters; policing trenches; sandbag emplacements, etc.; sandbag filling and stacking; camouflaging buildings; blacking out public and private buildings; escort duties to female A.R.P. night staff; gas masks—assembling, fitting, distributing, repairing and disinfecting; distributing, repairing and making gas mask containers; making wardens' rattles; erecting A.R.P. shelters for the old and infirm; assisting householders with trench digging; supplying messengers to inform deaf of air raid warnings and "all clear"; guides to aged, infirm, mothers, children, new arrivals in black-out; patrolling during black-out and directing traffic; painting and lettering tin helmets; training civilian stretcher parties; pumping water from Anderson shelters; guides to meet reinforcements and conduct them to various parts of town.

Auxiliary Fire Service.—Firemen; messengers; guides; telephone operators.

Thames River Emergency Service.—Telephone operators; stretcher bearers; signallers.

Police.—Special constables; war reserve police; messengers; guides; helping with traffic, distributing notices.

Scouts also took part in hospital and first aid work, evacuation work, forestry work, agriculture, home guard and refugee work.

(J. E. W.)

Brandy: see LIQUORS, ALCOHOLIC.

Branly, Desire Edouard Eugene (1844–1940), French physicist, was born in Amiens, Oct. 23. He began his professional career on the faculty of the Catholic institute in Paris with an imperfectly equipped laboratory. In spite of this handicap he devised a coherer which played an important part in the development of wireless telegraphy. When Marconi sent his first wireless message from England to France in 1899 he admitted his indebtedness to the work done by Professor Branly. Branly had exhibited his invention before the French Academy of Sciences in 1891 and was elected to membership in the academy. As his salary was too small to support him he studied medicine and practised it for 25 years to earn money to pursue his scientific experiments. He died in Paris, March 24.

Brauchitsch, Walther Von (1881–), German general, was born in Berlin on Oct. 4, the son of a general of cavalry, and was educated in the German capital. He entered a military academy and became a lieutenant in 1900. In 1912 he became an officer of the German general staff and he served in this position during the war of 1914–18. He was appointed inspector of artillery in 1932, and the following year he succeeded Marshal von Blomberg as commander of the East Prussian army district, which in 1935 was trans-

formed into the 1st army corps. In 1937 he became commander of the 4th army group, and in Feb. 1938 after the "army purge" he succeeded Gen. von Fritsch as commander-in-chief of the German army. He personally directed the campaigns in Poland, the Netherlands, Belgium and France. For his military services to the reich he was singled out for special mention by Adolf Hitler on July 19, 1940, and, with 11 other generals, was raised to the rank of field marshal. In his Christmas message to the German troops Brauchitsch declared the English channel would protect Great Britain "only so long as it suits us."

Brazil, a republic in eastern South America and largest independent country in the western hemisphere; language, Portuguese; capital, Rio de Janeiro; president-dictator, Dr. Getulio Vargas.

Area and Population.—The area is 3,291,416 sq.mi., 7.5% greater than that of the United States. The boundary line is approximately 23,648km. in length, and touches every South American country except Chile. The population was officially estimated at 45,002,176 in 1939, and unofficially at 45,500,000 at the end of 1940. On Sept. 1, 1940, a comprehensive human and economic census of the entire country was begun. Publication of results of this census was expected during 1941.

The great bulk of the population lived on the coastal strip, but colonization in the interior was being pushed. The north, especially around Bahia, was largely negroid, with Indian elements in the Amazon basin. Italian, Portuguese, Spanish, German and Japanese immigration, in the order named, was especially heavy in the southern states. In 1939, 22,668 foreigners entered Brazil with intent to settle. The principal cities (with 1938 est. pop.) are: Rio de Janeiro, 1,848,758 (1940 est.: 2,000,000); São Paulo, 1,322,643 (1940 est.); Recife (Pernambuco), 529,863; São Salvador (Bahia), 381,919; Porto Alegre, 368,352; Belém (Pará), 309,238; Bello Horizonte, 208,177; Santos, 203,126.

History.—Brazilian history during 1940 was dominated by developments arising directly or indirectly from the European war. On Jan. 15 the Inter-American Neutrality committee, an outgrowth of the Panama conference of Sept. 1939, began its sessions at Rio de Janeiro, and studied measures to maintain the "safety zone" proclaimed by the Panama conference.

Fifth columnism in Brazil received considerable publicity, and charges were freely made that nazis in Brazil had a "slush fund" of over \$1,000,000. Although numerous foreign schools were closed for violation of laws prohibiting teaching in foreign languages, and other anti-fifth column measures taken, Brazil's problem, in the opinion of many observers, was still serious at the end of the year.

Relations with Great Britain were, on the whole, good, especially since that country made extensive purchases from Brazil. In December, however, Brazilian indignation was aroused by three acts of the British navy, seizure of Germans from a Brazilian ship, removal of goods on a Venezuela-bound Brazilian ship when it touched at Port of Spain, Trinidad, and, finally, detention of the westbound Brazilian ship "Siqueira Campos" at Gibraltar. The last precipitated a bitter but small flareup, but the issues were satisfactorily settled in mid-December.

Brazil took part in the Spanish-Chilean diplomatic rift by taking over Chilean interests in Spain and refusing to surrender the refugees whose asylum in the Chilean embassy had brought on the dispute (see CHILE). Similar manifestation of Pan-American solidarity was made in June, when, after reportedly informing the Uruguayan government of fifth column plots against it, the Brazilian government sold Uruguay much needed military supplies (see URUGUAY).

The sincerity of President Vargas' Pan-Americanism was

earlier called into question, however, when on June 11, immediately following Italy's formal entry into the European war, the Brazilian dictator, in a public speech, used language widely interpreted as praise for the axis powers and for totalitarianism. While critics cited earlier Vargas acts and policies as evidence of his pro-fascist personal feelings and the press of the democratic nations of America accused him of double-dealing, others regarded it as a sop to fascistic members of his own cabinet and to Brazilians of Italian and German descent. A few days later, to offset the hemisphere-wide unfavourable reaction, Vargas declared himself for Pan-American solidarity; subsequently, however, his continued reiteration of some of the ideas of his June 11 speech, interspersing them with laudations of Pan-Americanism and purging of fifth columnists caused some commentators to dub him the hemisphere's most adept tight-rope walker.

Despite Vargas' utterances, relations with the United States were increasingly friendly. Brazil lent strong support to the United States policies at the Havana conference, and acclaimed the United States-British destroyer-base deal of Sept. 2 (*see WEST INDIES, BRITISH*). Reported negotiations for United States acquisition of bases in Brazil failed to materialize during the year, despite Brazil's extreme vulnerability to transatlantic attack. United States aid to Brazil was given most particularly through \$25,000,000 in United States Export-Import bank credits.

Internal political instability was to a considerable measure due to economic depression, the outgrowth of the long-continued low price of coffee, and accentuated by war conditions. On March 26 an anti-government conspiracy was reported uncovered in São Paulo, and several persons of substance arrested. In accord with established Brazilian custom the government charged that communists were behind the movement, although those arrested were for the most part linked with São Paulo big business elements, politically dispossessed since 1930. Most of these were shortly released, but 64 communists were sentenced to hard labour. The most concrete result was the tightening of Vargas' political control. That political unrest was still bothering the government, however, was evidenced by rumours, apparently circulated for political effect, that a new constitution would be promulgated and that Vargas would hold a plebiscite. In August Pres. Vargas began a tour of scantily populated western Brazil. On Oct. 4 he took the occasion of the tenth anniversary of the successful revolution which brought him to power to press colonization of the Goya hinterland. A settled policy of encouraging immigration was pushed through the year. The immigration quotas were increased, all restrictions on incoming Portuguese lifted, and unfilled quotas of other countries given to Finnish settlers. Haven was offered to 3,000 German refugees. The state of São Paulo alone was declared able to use 300,000 immigrants. Government officials estimated 50,000 Portuguese farmers would come in under a free passage policy.

Shrinkage of European markets seriously disturbed Brazil's already unsatisfactory economic position. One favourable war effect, however, was the influx of "refugee money" from Europe, as wealthy refugees from Hitler-dominated countries of Europe brought in new capital estimated by some as high as \$25,000,000.

Trade relations within America were furthered by Brazil during the year, with the most outstanding success a trade treaty with Argentina in January and a supplementary agreement on Oct. 6. Under the latter each nation set aside approximately \$20,000,000 for financing the purchase of surpluses, and undertook generally to lower trade barriers. Further efforts to reduce surpluses were attempted through negotiations in the United States, but unwillingness in the United States to depart from traditional short-time credit practices and refusal of barter made for difficulties. Nevertheless, important financial aid from the United States

PRESIDENT VARGAS of Brazil addressing the opening session of the Inter-American Neutrality committee at Rio de Janeiro, Jan. 15, 1940

through a United States Export and Import bank credit and coffee stabilization through the good offices of that country promised eventually far-reaching economic results.

In October, after extended negotiations, the United States Export and Import bank granted a \$20,000,000 loan, with a Brazilian government guarantee, to a newly-organized steel corporation for the erection of a steel-producing plant and rolling mill estimated to cost between \$35,000,000 and \$40,000,000. United States steel mills agreed to lend the services of technical advisers. The steel plant was expected to require two and a half years for construction. Utilizing Brazilian iron ore (approximately 12% of total world reserves) from Minas Geraes state and coal from southern Brazil, it is expected to have an annual capacity of 300,000 to 350,000 tons, adequate to take care of half of Brazil's steel requirements. One of the first effects of the new steel development was expected to be improvement of the roadbed of the Central railway, over which iron ore would be transported.

Inter-American Coffee Quota Agreement.—The perennial coffee problem was met in part by the Inter-American Coffee Quota agreement of Nov. 28, 1940, the product of six months of strenuous effort. Brazil, producer of half the world's coffee supply, and annually compelled to destroy 25% of her crop for lack of market, stood to benefit from the market stabilization expected to result from the quota agreement. Under the agreement, itself an outgrowth of the economic discussions and recommendations of the Havana conference (*see HISPANIC AMERICA AND THE EUROPEAN WAR*), the 14 coffee-producing American republics and the United States, with the objective of promoting the orderly marketing of coffee under terms equitable both to producers and consumers, established quotas for exports to the United States and to other markets and created the Inter-American Coffee board to administer the agreement. Brazil was given an annual quota of 9,300,000 bags of 60kg. (130lb.) each, or 111,000 bags more than the 1939 exportation, out of a total of 15,545,000 bags for export to the United States, and 7,813,000 bags for export to all other markets. The United States, on its part, undertook to restrict its imports from other markets to 355,000 bags annually. The Coffee board was authorized, should changed conditions render it necessary, to increase or decrease the quotas. The agreement is effective until Oct. 1, 1943. To bring production closer to the consumption level uprooting of many coffee plants was proposed, and intensive study was made of the use of coffee in commercial plastics and of coffee oil in soaps. At the same time government policy is to encourage crop diversification.

An important step of the diversified production policy resulted

from Pres. Vargas' Amazon valley tour, from which revival of the rubber industry was expected. Complete modernization of the industry was promised through new tree tapping methods and government aid in supplying machines for the purpose.

Education.—In 1936 there were 36,661 schools with a total enrolment of 2,862,666, a 25% increase in both schools and enrolment. In 1940, 16% of all national expenditures went to education, 70% for primary instruction. Less than 60 cents U.S. per capita was spent on education.

Army and Navy.—The army has a personnel of nearly 100,000. Military service is compulsory. In 1940, the navy included two battleships, two cruisers, a destroyer and numerous smaller craft. During 1940, national defences were materially strengthened.

Finance.—The monetary unit is the milreis (value in Dec. 1940 approximately 5.06 cents U.S.), ordinarily expressed in contos of 1,000 milreis each for large transactions.

On March 8, 1940, debt service on 108 foreign obligations of Brazil and its states and municipalities, aggregating \$1,076,000,000 principal and in default since Nov. 10, 1937, was resumed under a plan which provided for payment of all arrears by March 31, 1944.

Communications.—Under normal conditions Brazil enjoys excellent external communication. The state-owned Lloyd Brasileiro line continued to enlarge its fleet during 1940. Air transport by Pan American airways, connecting Brazil with all parts of America, was improved during the year by the addition of one flight north and south weekly, giving three connections weekly to New York and to Buenos Aires and shortening the time to New York to 36 hours. Former transatlantic flights by German, French and Italian lines were maintained part of the year but abandoned. The German Condor line, however, operated several routes within the country. Domestic lines operated over routes 68,472km. in length. Three daily flights connected Rio de Janeiro and São Paulo.

There are 20,830mi. of railway and over 75,000mi. of highway. Nearly half the railway and over a third of the highway mileage is in two states, Minas Geraes and São Paulo. Communication in the Amazon basin is almost entirely by water, supplemented by air transport. Ocean-going steamers are the chief means of communication between northern and southern ports. Lack of adequate rail and highway facilities within the country is an outstanding weakness, but several notable improvements were begun in 1940. A 6,000km. highway development project in Rio Grande do Sul, costing 70,000 contos, was started. Most important was the Santos to Arica (Chile) railway. It will eventually give transcontinental service through Bolivia to the Pacific (*see BOLIVIA*). Electrification of several routes was continued during the year and considerable new equipment acquired. In 1940 there were 122,101km. of telegraph lines.

Foreign Trade.—In 1939 exports totalled 5,615,519 contos, a 10.2% advance over 1938; imports were 4,983,632 contos, a 4.1% decline. Coffee, the leading export, contributed 39.8% of total values against 45.1% in 1938, raw cotton 20.7% against 18.2%. Hides and skins, and cacao, 4.4% and 4%, respectively, and oranges, carnauba wax, canned meats, lumber, fresh meats and tobacco, contributing from 2.1% to 1.7% each, showed little change. Leading imports were machinery and apparatus (19.9%), iron and steel manufactures (8.9%), wheat (7.1%), chemicals and pharmaceuticals (5.8%), automobiles (5.17%).

The largest physical increase in exports over 1938 was to the United States (16%), the largest proportionate increase to China, whose purchases, practically all in raw cotton, increased 500%. The leading purchasers of exports were: United States, 36.2% (1938: 34.3%); Germany, 12% (1938: 19.1%); Great Britain, 9.6% (1938: 8.8%); France, 6.3% (1938: 6.4%); Argentina,

5.5% (1938: 4.5%); Japan, 5.4% (1938: 4.6%); Netherlands, 3.8% (1938: 4.2%); Sweden, 3.1% (1938: 2.1%); China, 3% (1938: 0.5%); Belgium and Luxembourg, 2.9% (1938: 3.6%).

The greatest increase in import trade was in purchases from the United States, which increased more than a third, the greatest decrease in purchases from Germany. The leading suppliers of imports were: United States, 33.6% (1938: 24.2%); Germany, 19.2% (1938: 24.9%); Great Britain, 9.3% (1938: 10.4%); Argentina, 8.4% (1938: 11.8%); Belgium and Luxembourg, 4.2% (1938: 4%); Netherlands West Indies, 3.4% (1938: 3.2%); France, 2.8% (1938: 4%); Sweden, 2.3% (1938: 2.5%); Italy, 1.8% (1938: 1.8%); Portugal, 1.8% (1938: 1.6%).

European war developments vitally influenced Brazil's foreign trade during 1940, depriving her of several important markets, including the Scandinavian countries, the heaviest European consumers of Brazilian coffee. Including Germany, markets formerly absorbing over 3,000,000 bags of coffee, were lost. In the first ten months of the year exports were 17.3% less than in the corresponding period of 1939, imports 1.2% more. The United States took 39.5% of exports (compared with 34.8% in 1939), and supplied 51.4% of imports (against 30.0% in 1939). In the first 11 months of 1940, imports were valued at 4,606,972 contos, exports at 4,447,497 contos, an unfavourable trade balance of 159,375 contos in contrast with a 764,976 contos favourable balance in the corresponding period of 1939. In Nov. 1940, however, exports exceeded imports.

Agriculture and Mining.—Brazil is primarily and predominantly agricultural. Coffee, of which she produces over half of the world supply, is the greatest single crop. São Paulo especially and other states of southern Brazil depend largely upon coffee. Coffee exports have sharply declined in both volume and value since 1933, when they contributed over 70% of all export values, against 39.1% in 1939. Improvement of the situation, however, was expected from the Inter-American Coffee Quota agreement

(*see above*). In 1939, 16,498,525 bags (of 60kg. each) of coffee were exported, 55.6% to the United States, with France, Germany, Sweden and the Netherlands, next in order. Overproduction has been met by destruction of part of each year's crop. In 1939 only 3,519,874 bags were destroyed, but 9,380,000 bags out of the 20,720,000 bag 1940-41 crop were to be destroyed.

Cotton was of increasing importance. The 1939 crop was valued at 1,159,420 contos (against 32,781 contos in 1933). Nearly 90% was produced in São Paulo state. The 1940-41 crop is estimated as 322,900 metric tons (1939-40: 292,384 tons). Exports in the first nine months of 1940 were 160,561 tons, against 292,971 tons in the same period of 1939. Domestic consumption accounted for 119,000 tons in 1939.

Brazil was the world's fifth largest cotton producer, and was exceeded in maize production (for domestic consumption) only by the United States. Other important agricultural products were rice, sugar, oranges, beans, manioc flour, maté (Paraguay tea). Carnauba wax, used extensively in varnishes and polishes, was of increasing importance, with 70% normally going to the United States. In 1939, 10,001 tons were exported. Under government auspices the quality was being improved. Piahy and Ceará states were the chief producers.

Some 5,000,000,000 board feet of hardwood was estimated to be available. Revival of rubber production was being furthered (*see above*).

The livestock industry was important, especially in Minas Geraes, Rio Grande do Sul and Bahia states. In 1935 there were 40,513,900 head of cattle, 6,051,700 horses, 3,233,000 asses and mules.

Brazil has extensive iron deposits, but lack of transportation has hampered their development. In 1940, however, a huge steel plant was begun (*see above*) with eventual revolutionary effects on Brazilian economy expected. Coal production, centring in the southern states of Rio Grande do Sul and Santa Catherina, increased nearly a third in 1940. Large undeveloped nickel deposits exist in Goyaz. Mineral production in 1939 included: coal, 1,045,975 tons; laminated iron, 98,649 tons; pig iron, 160,016 tons; steel, 112,174 tons; cement, 697,793 tons.

Petroleum production, developed in 1939, was growing rapidly, with an output estimated around 40,000bbl. annually.

Manufacturing.—Manufacturing was in no sense adequate for domestic needs, but received great stimulus after 1934, especially under war conditions. A third of all manufacturing was in São Paulo state. Textiles, the most important manufactured product, account for 24% of industrial production, foodstuffs 22%. In 1939, exports of cheap textiles were valued at \$1,500,000.

Bread and Bakery Products. Further improvement in the nutritive properties of white bread by increasing the content of vitamins and minerals has been the most important development in the U.S. and British baking industries. In Great Britain the government authorized the addition of thiamin (vitamin B₁) and suitable calcium salts to all white flour. In the U.S. the Millers' National federation went on record late in 1940 in favour of the promotion and greater use of "vitamin flour."

White flour in the U.S. is already a good source of dietary calcium, since most commercial white loaves are now made with considerable amounts of milk solids. The average loaf (other than the French and Italian varieties) contains about 6% milk solids on the basis of the flour used. This amount of whole or skimmed fluid, condensed, or dried milk in the bread formula not only increases calcium, in favourable ratio to phosphorus, but also adds to the loaf good proteins and a considerable amount of riboflavin (vitamin B₂).

The vitamin B₁ or thiamin content of commercial white bread in the U.S. is being increased to the equivalent of that of 100% whole wheat by the use of special high-vitamin yeast, by the direct addition of crystalline vitamins and wheat germs to the dough, and by the use of white flour in which this vitamin has been retained or to which it has been added.

According to the biennial census of manufactures of the U.S. department of commerce (preliminary report), the number of baking establishments in that country doing \$5,000 or more business in 1939 was 18,049. These concerns employed an average of 201,537 wage earners, who were paid \$262,000,268. The cost of supplies was \$567,443,736 and the total value of the products was \$1,211,395,278. Of the entire number of baking establishments, 2,569 were wholesale only, 8,980 were retail only and 6,500 were wholesale and retail combined. (See also FLOUR AND FLOUR MILLING.) (J. A. To.)

Brewing and Beer. The generic word beer covers the malt beverage group including beer, ale, porter, etc. In 1940 the product was manufactured in 40 states and sold in all of the states under regulation and licence. It is taxed by the federal and state governments, and in scattered cases local taxes are imposed. Aside from taxation, control is vested in the states, which generally treat beer distinctly from liquors because of its low alcoholic content.

The industry's production and sales statistics are based on United States internal revenue reports of tax-paid withdrawals (sales) based on the United States fiscal years ending June 30. As cited here, the reports cover the period since beer's re-legalization by act of congress effective April 7, 1933 (which preceded the effective date of repeal of the prohibition amendment by 8 months). On June 30, 1940 there were 572 breweries as compared with the peak of 750 in 1935.

Sales Records.—Following are the sales records in United States barrels (31gal.) by fiscal years ending June 30th: 1933 (85 days) 6,277,728; 1934, 32,266,039; 1935, 42,228,831; 1936, 48,759,840; 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014,230.

Federal reports, subject to minor correction after final audit, show tax-paid withdrawals for the six months July-Dec. 1940 totalling 26,904,571 barrels. Per capita consumption was 12.5gal. in 1940 as compared with 12.3 in 1939.

Features of the calendar year 1940 included: sales increases of 226,000bbl. during the first six months over the same period in 1939; sales decline of 1,205,371bbl. during the last six months over the same period in 1939; imposition July 1 of an additional emergency tax of \$1 per bbl. for national defence; industry ac-

tivities to "clean up or close up" law violating retail outlets.

Law Observance.—The industry's nation-wide program, being conducted through the United Brewers' Industrial foundation, by the end of 1940 was being applied intensively in 14 states through committees of brewers and beer distributors, which worked directly with retailers and the public authorities to protect the good repute of beer and brewing from abuse by a minority of law violators. These committees reported 22,000 investigations of retail outlets to the end of 1940 and 2,600 warnings resulting in some 1,200 voluntary corrections of improper conditions and nearly 1,000 licence revocations and other legal actions.

Market Conditions.—With the imposition of the emergency defence tax, the total federal tax became \$6.00 a barrel. This, plus state and local taxes, which together place an average levy of \$8.50 on each barrel of beer, gave the industry an immediate problem of increased prices and a disturbed market condition which was considered mainly responsible for the marked decline in beer sales during the second half of 1940. Package sales, considered significant of increased home use, continued to gain in 1940 when nearly 51% of all beer was sold in bottles or cans. In 1934 the percentage was 25% package against 75% draught.

Taxes.—Federal excise and special taxes on beer for the fiscal year 1940 totalled \$267,776,187. Cumulative federal taxes since re-legalization totalled \$1,754,701,952. State and local taxes for that period are estimated at \$700,000,000, bringing the combined public revenue from beer to approximately \$2,450,000,000 for the period from April 7, 1933 to June 30, 1940.

The European war disrupted world-production and consumption reports for this industry. (H. Hy.)

Brick. The revival of the building industry is increasing the demand for all types of building materials to such an extent that brick production in the United States has more

Brick Production in the United States
(In millions)

Type of Brick	1936	1937	1938	1939
Common	2,966.5	3,252.6	2,729.9	3,408?
Face	848.8	937.6	803.1	1,085?
Hollow	8.4	5.3	7.3	?
Salt-glazed	48.6	51.0	43.0	?
Vitrified	88.9	90.2	94.1	76?

The Tacoma Narrows bridge at Puget Sound, Wash., built at a cost of \$6,400,000, with a main span of 2,800 ft. (the third longest in the world), was completed and dedicated July 1, 1940. On Nov. 7, 1940, the structure was wrecked in a 42-mi. wind which caused a vertical wave motion of opposite phase in the two sides of the bridge, producing a cumulative twisting (28 ft. high) of destructive magnitude. The failure was charged to aerodynamic instability of the design. It was by far the most slender suspension bridge ever built, both laterally and vertically, the width between cables being only 39 ft. (or 1/72 of the span) and the depth of the stiffening girders only eight feet (or 1/350 of the span).

The Howrah bridge over the Hooghly river, India, under construction 1938 to 1940, is a cantilever bridge costing £1,750,000.

The Story bridge over the Brisbane river, Queensland, under construction 1935 to 1941, at a cost of £1,600,000, with a cantilever span of 924 ft., is a government-owned toll bridge and the second longest span in Australia.

The Rainbow bridge at Niagara Falls, with a 950-ft. steel arch (the fourth longest arch span in the world), was commenced in May 1940 to replace the old arch bridge of 840-ft. span which was wrecked by the ice in Jan. 1938. The end pins are located 29 ft. higher. The new span, costing \$4,000,000, will be a publicly owned and operated toll bridge under an international commission.

Four new bridges over the Mississippi river were completed in 1940: at Baton Rouge, La. (cantilever—railroad and highway—\$8,500,000—two 858-ft. spans); at Natchez, Miss. (cantilever—\$3,450,000—two 875-ft. spans); at Greenville, Miss. (cantilever—\$4,500,000—840-ft. span); and at Rock Island, Ill. (\$2,500,000—five tied-arch steel spans, two at 539 ft.). All but the last are toll bridges.

A cantilever toll bridge over the Ohio river at Owensboro, Ky., completed 1940 at a cost of \$1,730,000, has a main span of 751 ft.; and one at Jamestown, R.I., completed 1940 at a cost of \$3,000,000, has a main span of 640 feet.

Four bridges using the Wichert continuous type of construction were completed in 1939–41: one over the Susquehanna river at Havre de Grace, Md. (1940), \$4,500,000, 7,618 ft. long, with 36 Wichert truss and girder spans, including two arch-shaped Wichert trusses of 456 ft. span; one over the Potomac river at Ludlow Ferry, Md. (1941), \$5,500,000, two miles long, including an 800-ft. cantilever span (with piers on steel piles 150 ft. long to rock 200 feet deep) and 22 Wichert approach spans (longest truss spans 350 ft., longest girder spans 162 ft.); one over the Potomac river at Hancock, Md. (1939), \$1,000,000, with 20 Wichert truss and girder spans; and the Wilmot street bridge at Pittsburgh (1940) with three Wichert truss spans (longest 360 feet).

The Thomas A. Edison bridge over the Raritan river at Perth Amboy, N.J., built 1939 to 1940 at a cost of \$4,670,000, is of continuous plate girder construction, with one span of 250 ft. and eight spans of 200 feet. Also completed 1940, one of the approaches to the new Main avenue bridge in Cleveland, O., has a steel girder span of 271 ft. (the longest plate girder span in the U.S.). This will be exceeded by the new Hartford bridge over the Connecticut river with three continuous steel girder spans of 270, 300 and 270 ft., under construction 1940 to 1942 at a cost of \$2,000,000.

The concrete pontoon bridge across Lake Washington in Seattle, built by the state of Washington toll bridge authority at a cost of \$8,500,000, was dedicated July 2, 1940. The floating portion 6,561 ft. long is made up of 25 precast cellular reinforced concrete pontoons, 117 to 378 ft. long, 59 ft. wide and 14½ ft. deep, floating seven feet out of water, with a central 202-ft. opening for ships, provided by a sliding indrawn floating span. A second concrete pontoon bridge is under construction at Hobart, Tasmania; and at Istanbul, Turkey, the Golden Horn is now spanned by a steel pontoon bridge 1,500 ft. long.

A new highway bridge over the Black river at Lorain, O., has a double-leaf bascule span of 333 ft., the second longest in the world.

THE TACOMA NARROWS BRIDGE collapsed in a windstorm Nov. 7, 1940, and fell into Puget sound, Washington. Completed only four months before, it was the third longest single suspension bridge in the world. None was killed in the accident

LAKE WASHINGTON BRIDGE at Seattle, Wash., longest floating bridge in the world, was dedicated and opened July 2, 1940. It stretches for almost a mile and a half on steel and concrete pontoons across the lake

In line with the trend toward public ownership and operation of toll bridges, two notable privately owned bridges were purchased by the states in 1940: the Carquinez strait bridge (cantilever, built 1927) purchased by California for \$6,480,000; and the Bear mountain bridge (suspension, built 1923) purchased by New York state for \$2,275,000.

The world's longest spans in 1940 are listed in Table II.

(D. B. S.)

Briquettes, Fuel: see FUEL BRIQUETTES.

British Borneo: see BORNEO.

British Columbia, the western province of the Dominion of Canada, covers an area of 366,255 sq.mi., being equivalent in size to the United Kingdom, France, Holland, Belgium and Denmark combined. The population of the province, 774,000 (1939), is concentrated in the southwestern part of the province, mainly in the cities of Vancouver, Victoria and New Westminster. Of this population about 47,900 are orientals, 26,300 being Japanese and 21,600 being Chinese. About 90% of the Japanese and 60% of the Chinese in Canada reside in this province.

History.—Early in the year the report of the Royal Commission on Dominion-Provincial Relations was released by the Canadian prime minister. This report, commonly known as the Rowell-Sirois report, awarded the sum of \$750,000 to the province of British Columbia in settlement of various claims against the dominion government. The report proposed a major revision in existing dominion-provincial financial arrangements, including the transfer of certain important sources of revenue—including income tax and succession duties—from the province to the dominion. Members of the opposition sought to ascertain the views of the provincial government on these questions during the fall session of the legislative assembly, but no official pronouncement was made at that time. The provincial government has consistently protested the entry of the dominion government into the income tax field. Premier T. D. Pattullo announced that his government had accepted the invitation of Prime Minister Mackenzie King to attend the Dominion-Provincial conference in Ottawa during Jan. 1941, to discuss the recommendations of the Rowell-Sirois report.

A second event of importance occurred in April when the verdict of the supreme court of Canada gave the government of British Columbia authority to proceed with the regulation of the sale of petroleum products. The oil companies were notified by the provincial government that fixed prices would become effective April 24.

As a result, the oil companies, on April 26, suspended the sale of gasoline to retailers throughout the entire province. A compromise settlement was finally effected after a week of this gasoline strike, establishing the wholesale price of gasoline one cent above the price set in the disputed governmental order. Subsequently, the provincial government called a special session of the legislative assembly, and at this time passed the Coal and Petroleum Products Control Board Act, Amendment Act 1940, which would permit the provincial government to enter in and operate all branches of the petroleum industry.

Only legislation of minor importance was enacted at the fall session of the legislative assembly. In presenting his budget to the legislative assembly in November, Finance Minister John Hart stated that the province would refrain from the introduction of new tax measures during the war in order to conserve the national income for the maximum war effort. Mr. Hart reported that revenue collections amounting to \$32,826,438 during the year ended March 31, 1940, had exceeded all previous records. The finance minister, forecasting a revenue surplus of \$2,010,184, estimated that provincial revenues would reach \$31,957,391, and ordinary expenditures \$29,947,207, during 1941-42; as compared with an estimated revenue of \$29,300,141 and an expenditure of \$29,268,790 for the fiscal year 1940-41.

Several prominent British Columbia citizens were called to the federal capital to serve with the war effort. H. R. MacMillan, Vancouver, was appointed timber controller for Canada in June, and was given the additional position of chairman of the War Requirements board in November. J. P. D. Malkin, Vancouver, was appointed director-general of purchases under the department of munitions and supply.

Industries.—British Columbia experienced a period of intense business activity during 1940. Federal marketing assistance relieved the anxiety of fruit-growers whose markets were adversely affected by United Kingdom import restrictions. Shipbuilding was stimulated in the coastal area as a direct result of the war, and other branches of secondary industry were similarly affected. Lumber shipments to the United Kingdom were well maintained, in spite of shipping difficulties. Arrangements were made early in February for transcontinental rail shipments of British Columbia lumber to exporting points in Eastern Canada. All basic industries, according to preliminary estimates, registered gains over the preceding year. The gross value of production amounted to \$57,500,000 in agriculture (1939, \$49,402,000); \$18,726,000 in fisheries (1939, \$17,700,000); \$97,500,000 in forestry (1939, \$88,221,000); and \$72,000,000 in mining (1939, \$65,682,000).

(G. N. P.)

British East Africa. Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns, status and governors. (See also separate heading, RHODESIA.)

History.—Till the summer of 1940 British East Africa lay outside the theatre of war, since Germany was the only enemy and possessed no bases for launching an attack on an area so far from Europe. But it was well understood that at any moment Italy might decide to throw in its lot with Germany, and in Eritrea and Italian Somaliland and recently conquered Ethiopia Italy was British East Africa's immediate neighbour. From the outbreak of the war, therefore, these British territories, Kenya and Uganda in particular, were more concerned with immediate military needs than any other part of the British overseas empire. They took the same measures of internal security as other colonies, such as internment of enemy aliens; and, like other colonies, they mobilized their economic resources in aid of the common war-effort, on

*Including Uganda.

a broad co-operative basis. Conferences were held by the governors and the directors of agriculture of Kenya, Uganda and Tanganyika; technical committees were established to study the possibilities of the local manufacture of war materials; at a later stage an East Africa economic council was projected for dealing with all matters of common concern; and in October representatives of all the territories attended the viceroy's conference at Delhi which met to organize war supplies on the widest possible basis—to establish, in fact, one economic British empire front running from South and East Africa through the middle east to India and thence to Malaya and Australasia. In this joint economic effort each territory took what part it could.

Kenya's chief contribution was the production of coffee, wool, sisal and flax. New factories were built for treating flax, for weaving blankets, and for making boots from local leather. Uganda provided cotton, rubber, coffee, sisal and tin, and began the manufacture of power alcohol from sugar, and diesel oil from cotton seeds. Mandated Tanganyika increased its output of sisal and cotton. Similar efforts to expand production were made in the little island protectorate of Zanzibar and in Mauritius and the Seychelles in the Indian ocean. All these territories, mainland and islands alike, were contributing at the same time to the cost of the war. By the autumn of 1940, the total of "war gifts" made by them, officially and privately, amounted to over £400,000. Two particular items deserve to be mentioned: the Kikuyu, Kamba and Meru tribes in Kenya gave £10,000, and the chiefs and peoples of Teso in Uganda £6,000, for the making of aircraft for the royal air force.

Meantime, the territories had been arming themselves to meet the possibility of an Italian attack. In peacetime the military force in all British East Africa amounted to only some 1,200 African soldiers with 47 British officers (the King's African Rifles). This was rapidly expanded by voluntary recruitment, and further volunteer defence units, both British and African, were enlisted. As the year drew on, reinforcements arrived in Kenya from South Africa, Rhodesia, Nigeria and the Gold Coast, so that, when Italy entered the war in June, it was confronted in

Kenya with a small but fast-growing army and air force drawn from most of the African territories of the British empire. Its role was necessarily defensive for the time being, in face of the much greater strength of the Italian forces, and, after a gallant rear-guard action at Moyale, the British outposts were withdrawn from the arid belt which lies along Kenya's northern frontier. The collapse of France and the acceptance of Pétain's armistice by the governor of French Somaliland necessitated a similar retreat in British Somaliland, for it was now exposed to attack from the flank which the French had hitherto protected.

The invasion began on Aug. 4 by three routes. The Italians used the greater part of two divisions, including mechanized forces. The small British forces on both fronts retreated on Berbera and on Aug. 19 it was announced that they had been withdrawn without loss by sea.

(R. Co.)

British Guiana, a British crown colony in northeastern South America; language, English; capital, Georgetown; governor, Sir Wilfred E. F. Jackson. The area is 89,480 sq.mi.; the population (1931 census, 310,933) was officially estimated at 337,521 in 1938, with East Indians and Negroes comprising 42% and 38% respectively. The chief cities are Georgetown (67,584) and New Amsterdam (9,514).

History.—During 1940 the legislative council voted, as an aid to the prosecution of the war in Europe, to forego the imperial grant-in-aid of \$250,000. Voluntary contributions were made in excess of £42,500 to buy military aircraft for the empire.

In Sept. 1940 the "destroyer, naval and air-base agreement" between the United States and Great Britain made available to the former a site (to be selected later) within 50mi. of Georgetown for establishment and use as a naval and air base which, it was understood, would be at or close to the mouth of the Essequibo river.

Late in the year, United States experts visited the colony to select a site for the base. (See WEST INDIES, BRITISH.)

Despite war conditions the program of economic development was continued during the year, with expenditures by the imperial government of nearly £190,000 for road construction to the gold and diamond fields, purchase of dredging equipment and geological surveys. A strong drive to make the colony more nearly self-sufficient in foodstuffs was pressed during the year.

Transportation.—There are 79mi. of railway, along the coast, 322mi. of main highway, and several important navigable rivers, which are, however, interrupted by falls and rapids. An aerial survey of water routes to the Rupununi district in the southern highlands was made in 1940, and several alternative plans for canalization around rapids submitted. Other proposed transportation projects to this area included a railway and a combined rail-water transit. Plans for settling European refugees in the area, which were in progress in 1939, were temporarily shelved owing to war conditions.

Agriculture, Mining and Manufacturing.—In 1939 imports (foodstuffs, manufactured goods and lumber) valued at 10,807,506 British Guiana dollars (a 1.7% increase over 1938) came largely from Great Britain (45.3%), Canada (18%), United States (14.3%) and British West Indies (4.3%). Exports (sugar products, 60%; bauxite, 19.6%; gold, 7.2%; rice, 31.9%; diamonds, 2.9%; balata, 1.4%) aggregating 14,525,780 British Guiana dollars, a 10.9% increase, were taken by Canada (50.9%),

Great Britain (34.8%), United States (5.7%) and the British West Indies (5.4%). In the first four months of 1940, exports rose 35.5% in value, imports 55%. The export commodities are the principal products. The colony is the second largest sugar producer in the British empire, and one-third of the population derives its livelihood from sugar production. Forests cover 84% of the area. It is estimated that 19,000 sq.mi. of forest are readily accessible to exploitation. During 1940 considerable attention was given to possible pulp wood development.

Finance.—The monetary unit, the British Guiana dollar, normally equal to the U.S. dollar, was at approximately 17% discount during most of 1940.

Education.—There are 239 primary schools (1938 enrolment, 53,373) and seven secondary schools maintained at an annual cost of over \$500,000.

(L. W. BE.)

British Honduras, British crown colony in northern Central America; language, English; capital, Belize (pop. 16,687 in 1931); governor, Sir Alan C. Maxwell Burns. The area is 8,598 sq.mi. The population (1931 census: 51,347) was officially estimated at 58,759 as of Dec. 31, 1939. British Honduras's boundaries with Guatemala were settled by treaty in 1859; the question was reopened by the latter in 1939 and, in Jan. 1940, the British government offered to submit the matter to arbitration (see GUATEMALA).

Early in 1940 arrangements were made for the settlement of 80 European refugee industrial families at Ericatown in the west central highlands. They were expected to engage in specialized handwork.

The colony has direct maritime communication with New Orleans and Jamaica and, normally, with England. External air communication by a Mexican line to Mérida (Yucatan) connects with Pan American airways.

Domestic air service links Belize, British Honduras, with several interior points. In 1940 there were 25mi. of railway and more than 200mi. of motor transport.

British Honduras is an important trade intermediary between the Mexican territories of Yucatan and Quintana Roo and the United States, with re-exports valued at 1,138,081 British Honduras dollars in 1939. Total imports in 1939 (reported in British Honduras dollars) were \$3,532,059 (a 12½% decrease), from the United States (32.5%), Mexico (27.6%, including re-exports) and Great Britain (15.9%). Total domestic exports were \$1,381,-

116 BRITISH LEGION—BRITISH MEDITERRANEAN POSSESSIONS

593 (23.9% less than in 1938), nearly all to the United States (66.1%) and Great Britain (27.8%). From Jan. 1–June 30, 1940, imports decreased 15.7% over the corresponding period of 1939, while domestic exports and re-exports increased 16.7% and 35.7% respectively. The principal domestic exports are mahogany logs (31.52% in 1939), mahogany lumber (18.52%), bananas (13.51%), chicle (20.31%), grapefruit (5.91%) and coco-nuts (2.54%). These commodities, rice, sugar and corn grown largely for local consumption, are the principal products. The principal re-exports of Mexican origin are mahogany and chicle. In Sept. 1940, the British ministry of foods purchased the entire 1940 grapefruit crop, estimated at \$100,000 in value.

The monetary unit, the British Honduras dollar, valued at 4.8665 to the pound sterling and normally equivalent to the U.S. dollar, was valued at 83 cents U.S. under exchange rates prevailing in 1940. The colony has 106 elementary schools, with a total enrolment of 10,021 in 1938 and five secondary schools, with an enrolment of 456. (L. W. BE.)

British Legion. At the outbreak of war in 1939 the legion offered all its available resources to the government, and thousands of its members rejoined the forces while tens of thousands, both men and women, actively assisted the war effort in the home defence services, as guides at the London termini, in canteens and in other ways.

The removal of national headquarters from London to Richmond was much criticized by the metropolitan area conference in February, and as spiritedly defended by the chairman, Major Sir Francis Fetherston-Godley. At that time the criticism seemed to have some justification, but after-events left little doubt that the move was wise and saved the legion for its main purpose which, during 1940, it not only fulfilled but extended.

The queen was present at the women's section conference (April 17); at the annual national conference (May) Colonel A. S. Ashwanden succeeded as chairman and a resolution urging the suppression of the Peace Pledge union was carried unanimously after the meeting had been addressed by Dr. Benes, Gen. A. Lelong, French military attaché, M. Antoni Jazdzewski, counsellor to the Polish embassy, and the Norwegian minister, M. Colban.

The 1939 Poppy Day collection amounted to £537,699, and in June 1940 the *Poppy Annual* was issued on behalf of the Earl Haig Poppy Day fund.

British Medical Association. Its peacetime activities largely suspended, the British Medical association concentrated during 1940 on the work of the Central and Local Medical War committees, which, planned by the association at the government's request before the war, supplied the doctors for the fighting services and for the civilian population, including the medical care of air-raid casualties, of unaccompanied children evacuated to the country, and of the public in air-raid shelters.

A Medical Planning commission, representative of all medical

interests, was set up by the association during 1940 to study wartime developments and their effects on the country's medical services at the time and in the postwar era.

British Pacific Islands: see PACIFIC ISLANDS, BRITISH.

British Possessions in the Mediterranean.

These comprise Cyprus, Gibraltar and the Maltese islands of which the table below gives certain statistics. The entry of Italy into the war in June 1940, followed by the collapse of France, brought the British possessions in the Mediterranean into the centre of hostilities.

All the women and children were evacuated from Gibraltar, and a number from Malta. The former city was subjected to some air raids, notably on Sept. 24 and 25 when French aircraft from Morocco dropped bombs in reprisal, it was stated in Vichy, for the attack on Dakar.

THE GREAT STRATEGIC IMPORTANCE of Gibraltar was enhanced after the fall of France in 1940. This map shows how it commands the western entrance to the Mediterranean

Raids on Malta by Italian aircraft were numerous, but the island was brilliantly and successfully defended by R.A.F. fighters and anti-aircraft batteries, while the fortitude and loyalty of the Maltese won general admiration. A number of its islanders were in 1940 serving in the royal navy.

Cyprus suffered less from the direct impact of the war, but active measures for defence were taken, and the news that Cypriots were the first colonists to serve in France led to the enlistment of thousands of volunteers.

Following the arrival of the new governor, W. D. Battershill, in Aug. 1939, a wartime economy for the island was immediately devised. In order to help agriculture, the basic industry of the island after mining activities contracted so much on account of shipping difficulties, the British government offered to buy the whole of the 1940 carob production, amounting to about £140,000 at a certain price, according to districts, which ensured, therefore, a minimum price for producers. Actually it appeared that by the play of competition local merchants were buying a large proportion of the crop at prices higher than those offered by the government, so that the latter would probably not have to take over such

a large proportion of the crop as was at first anticipated. The government also planned to buy the raisin crop, amounting to about £50,000.

The island had many problems ahead. Its important export and import trade suffered through the restrictions in the Mediterranean, but it was hoped that the government would give the necessary assistance to producers of other major products. It was, moreover, possible in spite of war conditions to continue with work on anti-erosion, and with the rural development scheme initiated in 1936.

Generous contributions were made by all the islands to funds for fighter planes and mobile canteens.

History.—As in other parts of the British commonwealth, so in the three South African territories—Basutoland, Bechuanaland and Swaziland—1940 was a year of war effort. Nowhere was there a stronger sense of loyalty to the common cause. In all three territories the desire to take part in the actual fighting was only checked by the lack of local facilities for training and equipment. Equally striking was the eagerness of these poor and backward little countries to make their contribution to the economic and financial sinews of war. A campaign for growing more foodstuffs was set on foot and many acres of untilled land were put under the plow. Increases in taxation were willingly accepted by the chiefs and their peoples. Expenditure was drastically curtailed. As a result, the amount of the "grant-in-aid" voted by the British parliament to assist the strained finances of Bechuanaland was reduced by £22,000. Basutoland, which is better off than the other two territories but needs all her funds in ordinary times to conserve and develop her mountain soil, actually made a gift of £100,000 to the British government. In all three territories, moreover, war funds were opened for private subscription on the outbreak of war; and, by the autumn of 1940, the sums remitted from those funds to the British gov-

ernment or various war organizations in Britain amounted to over £30,000.

(R. Co.)

British West Africa. Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the table on this page. See BRITISH EMPIRE for population, capital towns, status and governors.

(X.)

History.—The record of British West Africa in 1940 was necessarily a war-record, and its outstanding feature was the manner in which, in all its four territories, Nigeria, Gold Coast, Sierra Leone and Gambia, the popular enthusiasm for the cause for which they were fighting as units of the British commonwealth was not only sustained but grew stronger as the months went by. When France collapsed in the summer, there was no whisper of "defeatism." On the contrary, from all the territories came renewed declarations of loyalty to the common cause.

This universal response to the call of the war took concrete shape in three main ways. First, the stream of recruits for military service was steadily maintained. Thus the royal West African frontier force, which in peace time only numbered about 5,000 officers and men (320 British) was substantially strengthened, and it proved possible to send units of it from Nigeria and the Gold Coast to join the forces gathering in Kenya for the defence of British East Africa from Italian attacks. Secondly, the British West Africa peoples not only willingly accepted increases of taxation, but contributed, both through their governments and by private gifts, to the various war

funds of Britain sums which by the autumn had already reached a total of £450,000. Thirdly—and this was British West Africa's most important contribution to the war—measures were taken not only to prevent the economic resources of the four colonies from being tapped by the axis powers, but also to expand by increased cultivation and intensified mining the amount of raw materials available for Britain. Among the chief products of this area are ground nuts, palm kernels and palm oil, all of the highest value both for foodstuffs, such as margarine, and for lubrication. The Gold Coast and Nigeria grow 45% of the total world supply of cocoa. The output of tin from Nigeria is nearly one-fifth of that from Malaya. The Gold Coast is the third

largest producer of manganese in the world. In stimulating the production of these and other commodities needed for the war the British government played the part of purchaser. It bought the whole of the year's cocoa crop at a price roughly £2 per ton higher than the average price of 1938–39. It bought the Nigerian output of ground nuts, palm oil and palm kernels. These purchases helped compensate for loss of other foreign markets. (R. Co.)

Broadcasting: see RADIO, INDUSTRIAL ASPECTS OF; RADIO, SCIENTIFIC DEVELOPMENTS OF.

Brooke, Sir Alan Francis (1883–), British soldier, was born at Baguères de Bigorre, France, on July 23, the son of Sir Victor Brooke. After completing his studies at the royal military academy, Woolwich, he joined the royal field artillery in 1902. He was stationed in Ireland from 1902 to 1906, then India. At the outbreak of war in 1914 he went to France, where he commanded an ammunition column. Advancing rapidly, he was soon recognized as a foremost British authority on artillery and was a general staff officer of the royal artillery at the time of the armistice. After the war he joined the staff college, Camberley, and the imperial defence college, and from 1929 to 1932 he was commandant of the school of artillery. After duty at various other military posts he was appointed in 1939 commander-in-chief of the anti-aircraft command.

When Germany invaded the Low Countries on May 10, 1940, Brooke was commander of the B.E.F. 2nd corps in France. His brilliant guarding of the British retreat from Flanders was an important factor in the successful evacuation at Dunkirk. Back in England early in June, he hastily reassembled British military manpower for the expected nazi invasion and prepared a formidable series of defence zones. For his work in Flanders he was knighted, and on July 19 he was appointed to succeed Sir Edmund Ironside as commander-in-chief of home forces.

Brookings Institution. The research program carried on at the Brookings institution during the calendar year 1940 included studies of many important problems in the fields of economics and government. Among those completed were the following: *Federal Control of Expenditures*, by Fred W. Powell, a compilation of material underlying the nation's financial history prior to 1894; *Labor Relations in the Automobile Industry*, by William H. McPherson, a study of the development of union organization; *The Federal Financial System*, by Daniel T. Selko, a study of the problems of government financing; *Wartime Control of Prices*, by Charles O. Hardy, an analysis of the factors involved based on the nation's experience in the World War of 1914–18; *Union Policies and Industrial Management*, by Sumner H. Slichter, a study of the evolution of shop rules and practices under which labour and management have developed an orderly system of labour jurisprudence; *How Nazi Germany Has Mobilized and Controlled Labor*, by L. Hamburger, an analysis of the growth of labour regimentation; *Federal Regulatory Action and Control*, by Frederick F. Blachly and Miriam E. Oatman, an investigation of the operation of federal administrative and quasi-judicial agencies; *Government and Economic Life*, vol. ii, by Leverett S. Lyon, Victor Abramson and associates, the concluding volume of a study of the relationship of government to private enterprise.

Twenty fellowships for work in the social sciences were granted to advanced graduate students for 1940–41. (H. G. Mo.)

Brush, Matthew Chauncey (1887–1940), U.S. corporation official, was born in Stillwater, Minn., and was graduated from the Massachusetts Institute of Technology in 1901.

That year he was employed by the Union Pacific Railroad Company as a machinist. In 1904 he was employed by the street railroad company of Newton, Mass., and later by the street railroad system in Buffalo. In 1910 he was made assistant to the vice-president of the Boston elevated railroad, rising to the presidency in 1916. He was president of the American International Shipbuilding corporation at Hog Island, Pa., from 1918 to 1921. At the same time he was connected with the American International corporation, an investment trust of which he became president in 1923. He died in New York city Oct. 15.

Bryn Mawr College. Bryn Mawr college is a resident college for women at Bryn Mawr, Pa. The 1940–41 enrolment of 654, the largest in the college's history, includes 152 graduate students and 502 undergraduates. The faculty and teaching staff number 102. In Oct. 1940, the Quita Woodward wing of the library was opened. This increases the stack space of the library by one-third, and adds a recreational reading room, an art gallery, an archaeological museum, art classrooms, seminars and offices. The Mary Paul Collins scholarship for foreign women, awarded in the furtherance of a research project in the graduate school, was offered in 1940 in anthropology, and the project is on the subject of religion as a projection of the social order. The Anna Howard Shaw lectures, given by a visiting lecturer, were also in the field of anthropology in 1940. (M. E. PA.)

Buchan, John: see TWEEDSMUIR, 1ST BARON, OF ELSFIELD.

Buckwheat. The 1940 crop of buckwheat was the second smallest of record in the U.S. and was reported by the department of agriculture in Oct. 1940 as 6,048,000bu., compared with 5,739,000bu. in 1939, which was the smallest crop in 75 years. The ten-year average production (1929–38) was 7,617,000 bushels. For ten years (1931–40) U.S. farmers planted smaller acreages to buckwheat than formerly.

The average yield per acre in 1940 was 16.2bu., compared with 15.1bu. in 1939.

(S. O. R.)

Budgets, National. A national budget sets forth the expenditures and receipts of the government and a balanced statement showing the condition of the government's finances at the end of each period. For example, in the United States the Budget and Accounting act of 1921 provided for a national budget system and created a bureau of the budget to prepare for the president the budget of the United States government. The act directs the president to submit to congress on the first day of each regular session a budget which presents the expenditures and receipts of the federal government for the fiscal year just completed, estimated expenditures and receipts

for the current and ensuing fiscal years and balanced statements showing the condition of the treasury at the end of each of these periods. The budget document also includes discussion of the financial condition of the government and recommendations on the many aspects of government fiscal policy.

The budgets of all the major world powers and of many smaller nations were in 1940 geared to the requirements of modern war or national defence. Expenditures for military and naval purposes dominated the outlays of these budgets, and, since expenditures were not financed entirely from revenues, most national budgets showed huge deficits. New taxes were imposed, of substantial magnitude in many cases, but in most countries it was thought inexpedient or undesirable to meet total government requirements by taxation. These deficits will in all likelihood continue to increase until destructive and chaotic world conditions are terminated. And even if peace were achieved it is not certain that world economic conditions would be such as to make balanced budgets possible for most countries.

It will be necessary to make the transition from a war economy to a peace economy, to put soldiers back to work in private industry and once again to shift industry from the production of armaments to the production of civilian goods and services. This transition will be difficult and will require great skill and ingenuity even with the aid that can be given by the financial resources of government. Without those resources the adjustment would undoubtedly entail considerable economic and social disorganization.

United States.—During its 20-year history the federal budget of the United States has mirrored the changing role of the government in the economic and social life of the nation. In the years immediately following its inception, the budget was conceived primarily as a device for predetermining that estimated revenues in the coming year would cover contemplated expenditure and, perhaps, allow some liquidation of the national debt. While it was recognized by some economists and others that government fiscal operations could influence general economic conditions, considerations of this nature did not enter into budget making. The government's budget was thought to be similar to an individual's—it assisted in the allocation of revenues to most useful functions and in revealing functions upon which economies could be effected. In the prevailing economic ideas of the day, such control of general economic conditions as might be necessary was thought to be a responsibility of the central banking system, operating through its traditional instruments of monetary policy.

This conception of budget policy sufficed for the almost continuous prosperity of the postwar decade. Even with the onset of the economic depression in late 1929, these ideas were dominant. The budget became unbalanced after 1930 because government revenues declined drastically as the national income fell off, rather than through any act of budgetary policy. The Federal Reserve system attempted to stem the deflation by lowering the banks' rate of interest and by engaging in extensive open market operations. Despite these and other measures business continued to sink deeper into depression and the government deficit continued to mount.

In its early days the administration of Franklin D. Roosevelt followed essentially the fiscal policy of the preceding regime; in fact, it applied the conventional budgetary ideas more drastically, for one of its first official actions was a sharp cut in many items of government expenditure in an effort to bring the ordinary budget closer into balance. As the inventory boomlet of the summer of 1933 failed to blossom into real economic recovery, however, the administration abandoned fiscal orthodoxy and embarked upon what became a new conception of the role of government fiscal policy under conditions of economic depression. This policy was the use of government spending to provide re-em-

"ANOTHER PLOW-UNDER," by Elderman of the *Washington Post*

ployment. It was soon recognized to involve an unbalanced budget as a stimulus to economic activity. In the years that followed, every budget contained substantial sums for such items as work projects, power facilities, public highways, schools, recreation facilities, public buildings and others.

The budgets from 1934 on differed from those of previous years in another important respect. They reflected the many new social responsibilities undertaken by the federal government during these years, some of which represented functions formerly assumed only by state and local government units and others of which were entirely new to government in this country. In consequence, the budget came to contain provisions for relief, social security, railroad retirement, slum clearance, aids to youth and other activities.

What the changes wrought by the New Deal meant in the economic and social life of the nation is suggested by a comparison of the budget before 1933 with some later year. For example, in the fiscal year 1931 federal government expenditures totalled approximately \$3,671,000,000, whereas in 1939 the total was \$8,707,000,000. In part this rise was due to increased outlays for functions and expenses existing in 1931, such as national defence, the legislative, judicial and civil establishments, public highways, improvement of rivers and harbours, flood control, interest on public debt, etc. In the main, however, it resulted from the new activities of the federal government, such as the Agricultural Adjustment program, \$782,000,000; social security, \$374,000,000; railroad retirement, \$110,000,000; Tennessee Valley authority, \$41,000,000; grants to public bodies for public works, \$379,000,000; direct relief, \$104,000,000; work relief (WPA, etc.), \$2,283,000,000; and the Civilian Conservation Corps, \$290,000,000. Expenditures for these items in the fiscal year 1939, totalled \$4,363,000,000.

Concurrently with this rise in expenditures there was an increase in government revenues derived from various new taxes, higher rates on existing taxes and increased receipts flowing

Table I.—Budget Statement Sent to Congress by Pres. Roosevelt Jan. 8, 1941
General and Special Accounts

	Est., Fiscal Year 1942	Est., Fiscal Year 1941	Actual, Fiscal Year 1940
I. Receipts:			
1. Revenues:			
Internal revenue	\$8,500,135,000	\$6,817,210,000	\$5,203,133,088.29
Railroad Unemployment Insurance Act	7,200,000	0,800,000	4,918,040.78
Customs	295,000,000	302,000,000	348,590,635.21
Miscellaneous revenues	101,438,830	158,030,305	102,454,931.73
Total revenues	\$8,903,773,830	\$7,284,040,305	\$5,810,097,596.01
2. Realization upon assets:			
Return of surplus funds from government corporations		360,500,000	105,738,806.75
Other	7,961,170	8,669,695	
Total receipts	\$8,971,735,000	\$7,653,210,000	\$5,924,836,402.76
Deduct net appropriation for Federal old-age and survivors insurance trust fund	696,300,000	640,280,000	537,711,733.00
Net receipts	\$8,275,435,000	\$7,012,930,000	\$5,387,124,669.76
II. Expenditures:			
1. Legislative, judicial and executive	\$41,328,200	\$38,546,168	\$36,704,687.17
2. Civil departments and agencies	956,028,287	905,154,202	954,248,927.17
3. General public works program	502,884,000	570,002,000	549,785,326.45
4. National defence	10,811,314,600	6,403,923,900	1,579,905,425.73
5. Veterans' pensions and benefits	564,570,000	500,110,000	550,092,391.13
6. Aids to agriculture:			
Gross expenditures	1,061,561,700	1,106,391,800	1,375,062,905.68
Return of surplus funds from government corporations		*315,000,000	
7. Aids to youth	362,590,000	309,325,000	377,893,084.34
8. Social security	462,520,000	430,279,900	383,615,113.02
9. Work relief:			
Gross expenditures	1,034,139,700	1,501,915,000	1,861,421,985.35
Return of surplus funds from government corporations		*24,500,000	
10. Refunds	89,006,300	70,008,000	91,070,763.72
11. Interest on the public debt	1,225,000,000	1,100,000,000	1,049,935,096.71
12. Transfers to trust accounts	214,585,262	216,215,000	207,853,400.00
13. Supplemental items—regular	100,000,000	150,000,000	
Total expenditures, excluding debt retirement	\$17,485,528,049	\$13,202,370,970	\$8,998,189,706.47
III. Net deficit	\$9,210,093,049	\$6,189,440,970	\$3,611,065,036.71
IV. Debt retirement	\$100,000,000	\$100,000,000	\$129,184,100.00
V. Gross deficit	\$9,310,093,049	\$6,289,440,970	\$3,740,249,136.71
VI. Means of financing deficit:			
1. Net decrease in working balance on general and special account			\$1,083,066,410.14
2. Borrowings:			
Replacing debt retirement	\$100,000,000	\$100,000,000	129,184,100.00
Increasing the public debt	9,210,093,049	6,189,440,970	2,527,998,626.57
Total, means of financing	\$9,310,093,049	\$6,289,440,970	\$3,740,249,136.71

*Excess of credits, deduct.

from the general expansion of economic activity. By 1939 total revenues had expanded to \$5,667,824,000, in contrast to the 1931 total of \$3,189,639,000. The net deficit, therefore, rose considerably less than expenditures; the deficit was \$481,000,000 for the fiscal year 1931 and \$3,542,000,000 for the fiscal year 1939. It was, perhaps, partially because of the new importance of the federal budget in the national economy, and the fact that it must reflect the economic and social policies of the president, that the bureau of the budget was transferred in 1939 from the treasury department to the executive office of the president. In 1940 economic experts were added to the staff of the budget bureau, suggesting that the problem of budget making was viewed as co-ordinate with the fiscal requirements of the economic situation.

As originally submitted by the president to congress, the federal budget for the fiscal year 1941 did not differ in its essentials from the actual receipts and expenditures of the fiscal year 1940, as shown in Table I. With the necessity for an enlarged national defence establishment demonstrated by the war in Europe, however, that proposed plan of government operations was drastically altered. A huge defence program was quickly outlined and passed by congress; before the end of 1940, \$22,371,405,000 in appropriations and contract authorizations were written into law. Two revenue acts were also passed which raised various tax rates and imposed an excess profits tax. As a result of these measures it was estimated in 1940 that total government expenditures in the fiscal year 1941 would be \$13,202,370,970, in contrast to actual outlays of \$8,998,189,706 for the fiscal year 1940. National defence expenditures were expected to rise to \$6,463,923,900 from \$1,579,905,425 over the same period, the total of all other items thus declining by almost \$700,000,000. Despite an increase in revenues estimated at almost \$1,500,000,000, the net deficit for 1941 was expected to be \$6,189,440,970, as against \$3,611,065,036 for 1940. The full magnitude of the defence effort toward which the nation was directing its energies, however, remained the keynote of the budget submitted by the president for the fiscal year 1942, shown in Table I. A national defence expenditure of \$10,811,314,600 was anticipated and this sum did not include whatever aid might be given to other democratic nations in their struggle against the totalitarian powers. This will be by far the largest peacetime expenditure for the armed forces in the history of the country and not far short of the 1914-18 World War expenditure at its peak in 1919.

Entirely as a result of this tremendous national defence outlay, the total expenditures of the government in 1940 were ex-

pected to rise to \$17,485,528,049. This figure, too, was the largest in U.S. peacetime history and approached the 1919 total of \$18,522,895,000. A reduction in the total of all other than defence expenditures was recommended by the president, in view of the improvement in general economic conditions already assured at the time. While the existence of certain fixed obligations of the government and commitments of congress necessitated the maintenance of various items of expenditures, a 15% curtailment in outlays for other activities was proposed. The reduction in the budget for these activities amounted to \$600,000,000, affecting primarily the Work Projects administration, non-defence public works and the agricultural program.

On the revenue side of the budget it was estimated that government receipts would total almost \$9,000,000,000 in the fiscal year 1942, an increase of \$3,000,000,000 over the revenue collected in the last year before the start of the defence program—the fiscal year 1940. Half this increase was to come from the new defence taxes enacted by congress, the other half from the rise in receipts which is always produced by an expansion of the national income. As the increase in expenditures would be considerably larger than the increase in revenues, the net deficit was calculated at \$9,210,093,049, a rise of more than \$3,000,000,000 over the previous fiscal year.

The president recommended that this deficit be financed primarily through borrowing because he feared that drastic and restrictive taxation would interfere with the full use of the na-

tion's productive resources. Furthermore, he pointed out that revenues from existing taxes would continue to rise in 1943 and partially reduce the deficit. However, it was suggested that a start be made in meeting a larger percentage of defence payments from current tax receipts by the imposition of additional tax measures based on the principle of ability to pay.

The budget of the United States as it was presented in 1940 did not differentiate the operating expenses of the federal government from its expenditures of an investment character. Hence, it is difficult to determine whether a deficit in any particular year represents an addition to the wealth of the nation or merely the financing of operating expenditures by debt creation. From 1931 to 1941, for example, the total expenditure on public works projects, such as roads, school buildings, airports, dams, post offices and administrative buildings amounted to \$8,800,000,000. Most, if not all, of these public works were of a durable character which have a life far beyond the years during which the expenditures were made. In this period a total of \$14,600,000,000 was spent on work relief and the Civilian Conservation corps and a good portion of these expenditures also resulted in the construction of projects of a durable type. In the federal budget expenditures for such durable projects are included in the determination of the deficit or surplus for the year.

This procedure differs from the treatment of capital outlays in the accounting statements of private business enterprises. A corporation deducts only depreciation on capital assets each year, rather than the total cost of the asset in the year when constructed or purchased. It has been suggested that the federal government adopt a similar procedure, including in its operating expenses for the year none of the addition to durable assets, but rather a derived figure equivalent to the amortization allowance on durable assets for the year. This procedure, known as the double budget, would involve setting up separate accounts for operating and for investment expenditures. When the expenditures for durable assets during the year were large, this procedure would have the effect of showing a smaller deficit than would be shown by 1940 budget methods. Over a long period of years, however, the total deficit would be the same.

This method of government accounting has been employed in Sweden, where the government was confronted with the financial problems arising from the undertaking of a heavy public works program. For details of the system employed by the government of Sweden and its possible application to the United States, see the articles in *Fortune Magazine* of Sept. 1938 and April 1939. Whether the double budget system can be successfully applied to the United States government financial accounts remains a question.

It has been suggested that a double budget be set up by separating all defence expenditures from other expenditures of the federal government. This type of double budget should not be confused with the one described above, for it is not based on the segregation of durable assets, but rather on the idea that the defence expenditures are of an emergency character and hence not to be confused with the regular expenditures. (See also NATIONAL DEBTS; NATIONAL INCOME; UNITED STATES.) (M. GT.)

Great Britain.—Two budgets for the financial year 1940-41 were presented during the summer of 1940. The estimates of revenue and expenditure will be found in the table, but the actual expenditure for the year depended on the course of the war and so both estimates must be regarded as provisional. As they stand, the April budget left a deficit of £1,432,000,000 and the July supplementary budget one of £1,106,000,000. The later figure shows the gap to be covered by borrowing.

Defence and war expenditure rose from £400,000,000 in 1938-39, the last complete prewar year, to £1,141,000,000 in 1939-40.

Table II.—British Budget, 1940

Total revenue	927.3	1,049.2	1,234.4	1,360.2

The latest estimate is £2,800,000,000 and the latest estimate for total expenditure is £3,467,000,000.

In his April budget Lord Simon, then chancellor of the exchequer, confirmed the raising of the standard rate of income tax from 7s. to 7s. 6d. in the £ and also the reductions in allowances for income tax—all of which had been announced in advance by him when he opened his Sept. 1939 war budget. Surtax rates were left unchanged, but the surtax exemption limit was reduced from £2,000 to £1,500 a year, to take effect in the financial year 1941-42. The beer duty was increased by 1d. a pint, the spirits duty by 1s. 9d. a bottle, and the tobacco duty by 3d. an ounce. The match duty was doubled. Heavy increases were also made in postal rates. The inland letter postage was increased from 1½d. to 2½d. and post cards were raised from 1d. to 2d. Increases were also made in telegraph and telephone charges. Finally the chancellor announced in general terms his intention to impose a purchase tax, together with the introduction of a new measure to limit company dividends to their prewar rates. During the summer the excess profits tax was raised from 60% to 100%. Thus all excess war profits accrued to the exchequer, and so the proposal to limit dividends became redundant and was dropped.

By July it was clear that the cost of the war had been underestimated, and so a new budget was introduced by Sir Kingsley Wood, who by then had succeeded Lord Simon at the exchequer. This budget raised the standard rate of income tax from 7s. 6d. to 8s. 6d., and the reduced rate on the first £165 of taxable income from 3s. 9d. to 5s. Surtax rates were raised by 9d. on incomes from £2,000 to £15,000 and by 6d. on higher incomes. Death duties on estates over £10,000 were increased by 10%. A further 1d. a pint on beer and 3d. an ounce on tobacco was imposed, together with higher duties on light wines.

Finally details of the new purchase tax were announced. This was to be 33½% on luxuries and 16½% on seminecessities. Food, drink, children's clothing, fuel, light and commodities already taxed were to be exempt. The tax was to be imposed as goods passed from the manufacturer or wholesaler to the retailer, and was estimated to add 24% or 12%, as the case may be, to the retail prices of commodities subject to it. The estimated yield was £40,000,000 in 1940-41, and £110,000,000 in a full year. The tax was to be included under excise duties.

The July budget increased prospective revenue for 1940-41 by £126,000,000, but taking the two budgets together, the total in-

crease in taxation was from actual receipts of £1,049,000,000 for 1939-40 to prospective receipts of £1,514,000,000 for 1941-42. This latter figure would doubtless be increased by higher taxation in the budget of 1941. (N. E. C.)

Building and Building Industry. The building industry of the United States continued its slow revival during the early months of 1940, increasing its pace after the middle of the year under the direct and indirect stimulus of the national defence program. The greatest increase was in nonresidential, chiefly industrial building. In the residential field the U.S. department of labour's preliminary estimate was 545,000 new urban dwelling units for 1940, which was better than the 1929 figure, though by no means equal to the need. The figure for 1939 was 465,000.

Table I.—Permit Valuation of Building Construction in Reporting U.S. Cities With a Population of 1,000 and over, First 11 Months of 1939 and 1940, by Class of Construction

Class of Construction	January-November, Inclusive		Percentage Change
	1940	1939	
All classes	\$2,258,852,079	\$1,920,244,909	+17.6
New residential	1,172,436,744	1,039,615,935	+12.8
New nonresidential . . .	773,131,977	559,092,714	+38.3
Additions, alterations and repairs	313,283,358	321,536,260	- 2.6

Table prepared by the Division of Construction and Employment of the U.S. Bureau of Labor Statistics.

The Federal Housing administration continued to be an important factor in the stimulation of private residential building through its insurance of mortgages. Preliminary estimates indicate that during 1940 the value of mortgage loans insured by it totalled \$1,023,000,000, of which \$592,000,000 represented new construction, \$254,000,000 repairs and modernization, and \$177,000,000 refinanced mortgages on existing homes. Approximately 180,000 new units were started under FHA inspection during the year.

The Federal Home Loan Bank system reported that during 1940 \$360,000,000 was lent by its member institutions for the construction of new homes. The year showed a wholesome tendency to cater to the unsatisfied demand for low-priced houses, which, however, sometimes had to encounter the organized hostility of neighbouring property owners. Single-family units continued to be the predominant type and, except as provided by public agencies, were almost exclusively for sale. FHA insurance for large-scale rental projects in the middle price range produced only 4,000 family units during the year, and even those were nearly all apartments.

Table II.—Number of Families Provided for in New Residential Construction in 257 Identical Cities, 1921 to 1940

Year	Families Provided for	Year	Families Provided for	Year	Families Provided for
1921	224,545	1928	388,678	1935	55,490
1922	377,305	1929	244,394	1936	114,789
1923	453,673	1930	125,315	1937	117,323
1924	442,096	1931	98,158	1938	157,104
1925	491,032	1932	27,380	1939	203,625
1926	462,208	1933	25,885	1940*	228,250
1927	406,095	1934	20,952		

*Preliminary figure.

Table prepared by the Division of Construction and Employment of the U.S. Bureau of Labor Statistics.

The reluctance of private enterprise to build low or medium rental housing seemed likely to produce one of the most acute problems in the national defence program. For it appeared fairly obvious that if the risk of loss because of the temporary character of defence industries is too great for business men to assume,

government can hardly permit the unloading of that risk on the shoulders of individual workers through pressure-induced home purchase. Rise in building costs was not spectacular in 1940, but the trend was upward. Responsible leaders of the industry warned against large price increases and against "boom psychology."

Great Britain.—During 1940 the building industry in Great Britain had to contend with exceptional difficulties owing to the fluctuations in the war situation.

Increased pressure was placed upon its resources in the latter part of June, arising from the collapse of France and the necessity for the immediate provision of vital coastal defence works, in addition to an ever increasing number of buildings of all kinds for military accommodation. Intensive bombing attacks increased this pressure by creating a demand for additional air raid precautions works and the repair of damaged buildings. Both military and civil defence works were, for practical purposes, localized throughout the country.

The new control of private building enterprise order, which was shortly to come into operation, should not have seriously affected the industry, as there had been an almost complete cessation of private building.

The effect of this widespread public building program was more than sufficient to absorb most of the available labour and material resources of the building industries. By the closing months of 1940 the position had been reached when the relationship between the demands on them, and their resources, had to be planned and made infinitely more orderly if the economic best from this great group of industries was to be obtained. The long-anticipated ministry of building had arrived and, although its personnel and structure were at this time unknown, it could be sure in advance of the fullest co-operation of the building industries in the co-ordinated utilization of all their resources. Expansion of the export trade to its utmost capacity was held to be vital as a means of reducing the adverse trade balance. With this object in view an export group for the constructional industries was formed to develop overseas trade in fittings and components. Manufacturers and contractors concerned with this activity were most likely to succeed by a co-ordinated sales effort through co-operative selling groups. Bulgaria. A kingdom in the Balkans, comprised in Jan. 1940, an area of 39,814 sq.mi., with a population of about 6,370,000. As a result of the treaty of Crayova on Sept. 7, 1940, Bulgaria acquired from Rumania the Southern Dobruja, and added thus c. 2,900 sq.mi., with a population of 350,000, to her territory. After this success, Bulgaria continued to demand the cession of parts of Macedonia from Yugoslavia, and access to the Aegean sea with the port of Dédeagatch from Greece, but at the end of 1940 these claims remained unfulfilled.

In its governmental set-up, Bulgaria continued the regime established by the royal *coup d'état* of May 19, 1934, by which parliamentary rule was reduced to a shadow and the real power passed into the hands of the king, Boris III, who exercised his authority through cabinets of his own choice. All political parties were abolished, and the elections were held under strict governmental control. The population, the large majority of whom are peasants of the lower income groups with very definite demo-

cratic leanings and with a strong sympathy for the great Slav "brother," Russia, resented the dictatorship, especially in view of the fact that the king, himself of German descent and married to an Italian princess, and the court favoured the axis powers. At the outbreak of the European war in 1939 Bulgaria had declared a policy of strict neutrality, but with the growing successes of the axis Bulgaria inclined more and more towards a pro-German policy, through which she also hoped to satisfy her territorial aspirations. Economically Bulgaria soon passed entirely under German control. Although she accepted many aspects of fascist policy, including the introduction of the first anti-Semitic legislation in Bulgaria's history, nevertheless she did not join the axis alliance officially. King Boris visited the German chancellor on Nov. 17, but the expectation that Bulgaria would follow Hungary, Rumania and Slovakia in signing the Berlin-Rome-Tokyo pact was not by Jan. 1, 1941 fulfilled.

The energetic resistance shown by the Greeks, the pressure exercised by Turkey's determined stand, and Great Britain's success against the fascist forces in Egypt, may have been responsible for the continuation of Bulgaria's official neutrality. It was rumoured that Germany demanded the passage of German troops through Bulgaria against Greece and Turkey, but that the demand was refused in 1940.

In view of the strained internal situation, King Boris dissolved the parliament and new elections were held in Jan. 1940. Hopes that the new parliament would reflect less the oppositional attitude of the people were not realized. The government, of course, received the majority of the votes, but this majority was much smaller than expected. Under these circumstances, the Prime Minister, George Kiusseivanoff, who had ruled the country as the king's confidant for four years, resigned and the Minister of Education, Bogdan Philoff, an archaeologist and scholar of renown, formed the new government with Ivan Popoff as foreign minister and Ivan Bagrianoff, a declared friend of fascism, as minister of agriculture. The new parliament was opened on Feb. 24. The only important piece of legislation passed during the spring was a bill re-introducing compulsory military service for all men between 17 and 65, thus abolishing the disarmament clause of the peace treaty of Neuilly.

The re-acquisition of the Southern Dobruja which Bulgaria had ceded to Rumania in the peace treaty of Bucharest in 1913 at the end of the second Balkan War was greeted by all Bulgarians with enthusiasm. The weakening of Rumania under heavy pressure from Germany, the Soviet Union and Hungary, gave Bulgaria the opportunity to re-annex the land without any actual warfare. Southern Dobruja, with a predominantly Bulgarian population, represents a relatively fertile land between the lower Danube and the Black sea; the population includes strong Turkish and Rumanian minorities, the latter to be exchanged for the Bulgarian minority remaining in the Northern Dobruja region. The important Bulgarian port of Varna on the Black sea receives its natural hinterland by the Bulgarianization of the Southern Dobruja, which was occupied on Sept. 20 by Bulgarian troops. Bulgaria voiced her intention of entering into friendly relations with Rumania after the fulfillment of her territorial claims, but her relations with Greece remain strained. Relations with Turkey and with Yugoslavia seemed to be improving at the end of 1940, although a certain distrust on both sides continued. On Dec. 29 the parliament expressed support of the government's foreign policy which the foreign minister defined as aimed at keeping the country out of war while defending the nation's "vital interests." In view of the growing sympathies for Russia as against Germany with the Bulgarian peasant masses, the majority party decided to stage an intensive campaign of speeches by cabinet ministers all over the country to explain its foreign policy to the people. (H. Ko.)

Bunau-Varilla, Philippe (1859-1940), French engineer, was born in Paris, July 25. He was graduated from the École Polytechnique and was at once employed by the government as an engineer of bridges and roads. In 1884 Count de Lesseps hired him as an assistant engineer in the Panama Canal company and made him chief engineer a year later. When the French company stopped work in 1889 Bunau-Varilla devoted himself to interesting the United States in the completion of the canal, and he was active in the negotiations which led to the sale of the French rights to the United States for \$40,000,000. He was later interested in railroads in Africa and Spain. During the World War of 1914-18 he served as a major of engineers in the French army. He died in Paris, May 18.

Bundy, Omar (1861-1940), U.S. major general, was born in New Castle, Ind., June 17, and was graduated from the United States Military academy in 1883. He continued his studies at the Infantry and Cavalry school and the War college. He began active service with the 2nd infantry regiment and fought in the Indian Wars, the Spanish-American War and in the Philippines. He was cited for gallantry in action both in Cuba and in the Philippines. When the United States entered the World War in 1917 he was in command of a regiment on the Mexican border. He sailed for France in June 1917, in command of the 1st brigade of the 1st division, was transferred to the command of the 2nd division and was active in stopping the German advance at the battle of Château-Thierry. General Pershing sent him to the United States in Oct. 1918 to supervise the training of American troops at Camp Lee, Va. Before he was sent home he had been promoted to the command of the 6th army corps. He died in Washington, Jan. 21.

Bureau of Standards, National: *see* STANDARDS, NATIONAL BUREAU OF.

Burma. A British province lying on the eastern side of the Bay of Bengal, between India and Siam. Area 261,610 sq.mi.; pop. (est. 1940) 16,000,000. Chief towns: Rangoon (cap. 460,000), Mandalay (150,000), Moulmein (70,000). Governor: the Rt. Hon. Sir A. D. Cochrane; prime minister: the Hon. U. Saw; languages: Burmese and English; religion: Buddhist (85%).

History.—For the greater part of 1940, Burma enjoyed a period of relative stability. After the defeat of U. Pu's government in September, U. Saw led the new government. Burma gave the required year's notice for the termination of the Indo-Burman (Trade Regulation) Order in Council of 1937. It was expected that a new trade agreement would be negotiated by the two countries to take effect from April 1, 1941. The war necessitated the introduction of price control in order to prevent profiteering and an undue rise in the cost of living.

In order to conserve currency, imports were regulated under a system of licences. Export restrictions were imposed to prevent supplies from reaching enemy countries directly or indirectly. The British government made arrangements to buy up Burma's supplies of essential raw materials including minerals. Priority of shipping space was given to other essential products like teak, rice and beans. As more than half of Burma's import and export trade is with India and most of the rest is with other British empire countries, Burma's economic structure was not unduly disturbed in consequence of the war. Better prices were obtained for some of her export products and prices were stable for others so that there was some economic benefit.

Through the appointment of joint secretaries, the defence and the commerce departments worked in close co-operation to

THE BURMA ROAD, main route for war supplies to China, was closed by the British July 18, 1940, in an agreement with Japan, but was reopened three months later

facilitate war work. The governor's appointment of the Hon. U. Maung Gye as the first Burman counsellor in addition to his two British counsellors marked a further step in constitutional progress. During the rainy season, the much discussed Burma-China road was closed but was reopened in October.

Education.—In 1939: total number of schools 27,059; scholars 824,432; primary schools 5,432; scholars 363,089; middle 1,015; scholars 138,681; high 376; scholars 88,783; special 1,214; scholars 18,292; unrecognized institutions 19,020; scholars 213,294; university, Rangoon, 2,210 students; arts college, Mandalay, 83 students.

Finance.—Revenue (est. 1940-41) Rs.16,03,06,000; expenditure (est. 1940-41) Rs. 16,46,60,000; public debt (net debt on March 31, 1939) Rs. 24,13,31,000; exchange rate: rupee (Rs. 1) = 1s. 6d.

Trade and Communications.—Overseas trade (merchandise) (April-March 1939-40): imports Rs. 25,16,00,000; exports Rs. 54,05,00,000; re-exports Rs. 98,00,000. Communications 1939: roads, suitable for motor traffic, all-weather 6,263mi.; seasonal 6,280mi.; railways, open to traffic 2,060mi.; inland waterways (approx.) 1,300 miles.

Agriculture, Manufactures, Mineral Production.—Production (est. 1939-40): rice 5,175,930 long tons; petroleum (crude) (1938) 263,823,265gal.; ground nuts 190,000 long tons; sesamum 52,000 long tons of seed; tobacco (1939) 90,468,000lb.; silver (1938) 5,920,000 troy ounces. (For further statistics see COTTON; LEAD; MINERAL AND METAL PRICES AND PRODUCTION; TIN; TUNGSTEN. See also CHINESE-JAPANESE WAR.) (H. L.)

Buses, Motor: see ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; MOTOR VEHICLES.

Butler, Smedley Darlington (1881-1940), U.S. marine corps officer, was born in West Chester, Pa., July 30. He was educated at the Haverford school. When the war with Spain began in 1898 he obtained appointment as a lieutenant of marines through the influence of his father, a member of congress. He was promoted through various grades until he reached the rank of major general in 1929. He retired Oct. 1, 1931. He had a record for distinguished service in various parts of the world and received two congressional medals of honour. In 1924 he obtained a leave of absence and served as director of public safety in Philadelphia for not quite two years. He died in the Naval hospital in Philadelphia, June 21.

Butte, George Charles (1877-1940), professor of law in the University of Texas, was born in San Francisco, Calif., May 9. He was graduated from the University of Texas in 1903 and after another year of study he began to practise in Muskogee, Okla. In 1911 he went to Europe and studied at the universities of Berlin and Heidelberg and at the École de Droit in Paris. On his return to the U.S. in 1914, he was engaged as professor of law at Texas university. During the last year of the World War of 1914-18 he was chief of the foreign intelligence department of the United States general staff. He was defeated as the Republican candidate for governor of Texas in 1924 and was appointed in 1925 as attorney-general of Puerto Rico, serving until 1928. He then became successively an assistant to the United States attorney-general, vice-governor of the Philippines, and associate justice of the supreme court of the islands. He died in Mexico City, Jan. 18.

Butter. Output of creamery butter in the U.S. in 1940 was at a rate slightly higher than that of 1938 when 1,786,000,000lb. were produced, a new high record at that time. For the first ten months of 1940 creamery butter output in the U.S. was 1,567,790,000lb. compared to 1,533,705,000lb. in the same period in 1939 and about 1% higher than the first ten months of the record year 1938. Experts in the butter trade estimated that full-year production in 1940 exceeded that of 1938 by approximately 1%, establishing a new record. Production in 1939 was reported by the U.S. department of agriculture as 1,761,775,000lb. June 1940 established a new high in monthly production of creamery butter, 203,800,000lb. as against 202,540,000lb. in 1938 and 199,560,000lb. in 1939. June is the month of heaviest butter production. Market conditions for butter in 1940 were entirely different from those in the preceding peak year, 1938. In 1940 increased employment and industrial activity provided a consumer demand and buying power that supported the market at substantially higher prices. Comparatively little butter was distributed for relief purposes. In 1938 the Dairy Products Marketing association borrowed approximately \$33,000,000 from the federal government and bought about 114,000,000lb. of butter, virtually all of which was distributed through relief channels. In the first half of 1940 the Federal Surplus Commodities corporation bought comparatively small amounts of butter in supporting the market; about 1,500,000lb. in March, 5,000,000lb. in April, 480,000lb. in May and subsequently inconsequential scattered purchases of a few hundred tubs. The Dairy Products Marketing association, which is a marketing organization for dairy co-operatives, was authorized by the department of agriculture to buy up to 25,000,-

oolb. of butter in the period between May 1, 1940 and April 30, 1941, but in 1940 the DPMA took practically no action as the steady consumer demand maintained prices, and butter consumption reached a new high record. On Nov. 1, 1940, butter in cold storage amounted to 104,673,000lb. compared to 128,111,000lb. on the same date in 1939, while stocks in the hands of the Federal Surplus Marketing administration (successor to the Surplus Commodities corporation) and state relief agencies were only 73,000lb., an inconsequential amount. U.S. butter exports the first nine months in 1940 were 2,113,895lb. and imports 910,906lb. compared to 1,539,193lb. exports and 781,417 imports in the same period in 1939. In the futures market during 1940 butter prices advanced steadily, November butter advancing from 28.80 cents per lb. in June to 33.50 cents Nov. 30 on the Chicago Mercantile exchange. Byrne, Edward J. (1872-1940), Catholic archbishop of Dublin. He was born in that city, was educated at Belvedere college and the Irish college in Rome and was ordained a priest in 1895. He served as vice-rector of the Irish college from 1901 to 1904, when he was made curate of the pro-cathedral in Dublin, holding that post until 1920. A year later he was made archbishop and primate of Ireland. In 1932 he was made a Knight of the Grand Cross of the Sovereign Order of Malta. He died in Dublin, Feb. 9.

Cabinet Members. The following members of President Roosevelt's cabinet held office on Jan. 1, 1941:

Post	Name	State
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Henry L. Stimson	New York
Attorney-General	Robert H. Jackson	New York
Postmaster General	Frank C. Walker	Pennsylvania
Secretary of the Navy	Frank Knox	Illinois
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Claude R. Wickard	Indiana
Secretary of Commerce	Jesse H. Jones	Texas
Secretary of Labor	Frances Perkins	New York

Great Britain.—Immediately on the declaration of war in Sept. 1939 a war cabinet was constituted; at the close of 1940 the war cabinet was composed as follows:

Post	Name	Party
Prime Minister and First Lord of the Treasury	Winston Churchill	Conservative
Lord Privy Seal	C. R. Attlee	Labour
Lord President of the Council	Sir John Anderson	Conservative
Secretary of State for Foreign Affairs	Anthony Eden	Conservative
Minister without Portfolio	Arthur Greenwood	Labour
Minister for Aircraft Production	Lord Beaverbrook	Conservative
Chancellor of the Exchequer	Sir Kingsley Wood	Conservative
Minister of Labour and National Service	Ernest Bevin	Labour

For other ministers and members of the government see GOVERNMENT DEPARTMENTS AND BUREAUS.

Cadmium. World production of cadmium in 1940 approximated 4,500 metric tons, of which the United States supplied about half, followed by Mexico, Germany, Canada, Belgium, Australia and several minor producers. The outbreak of war in Europe drove the price of stick cadmium from 50 cents per pound in Aug. 1939 to 80 cents in Jan. 1940, at which point it stood for the remainder of the year; platers' anodes were consistently 5 cents higher. Consumption of cadmium in the

United States rose to a new high level in 1939, at 5,922,000lb., more than double that of 1938, and sales exceeded production by 14%. (G. A. Ro.)

Caldecott Medal: see AMERICAN LIBRARY ASSOCIATION; CHILDREN'S BOOKS.

Calendar of Events, 1940: see pages 1-16.

California, Pacific coast state of the United States, and thirty-first state to enter the Union (Sept. 9, 1850), is popularly known as the "Golden State." The area is 155,652 sq.mi., and the population (U.S. census, 1940) 6,907,387, an increase of 1,230,136 (more than any other state) over the 1930 figure (5,677,251). The gain for the decade was 21.7%, as compared with 65.7% for 1920-30, and entitled the state to increase its congressional delegation from 20 to 23. Rural population gained 32.2% and urban only 17.8%, reversing the trend during 1920-30, when the increases were 78.8% for urban and 37.9% for rural. Total city population was 4,902,265 (71%) and rural 2,005,122. Chief cities (with increase over 1930 in parentheses) were: Los Angeles, 1,504,277 (21.5%); San Francisco, 634,536 (less than 1%); Oakland 302,163 (6.4%); San Diego, 203,341 (37.4%); Long Beach, 164,271 (15.7%); Sacramento (the capital), 105,958 (13%); Berkeley, 85,547 (4.2%); Glendale, 82,582 (31.6%); Pasadena, 81,864 (7.6%). Fifty other cities exceeded 10,000. In 1930 there were 97,456 Japanese, 81,048 Negroes, 37,361 Chinese and 1,073,946 foreign born.

History.—The year 1940 was marked by continued political dissension between the legislature and Governor Culbert L. Olson (liberal Dem.), and by widespread economic improvement under the stimulus of the national defence program. The legislature held its regular biennial meeting in 1939, but convened for five special sessions in 1940, largely to consider relief needs, for which it had made inadequate provision in the 1939-41 budget. Conservative Democrats in the assembly joined with Republicans to form an "economy bloc," which elected Gordon Garland, anti-Olson Democrat, as speaker and dominated capital politics throughout the year. Except for relief appropriations, the legislature transacted little important business. A bill excluding Communist party candidates from the state ballot was adopted almost unanimously and endorsed by Governor Olson, but on most other matters the governor and legislature sharply disagreed.

Three state-wide elections were held in 1940. The third-term issue split Democratic ranks in the presidential primaries, with the Olson-sponsored Roosevelt delegation winning decisively over three other groups, including one headed by Lieutenant Governor Ellis E. Patterson, between whom and the governor there was a spirited rivalry most of the year. In the November general elections the state cast a record vote of 3,300,410, 81% of its 4,052,395 registration. Complete statistics for the California presidential election were as follows: Roosevelt, 1,877,618; Willkie, 1,351,419; Thomas, 16,506; Browder, 13,586; Babson, 9,400. The figures for the U.S. senatorial election were: Hiram Johnson, 2,238,899; Fred Dyster (Prohibition), 366,044; Anita Whitney (Communist), 97,478; John Anson Ford (write-in), 7,415; scattering, 4,024. Eleven Democrats and nine Republicans were elected to congress, and the bi-partisan "economy bloc" confirmed its control of the state legislature, despite the governor's active campaign against some of its members. The outstanding event in municipal elections was the defeat of Buron Fitts, district attorney in Los Angeles for 12 years, by John F. Dockweiler, former Democratic congressman.

Relations between capital and labour were generally harmonious with shipping and agriculture remaining relatively free from the violent disturbances of previous years. Public works aided

greatly in improving labour's position. Nearly \$30,000,000 in federal funds was allocated for improvement of facilities at the Mare island naval yard and for construction of an air base at Alameda and a naval supply depot at Oakland, while considerable sums were likewise allotted for other defence bases throughout the state. Employment reached a peak of 5,000 men on the \$228,000,000 central valley reclamation and water-power project, which embraces one-third of the state's area and two-thirds of its agricultural lands; by June 1940, \$43,000,000 had been expended on this undertaking, and \$30,000,000 more was available for the fiscal year ending June 1941.

Education.—The University of California continued to be ranked with Harvard and Columbia as one of the country's leading universities. With a physical plant valued at over \$55,000,000, gross assets exceeding \$90,000,000, and an operating budget of \$13,500,000 for 1940-41 (63% received from the state), the university led the nation in full-time enrolment (28,851 in the fall semester 1940). The well-developed public school system, buttressing the university, was allotted nearly \$77,000,000 by the state for 1939-41.

Charities and Correction.—For the 1939-41 biennium the state appropriated some \$75,000,000 for unemployment relief, for which the need mounted steadily until early 1940, largely due to the influx of migratory workers, of whom from 300,000 to 400,000 entered the state during 1933-40. Improved business conditions in the middle and latter part of 1940 sharply reduced relief rolls, with the state relief administration case-load dropping from 111,306 in February to 37,907 in November, and WPA cases from 90,911 to 78,592. During the fiscal year ending June 30, 1940, nearly \$43,000,000 in state and federal funds was disbursed to the blind, the aged, and needy children, while the counties paid an additional \$57,000,000. California led the nation in payments to the aged, with an average of \$37.90 monthly per recipient, as compared with the national average of \$20.09. In October, 148,175 aged, 37,554 children and 7,318 blind received categorical aids. State benevolent, correctional and penal institutions were allotted \$25,000,000 for 1939-41 (nearly 25% of the sum provided for government operations); inmates averaged 37,963, a 41% increase over 1930.

Finance and Banking.—The budget for the 1939-41 biennium was \$554,415,806 (exclusive of federal subventions), highest in the state's history. On June 30, 1940 the cumulative general fund cash deficiency reached a record high of \$82,110,559, including a \$44,746,926 carry-over from previous biennia. Thereafter the deficit rapidly diminished, as business expansion and defence spending increased revenues and combined with military conscription to reduce the need for unemployment relief. On Nov. 30 the deficit was \$68,600,538 (still \$12,962,000 more than in Nov. 1939) and was expected to decline to \$40,000,000 by June 1941. Tax receipts for the fiscal year ending June 30 were \$328,725,411 (about \$18,000,000 over 1938-39 and \$81,000,000 over 1937-38). State bonded debt for the fiscal year was \$172,000,000, and total bonds outstanding were \$933,000,000. On June 29 there were 227 banks (128 state, 99 national), with loans of \$1,862,112,000 (compared with \$1,789,889,000 in 1939), investments of \$1,806,303,000 (compared with \$1,733,241,000 in 1939), and deposits of \$4,110,088,000 (compared with \$3,984,342,000 in 1939).

Agriculture, Manufactures.—Substantial gains were made in nearly all branches of economy during 1940, continuing a trend begun in late 1939. The total production value in basic industries rose 14.3% to approximately \$2,340,000,000, as compared with \$2,047,000,000 for 1939; \$1,927,000,000 for 1938; and \$2,424,000,000 for the record year of 1929. Manufacturing (value added) contributed 49%, agriculture 28%, mining 19%, lumbering 3% and fishing 1%. (In 1900 agriculture accounted for 47.1%

and manufacturing 32.7%; manufacturing became the leading industry in 1919.) Gross farm income was estimated at \$657,000,000, an 11% gain over 1939. Gold production, in which the state maintained its top rank, declined for the first time since 1930; the yield was 1,408,700 fine ounces (valued at \$49,304,500), 2% less than in 1939. The European war spurred copper, lead and zinc mining, and, although adversely affecting foreign trade caused a general industrial expansion through the awarding in the state of over \$1,000,000,000 in federal defence contracts. Spectacular progress was made in San Francisco shipbuilding, in which employment increased 261% and pay rolls 349% over 1939, and in the southern California aircraft industry, in which employment rose 101% and pay rolls 124%. In December, total industrial employment and pay rolls were 23% and 27% higher, respectively, than at the end of 1939. Imports were \$153,015,645 for the first ten months (compared with \$107,275,607 in the same period of 1939); exports aggregated \$210,260,211 (compared with \$230,970,639 in 1939).

California, University of. During the year 1940 the University of California was honoured by the award of the 1939 Nobel prize in physics to a member of its staff, Dr. Ernest Orlando Lawrence. The award, as far as known the first to be received by a member of the faculty of a state university, was made at a ceremony on Feb. 29, 1940, with the Swedish consul in San Francisco representing the Nobel prize committee. Dr. Lawrence's work, involving the development of the "cyclotron" and research on nuclear physics, was further recognized by gifts totalling \$1,250,000 from the Rockefeller Foundation and other agencies, to go toward the cost of constructing a larger cyclotron which will produce energies of the order of 100,000,000 electron-volts. A site for the new instrument was chosen on the crest of a hill overlooking the Berkeley campus and construction was started in the fall of 1940.

Two additional members of the university faculty, Dr. Karl F. Meyer and Dr. Wendell Latimer, were elected to the National Academy of Sciences, bringing the university's representation in the academy to 23 members.

Among various changes instituted at the university may be cited the following: extension of the program of student guidance and counselling; liberalizing of entrance requirements and stiffening of requirements for continued residence; the establishing of a graduate department of social welfare; establishing of a department of journalism; the creation on the Los Angeles campus of a college of applied arts; the establishing of a program of research and public service in the field of ornamental horticulture under the college of agriculture.

Enrolment on the seven campuses making up the university increased from 27,551 in 1939 to 28,851 in 1940. Summer sessions enrolled an additional 8,153. Instructors, curators and research workers totalled 2,388. An additional 744 instructors and administrators were engaged by the extension division. Gifts for the year totalled \$1,321,944.86. The number of volumes in the libraries was 1,700,000. (R. G. S.)

Callahan, Patrick Henry (1866-1940), U.S. industrialist, was born in Cleveland, Ohio, Oct. 15. He received his education in St. John's High school and the Spencerian Business college in Cleveland. He began his business career with the Glidden Varnish company of that city, remaining with it until 1892 when he became connected with the Louisville Varnish company, rising to its presidency. He intro-

duced a system of profit-sharing for his employees and was active in various societies favouring international peace, the prohibition of the sale of intoxicants, the regulation of child labour, and religious toleration. Pope Pius XI made him a Knight of St. Gregory. He served as a director of the Reconstruction Finance corporation and the National Labor Relations board. He died in Louisville, Feb. 4.

Cambridge, University of. In the Michaelmas term 1939 there were 4,353 men students and 465 women *in statu pupillari*, as compared with 5,491 and 513 in the previous year. In the Lent term 1940 the number of men had dropped to 4,218. There were also 1,649 evacuated students from London colleges and medical schools. The number of masters of arts and seniors was 1,374 men, 152 women and 235 evacuated staff. The council decided that four terms would be allowed towards degrees to students on war service. Under the university emergency provision act of 1939 power was granted to suspend vacant offices, scholarships, etc. The university lost by death Professor Whitney (ecclesiastical history), Professor Sir W. J. Pope (chemistry), Dr. A. C. Haddon (the pioneer of scientific anthropology and leader of the Cambridge expedition to Torres straits) and Sir J. Withers (the senior Burgess). During the year three heads of colleges died: Peterhouse, H. W. V. Temperley (professor of modern history); Trinity, Sir J. J. Thomson (the pioneer of atomic physics); Jesus, A. Gray (historian of the town). The windows of King's college chapel were removed to a place of safety. (C. Fo.)

Campbell, Beatrice Stella (MRS. PATRICK CAMPBELL) (1865-1940), English actress, was born in London, Feb. 9, the daughter of John Tanner. She received a musical education and in 1884 married Captain Patrick Campbell, who went to South Africa two years later and was killed in the Boer War. She played with an amateur dramatic company in London in 1886 and made her professional debut on the stage in Liverpool in 1888. She won sufficient success to justify casting her for the leading part in *The Second Mrs. Tanqueray* in 1893. Her performance was so brilliant that she was in constant demand thereafter, playing with Beerbohm Tree, John Hare and Forbes-Robertson, appearing as Juliet to Forbes-Robertson's Romeo. She made her first appearance in the United States in 1901. In 1904 she acted with Sarah Bernhardt in *Pelleas and Melisande*. At the height of her career Kipling referred to her in a poem as "a rag, a bone and a hank of hair." She published her memoirs in 1922, including letters to her from George Bernard Shaw which created a sensation. At the age of 65 she made her debut as a motion picture actress. Her last appearance on the stage was in 1938. She died in Pau, France, April 9.

Camp Fire Girls. The Camp Fire Girls' program of recreational, educational and character developing activities for girls (formulated in 1910-11) was re-examined during 1940 in relation to world conditions and the preparation of the United States for total defence. Believing that the training of youth is as important to our country's welfare as the drilling of soldiers and the manufacture of tanks and aeroplanes, the following resolution was passed by the national board of directors at their meeting in May 1940:

We, the National Board of Directors of the Camp Fire Girls, do therefore resolve:

To stress the American ideals inherent in the Camp Fire Girls' program—to help girls understand the privileges and responsibilities of Democracy—to give them actual experience in the Democratic way;

To keep alive those things that are civilized in our society—to stimulate, through appreciation and participation, creative art and creative thinking, believing them to be life-renewing and continuing through and beyond the present destruction;

To give generously through the American Red Cross and other agencies, realizing always that while we do what we can to assuage the suffering of the present, the task and privilege of youth is to prevent suffering and injustice in the future;

To hold to the faith that is ours in man and God.

This was further supplemented at the meeting of the national council held in New York in September by a discussion under the leadership of Mary Beard, historian and economist, when it was agreed to avoid war hysteria and to concentrate on training in democracy, health, creative activities, service and consumer education (wise buying and use of food, clothing and home furnishings).

Camp Fire Girls in Great Britain, Holland and China have been highly commended for the service they have given particularly in the care of refugees and war sufferers.

At the meeting of the national council the following officers were elected: president, Mrs. Elbert Williams; treasurer, Ward Johnson; secretary and national executive, Lester F. Scott. Her Highness Princess Marie Louise is patroness of the British Camp Fire Girls and Lady (Walter) Hearn is president. (C. F. Lo.)

Canada. Canada, self-governing British dominion of North America; capital, Ottawa; governor general, the Earl of Athlone; prime minister, the Rt. Hon. William Lyon Mackenzie King; area, 3,729,665 sq.mi.; pop. (census of 1931) 10,376,786, estimated (Jan. 1, 1941) 11,484,000.

History.—Almost at the opening of 1940 the tragic death of Lord Tweedsmuir (previously the distinguished scholar and author, John Buchan) left vacant the office of governor general. On the advice of the Canadian ministry, the crown appointed the Earl of Athlone, a cousin of King George, a veteran soldier and formerly governor general of the Union of South Africa (1923-31). Lord Athlone arrived in Canada (with his wife, Princess Alice) in June and was installed in office on June 21.

Government and Politics.—The outstanding political event of 1940 was the dominion general election of March 26. The Liberal

OTTAWA AIR STATION during an inspection in the spring of 1940 by Canadian Air Marshal Bishop

party, in power under Mr. King since Oct. 23, 1935, was returned with an increased majority. The election turned almost solely on war issues. The National Conservative party, led by Dr. R. J. Manion, attacked the government by ascribing lethargy and ineffectiveness to their war effort. On the other hand, the Conservatives were handicapped by the memory of the overseas conscription of their government in the war of 1914-18, as compared with the Liberal policy of conscription for home defence only.

A number of cabinet changes were made during the year. On April 11, C. D. Howe was named minister of munitions and supply. After the general election, James Angus MacKinnon, previously a minister without portfolio, was made minister of trade and commerce, and Pierre François Casgrain was made secretary of state. After presenting the budget, the minister of finance, Col. James Ralston, assumed in the new cabinet the portfolio of national defence, left vacant by the untimely death of Norman Rogers. J. L. Ilesley became the new minister of finance. The portfolio of the minister of national defence was lightened by the adjunct appointments of a minister of defence for air, C. G. Power, and a minister of naval defence, Angus L. Macdonald.

In provincial politics a leading event was the general election held in Alberta on March 21. The social credit government of William Aberhart, which had come into power in Sept. 1935, was again re-elected, but with a majority reduced to 36 of the 57 seats. In New Brunswick, the vacancy caused by the resignation of the premier, A. A. Dysart, was filled by J. K. McKee, elected by acclamation. In Quebec, an act was passed in April granting the provincial franchise to women and permitting their candidacy in provincial elections.

A principal event in municipal history was the adoption of the new form of government of the city of Montreal at the elections of Dec. 9. Adhémar Reynault was elected mayor; Camillien Houde interned and disqualified. The new city council consisted of 99 unpaid members; 33 appointed by civic, commercial and educational bodies; 66 by a vote of the property holders, six from each of 11 districts, of whom three must be property owners. Very little interest was taken in the election. Little more than a quarter of the voters went to the polls. One property seat went begging.

Of changes in the diplomatic service may be mentioned the appointment of J. H. R. Cromwell as United States minister at Ottawa and his resignation in May, due to his candidacy for the United States senate, and the subsequent appointment of J. P. Moffat. Dr. Henry Laureys of Montreal was appointed high commissioner to South Africa.

Parliament met on May 16. At a Conservative caucus, Dr. Manion had withdrawn from his leadership and R. B. Hanson took his place as leader of the opposition in the new parliament. The most important pieces of legislation adopted were the National Registration act and the National Resources Mobilization act. The former of these called for compulsory registration of all Canadian residents 16 years of age or over, Aug. 19, 20, 21, 1940.

For a declared refusal to obey the act after it was passed and for publicly urging others to refuse, Camillien Houde, the mayor of Montreal, was sent to a concentration camp under authority of the War Measures act. A later order disqualified all persons interned from being candidates in any election while in internment. The National Resources Mobilization act authorized the government to conscript all human and material resources for the defence of Canada. It instituted compulsory training, for one month, for all able-bodied men between 21 and 45 years of age as called up.

Public Finance.—The second war budget of the dominion was

presented by the minister of finance on June 24, 1940, dealing with the fiscal year then running (March 31, 1940–March 31, 1941). Provisions had to be made for an estimated expenditure of \$448,000,000, as apart from the war expenditure, and for war expenditure of \$700,000,000 already authorized, and for additional war expenditure of \$150,000,000 to \$200,000,000. To meet this there was available anticipated tax revenue from present taxes of about \$650,000,000, and from new taxes of about \$150,000,000. This would leave a shortage of anticipated income to cover anticipated expenditure of nearly \$700,000,000, which must be met by loans.

The first dominion war loan of \$200,000,000 (3½% bonds due 1952) was accordingly opened Jan. 15, 1940, and was heavily oversubscribed. The second dominion war loan was offered on Sept. 6 (\$300,000,000, 3% bonds due 1952) and was fully subscribed by Sept. 21. Both these loans were raised entirely in Canada, outside subscription being illegal. The returns showed that the great bulk of the money came from actual savings and not by advance borrowing on the part of subscribers. Stock market returns as tabulated in December showed the credit of the dominion as on a 3½% basis.

A supplementary budget (so-called "baby budget") was brought down by Mr. Ilesley on Dec. 2. War purchases had greatly strained in 1940 the exchange relations of Canada with the United States. The adverse balance against Canada was estimated at \$280,000,000, or double that of the previous year. To meet the situation, the baby budget aimed to increase command of dollar funds for war purchases in the United States by checking luxury imports. It placed an embargo on the import of U.S. automobiles, oysters, tobacco, silks and certain fiction magazines. It was estimated thus to conserve \$50,000,000 of exchange. It imposed new excise taxes (20% to 25%) to check Canadian production of luxuries. To aid the absorption of sterling exchange, it set free from customs taxes British cottons, silks, soft coal, marmalade, furniture, etc.

Rowell-Sirois Commission and Dominion-Provincial Relations.—The second session of parliament was held from Nov. 7 to Dec. 6, with adjournment until Feb. 17, 1941. The chief feature of the session was the announcement that the government approved in general terms of the report of the Rowell-Sirois commission and would summon a conference with the provinces thereon in Jan. 1941. Later advices indicated the acceptance of the invitation by all the provinces.

The appointment of the Rowell-Sirois commission had arisen out of the inadequacy of the powers of the dominion government to meet the newer conditions of industry and the need for social legislation. The unsuccessful attempt of the dominion to enter the field in 1935 led to the appointment of this ambulatory commission which spent two and a half years in holding hearings and receiving provincial and other reports. The commission recommended a redistribution of tax power, confining to dominion authority all income taxes, inheritance taxes and special taxes on corporations (other than those that would fall on individuals). In return, it proposed that the dominion should assume all provincial outstanding debt, with supervision by national finance council of future loans; take over unemployment relief and old age pensions; make special social and educational grants to meet needs of certain provinces, and make loans in aid of primary industries. The constitution of Canada expressed in imperial statutes (B.N.A. act of 1867 and amendments) cannot be amended except by imperial statute. But the Westminster statute of 1931 denies the right of imperial legislation over a dominion. The system is therefore, a riddle of the sphinx: recourse is, therefore, had to a formal (British) amending act passed on request from Canada. Without waiting for the proposed conference on the entire sub-

HIS SMALL CANADIAN BOY said a last good-bye to his father at New Westminster, B.C., in Oct. 1940 as a column of Canadian troops left for an unknown destination in Britain or some part of the British empire

ect involved, the government, with the consent of all the provinces and with the validation of an imperial statute, adopted a federal Unemployment Insurance act. It is modelled on the British statute of 1911, with contributions from workers, employers and the dominion government hired men in primary industries (farming, lumbering, fishing), and all wage earners of over \$2,000 a year.

Relations of Canada with the United States.—The chief feature of interest during 1940 was the increasing measure of aid, "short of war," extended by the United States to the British cause, much of it operative through Canada. The question of the St. Lawrence seaway was much agitated, but nothing final arranged in 1940 as to any new measures. The province of Ontario authorized and announced the diversion of water from the James Bay slope.

Industries.—Every branch of Canadian industry was being ac-

Table I.—Employment Changes in Canadian Manufacturing Industries from Sept. 1, 1939 to Sept. 1, 1940

(Source: Dominion Bureau of Statistics)

Industry	% change + or — from Sept. 1st, 1939 to Sept. 1st, 1940	Indices at Sept. 1st, 1940 as percentages of Sept. 1, 1929
Shipbuilding and repairing	+324%	181.9
Agricultural implements	+76%	72.9
Iron and steel fabrication (misc.)	+51%	92.1

Leather products	+2%	124.0
Beverages	+1%	126.6
Printing and publishing	+1%	101.9
Plant products—edible	—2%	114.2

celerated in 1940 to its fullest capacity to keep in pace with the large war contracts. A statement of the prime minister showed that the Canadian government up to Nov. 4 had made war contracts involving \$443,000,000, of which 87% would be spent in Canada, and had placed in Canada for the British government contracts amounting to \$134,000,000.

Over and above these war contracts there have been placed capital commitments (Canadian \$235,000,000; British \$81,000,000) for new plant construction to meet the needs of the war. Construction contracts for industrial purposes during the first nine months of 1940 were more than four times as great as in the same period for 1939. The building trades have been further stimulated by direct military requirements for barracks, air bases, training fields, etc.

Employment.—As a consequence of this expansion of industry the situation in regard to employment entirely altered. The dominion bureau of statistics announced that towards the close of 1940 the number of persons employed in the manufacturing industries of Canada had reached an all-time record figure. Table I, taken from the October issue of the *Monthly Review* of the Bank of Nova Scotia, shows in detail employment changes in the manufacturing industries from Sept. 1, 1939 to Sept. 1, 1940.

Agriculture.—The wheat harvest for 1940 is officially estimated at 561,104,000bu., an advance over the 1939 crop of 478,965,000bu., itself over the average, and only 5,500,000bu. less than the record crop of 1928. The problem of providing storage for this crop, plus the 1939 carryover, forced the dominion to adopt

Table II.—Quantities of Wheat Deliverable at Canadian Elevators under Quota System, December, 1940

Province	Total No. of elevator points	Bushels per seeded acre				
		8	10	12	15	20
Manitoba	372	83	94	76	90	29
Saskatchewan	1,137	390	266	199	180	102

	2,120	655	525	407	361	172
Per cent of total		30.89	24.76	19.20	17.02	8.11

a quota system with a 70-cent guaranteed minimum price. Table II shows the quantities of wheat farmers may deliver at different points.

The total 1940 estimate for other Canadian field crops is well

above that for 1939, being 547,432,000bu. compared with 518,407,000bu. The livestock industry, the second most important branch of farming, received marked stimulus through the war, especially the production of bacon hogs. Cash income from the principal field and animal products in the period Jan.-June 1940 was 30% higher than for the same period the year before, and the highest since 1930.

At the outbreak of the war between Germany and Great Britain in 1939, an Agricultural Supplies board of six members was formed to establish constructive direction for agricultural production; to make available for export those commodities required by Great Britain; to conserve essential supplies to meet the production of farm products in Canada; and to assist in the marketing of surplus farm products. Other agricultural wartime boards functioning since the outbreak of the war were in 1940 the War-time Prices and Trade board, the Bacon board, the office of wool controller and sugar administrator.

Mining.—Gold production in Canada continued to increase in volume as a measure to build up empire credit throughout the world. In the first six months of 1940 production rose from 2,489,969 to 2,572,042 fine ounces (valued at \$87,551,061 and \$99,023,617). At the outburst of the war the British Purchasing board came to agreements with Canadian producers of copper, lead, zinc, nickel and aluminium to turn over to Great Britain all but a very small proportion of their total output at prices, stabilized by long-term agreements, below the free market. Oil well operations were placed under government control. The output of coal and other non-metallic minerals was increased heavily to meet the rapidly expanding needs of industry. There has been, moreover, since the outbreak of the war, a persistent search for domestic sources of so-called "strategic materials." A plant was completed for the production of refined antimony, before imported largely from China. Large quantities of mercury, formerly secured from Spain and Italy, were obtained from mines in northern British Columbia, sufficient to supply not only Canada's, but a large part of Great Britain's requirements. Supplies of tungsten, manganese and other valuable minerals were found.

Trade.—Total exports in the nine months ending Oct. 1, 1940 (gold excluded) were \$869,000,000, as compared with \$644,000,000 for the same period in 1939, an increase of 36%. Outstanding gains were shown in the export of wheat, wheat flour, meats, lumber, newsprint, wood pulp, primary steel, nonferrous metal and automobiles. Imports on figures for the same period rose to \$768,700,000, an increase of 49% over 1939.

Tourist Trade.—All tourism across the sea vanished with the war. That from Canada to the United States, as apart from business travel, became negligible, partly owing to the restrictions of foreign exchange control. Tourists from the United States to Canada (Jan. 1-Oct. 1, 1940) were estimated at 9,800,000 persons, a decline of 2,000,000 from the same period of the previous year. The income to Canada from U.S. tourism for the whole year is estimated at \$250,000,000, a decline of some \$25,000,000. The decline was partly due to misapprehension about the regulations of entry and departure on both sides of the border. A conference to promote tourism was held in the autumn in Ottawa.

Education and the Arts.—Of necessity the war situation precluded any special developments in the world of art, letters and music. The sessions of the Royal Society of Canada (Ottawa) and of the various art associations were held as usual, and the work of the symphony orchestra in Toronto (Sir Ernest Macmillan, conductor), the Montreal Symphony orchestra (Douglas Clarke, conductor) and Les Frères Symphoniques de Montreal (M. Wilfred Pelletier, directeur musical) were carried on with the same success as before.

(S. LEA.)

War Finance and Industry.—The year 1940 opened for Can-

Table III.—Canada's New Tax on Personal Incomes

	Income	Old Tax	New Tax (Income plus Defence)
Single	\$ 800		\$ 19
Single	1,500	\$ 18	100
Married	2,000		75
Single	4,000	144	525
Married	4,000	84	355
Married, two children	4,000	45.60	223
Married	20,000	3,112	6,530
Married	200,000	103,698	119,430

Exemptions: \$1,000 single; \$2,000 married.

Exemptions: \$750 single; \$1,500 married.

Exemptions: \$600 single; \$1,200 married.

Under the National Defence Tax 2% of the usual \$400 allowance per child is deductible—i.e., \$8 per child.

ada as a nation at war. As a direct war effort the British commonwealth air plan adopted Dec. 1939 was speeded up. It was officially announced from Ottawa in Jan. 1941 that by Sept. 1942 there would be 81 air training schools in operation under this plan with a staff of 40,000. How Canadians will be affected by the new (federal) income tax is shown in Table III.

A necessarily unbalanced budget means borrowing. A deficit can be met by loans only. The following shows how these loans were taken up.

The first loan, offered at mid-January 1940 was \$200,000,000 in 3½s of '52, callable in equal instalments after '48, with the government reserving the right to accept applications for conversion of the maturing Canada 3s of March 1, '40, into an equal percentage value of the new bonds. The loan was offered at par. The offering was made Jan. 15; by the 19th, when books were closed, cash subscriptions had reached a total of \$321,276,000; in addition conversion subscriptions were received totalling \$53,300,000. Of the latter, \$50,000,000 was allotted, making the total amount of the first war loan \$250,000,000. On March 1 the government sold off the market an issue of \$105,000,000 in five-year 2s at 99.37½ to yield 2.13, proceeds of this loan being used in connection with the March 1 and June 1 maturities. At May 1 the gold and foreign exchange holdings of the Bank of Canada, estimated at \$325,000,000, were transferred to the foreign exchange control board and the dominion of Canada issued to the Bank of Canada \$250,000,000 in one-year one per cents, and as the outstanding treasury bill total was subsequently increased by instalments totalling in all \$75,000,000 it was assumed that this expansion was made to complete the transaction. The second war loan, composed of \$300,000,000 in 12-year 3s, was offered at mid-September at 98¾ to yield 3.125, with provision also made for holders of the matured 4½s of Sept. 1, 1940, to convert into the new bonds. The second war loan proved slower of absorption than the first but when the books were closed on the 21st of the month, after being open two weeks, subscriptions had reached a total of \$342,248,300 in addition to which were conversion subscriptions to an amount of \$24,946,200. Total accepted was \$324,946,200, or some \$75,000,000 for the two operations. Supplementing this financing program was the sale of war saving certificates, subscriptions to which reached a total of \$22,639,481 by Nov. 30, and the sale of non-interest-bearing certificates and stamps, which were purchased to the amount of \$4,655,890 by Nov. 30. The year's maturities totalled \$270,013,637, made up of \$115,013,637 in 3s on March 1, \$80,000,000 in 1½s on June 1 and \$75,000,000 in 4½s on Sept. 1. In addition, sterling issues totalling £47,462,777 (\$212,158,604 with sterling at 4.47) were called for redemption, £28,162,775 in 3½s on April 17 and £19,300,000 in 4s on Oct. 1.

On Dec. 30 the finance minister announced the sale to the Canadian chartered banks of \$250,000,000 of 2½-year 1½% notes at 99.695 accrued interest, representing a yield to maturity of 1½%. Proceeds of the sale of the notes will be used to finance war expenditures, to provide funds for repatriation of Canadian securities from the United Kingdom and for general purposes of the government.

In Canada 1940 industry went through an unprecedented era. Canada was being turned into a vast arsenal of the empire, where war equipment was being produced on an increasing scale, the war orders of the department of munitions and supply up to the end of Nov. 1940 amounted to \$872,000,000, including \$692,000,000 on Canadian account and \$180,000,000 on British account. In addition, capital commitments for plant extensions and construction of new plants up to the same date amounted to no less than \$282,000,000.

The effects of these stimuli to the economic activities of Canada were evident in every aspect of the national life. Official estimates indicate that the total number of wage earners in employment increased by 300,000 between Sept. 1939 and the same month of 1940; afterward 50,000 were added. On Nov. 1, 1940, the official index number of employment reached the highest point ever recorded, at 139.2 as compared with 119.6 on Sept. 1, 1939, at the outbreak of the war. In manufactures, taken as a whole, five workers were employed at the later date for every four employed at the earlier. Sixty-one per cent more workers were employed in the iron and steel group of industries at the later date than at the earlier, while

n the shipbuilding industry the increase in employment was no less than 70%. These results were achieved in spite of the placing of some 200,000 men on active service and the conclusion may be drawn that Canada was reaching a position of "full employment."

Increasing employment resulted in great production in those manufacturing industries that were producing war supplies. Thus, comparing the first ten months of 1940 with the same period of 1939, the production of pig iron increased 65%, the production of steel ingots 52% and the production of motor vehicles 45%, as compared with a gain of 25½% in the production of manufacturing industries as a whole. Mineral production was up 12½% and newsprint production 23%. Output of electric power, needed in many of the war industries, rose 7.6% while daylight saving time was being generally continued throughout the winter in order to increase the supply of electricity available for industrial purposes. Again, the value of construction contracts awarded rose by 66% as the result of engineering work and industrial construction required by the war.

Railway Operations Improved.—Notwithstanding a low volume of wheat traffic the railways operated under greatly improved conditions in 1940, owing largely to the heavy movement of war materials, and both gross and net earnings reflected the betterment. In the 51st week of the year, the railway traffic movement as expressed in the official carloadings index was up from 99.4 to 101.2. In these weeks 2,772,000 cars were moved and in the week ending Dec. 21 the index crossed the 100 line for the first time since the recordings began in 1931.

The increasing tempo of Canadian business and the value of Trans-Canada's service to the nation will be found in the statements of the operations of the air line. In 1940 T.C.A. aircraft flew over 5,000,000 mi., carried nearly 1,000,000 lb. of mail, 100,000 lb. of express and 55,000 passengers. The average passenger travelled a distance of 560 mi. in approximately 3¼ hr.

The contrast between the first and last of the year was marked. During the month of January there were carried 2,600 passengers, 45,000 lb. of mail and 7,000 lb. of express; in December approximately 6,000 passengers, 100,000 lb. of mail and 11,000 lb. of express. In January 7,500 mi. were flown each day; in December approximately 15,500.

In Jan. 1939 the company extended its service from Montreal to Moncton, where air connections are made for Halifax, St. John and Charlottetown. April 1940 saw the inauguration of a second daily service between Montreal and Vancouver. By July, London and Windsor had joined the T.C.A. network by direct service. In August a fourth round trip was added to the Toronto-Ottawa-Montreal service.

The mining industry, which played so important a part during the depression years, was of supreme value under war conditions, the gold mines particularly having recovered metal to a value of more than \$200,000,000, a gain of more than 10%. Sold to the United States, this gold was a helpful factor in preventing an adverse exchange situation from becoming as formidable as would have been the case had it been governed only by trade in commodities. Prior to the outbreak of war, Canada was buying United States products at the rate of \$40,000,000 a month or thereabouts. Later, these purchases went as high as \$74,000,000, whereas the increase in exports to United States markets had been only from \$27,000,000 a month to approximately \$40,000,000. Only to a limited extent was the deficit offset by a surplus of trade with other dollar countries. (J. T. C.)

Canadian Literature. The prestige of the costume novel in Evelyn Eaton's *Quietly My Captain Waits*, a spirited romance of old Port Royal, and Frederick Niven's narrative of the Selkirk settlement, *Mine Inheritance*. Both reflect an increasing awareness of the proper use of historical perspective in fiction. An even more noteworthy contribution, in another field, was Ringue's *Thirty Acres*, a penetrating study of modern Quebec life which equals Louis Hémon's masterpiece in sincerity and power.

General literature was distinguished by W. J. Lindal's *Two Ways of Life*, a brilliant presentment of contemporary political ideologies; John MacCormac's much discussed *Canada: America's Problem*; and Paul Bilkey's *Persons, Papers and Things*, the mellow autobiography of a famous Canadian journalist. J. F. C. Wright's *Slava Bohu*, a sympathetic study of the Dukhobors in western Canada, was a worthwhile contribution to sociological literature. The poetry crop was unusually meagre, but E. J. Pratt's *Brebeuf and His Brethren*, a vigorous narrative of the Jesuit missions in Huronia, is worthy of special mention. The year's most interesting publication was Watson Kirkconnell's *The Flying Bull and Other Tales*, a collection of robust ballads which are unique in Canadian letters. Robert Service, of Yukon fame, returned to the field with *Bar Room Ballads*, but the book lacks the novel appeal of earlier volumes in the sourdough tradition. The governor general's awards for 1939 went to Franklin McDowell's *The Champlain Road* (fiction), Arthur S. Bourinot's *Under the Sun* (poetry), and Laura Goodman Salverson's *Confessions of an Immigrant's Daughter* (general). (E. F. GL.)

Canals and Inland Waterways.

The principal inland navigable waters of the United States are the Great Lakes, the New York State canal system, the Mississippi river system, the Atlantic Intracoastal waterway, the Intracoastal waterway from St. Marks river in Florida to Corpus Christi, Tex., the San Joaquin-Sacramento system in California, and the Columbia system in the northwest. The Great Lakes have natural deep water except in the connecting channels, which have been artificially deepened where necessary to accommodate a draft of 24ft.; and the Welland Ship canal joining Lakes Erie and Ontario, as improved by Canada, has a permissible draft of 23.5 feet. The 12-ft. New York State Barge canal is being deepened to 14ft. between the Hudson river and Lake Ontario at Oswego. The Atlantic Intracoastal waterway system between Trenton, N.J. and Winyah bay, S.C., was completed to 12-ft. project depth; from Winyah bay, S.C. to St. Johns river, Fla., dredging was in progress at the end of 1940 to increase the depth from 7 to 12ft.; and from St. Johns river to Key Largo, Fla., 63mi. below Miami, the project depths of 8 and 7ft. have been provided. Dredging in Cape Cod canal to secure a channel width of not less than 500ft. and a depth of 32ft. at mean low water was completed. The Chesapeake and Delaware canal was dredged to 27 feet. On the gulf coast projects were adopted to provide a protected intracoastal waterway not less than 9ft. in depth between St. Marks river, Fla. and Corpus Christi, Tex., more than 1,000mi., and this depth was in general available from Carrabelle, Fla., to Freeport Harbor, Tex. Dredging of the waterway extending southwest of Freeport was in progress. The Mississippi river has a 35-ft. depth to Baton Rouge, a 9-ft. depth from Baton Rouge to St. Louis and thence by a series of 26 locks and dams a channel of 9-ft. depth to Minneapolis, Minn. Beginning in 1940, the latter reach was in operation throughout for the first time.

Traffic on Major Canals and Inland Waterways of the U.S. for 1939

	Tons*
St. Clair Flats Canal	81,562,654
St. Marys Falls Canal	69,850,262
Mississippi River, Minneapolis to The Passes	29,506,270
Sabine-Neches Waterway	40,096,532
Houston Ship Channel	28,174,710
Ohio River	25,955,345
Monongahela River	21,870,916
Louisiana-Texas Intracoastal Waterway	8,167,640
New York Barge Canal	4,689,037
Cape Cod Canal	4,982,234
Chesapeake and Delaware Canal	3,034,807
New Orleans Navigation Canal	2,413,680

*Information as to the value of traffic for 1939 was not available.

The total traffic of United States canals and waterways in 1939 was computed after eliminating all known duplications of traffic at 329,419,983 short tons. (For statistics regarding the Panama canal see PANAMA CANAL AND CANAL ZONE. See also AQUE-DUCTS.) (J. L. S.)

Great Britain.—As in other spheres of engineering activity, the European war to a large extent arrested progress in canal and inland waterway development in Europe. Certainly, in the British Isles, there is little of importance to record for the year 1940. In England, the catchment boards, so far as was compatible with the national situation, carried on their programs of river improvement, but these, with some few exceptions, were mainly concerned with drainage problems and the provision of relief from liability to floods. From the point of view of navigation, the river Nene was in 1940 the subject of further ameliorative treatment and various locks were in course of reconstruction, while the bed of the river was dredged to afford greater depth in the navigable channel. An item of interest was the closing of the Cumberland arm and basin in the London area of the Grand Union

WORK on the Pinsk-Brest-Litovsk canal was rushed in 1940 to complete the third system of inland waterways by which Russian supplies are transported to Germany

Canal company, which became redundant and was no longer required.

Germany.—Germany has always pursued an energetic policy for the development of her inland waterways, and several important projects were under way, but with what amount of progress during 1940 it is not possible to say for reasons connected with the war. In one respect there was a definite set-back. The Dortmund-Ems canal, an important traffic route in north-west Germany, was the objective of repeated bombing attacks by the British royal air force, and in July the double aqueduct over the river Ems at Fuestrup, about eight miles north of Münster, was reported to have been seriously damaged, if not destroyed. The canal, which has a length of 170 mi., connects the industrial town of Dortmund with the seaport of Emden.

Hostile demonstrations of military force were particularly evident in Belgium, where numerous wrecked bridges blocked the waterways of that country. About 16 bridges were reported demolished on the canal connecting Roulers with the river Lys, 18 bridges on the Courtrai-Scheldt canal and 30 bridges along the river Lys itself. Such obstructions were, of course, only temporary, but they crippled traffic for the time.

Russia.—In Russia, equally energetic with Germany in inland waterway development, the U.S.S.R., following the completion of the White sea-Baltic and the Moscow-Volga canals, was busily engaged in the execution of other projects in her five-year plan. Among these was the Greater Volga scheme, undoubtedly an enterprise of exceptional magnitude. It is designed to intercept the Volga and its tributaries by means of 15 immense dams so as to form a series of large artificial lakes, which will serve for the creation of hydro-electric power. The Volga itself will be rendered navigable along its entire course, not only for shallow-

draft river craft, but also for large sea-going vessels coming from the Baltic, sea of Azov and the White sea, through a system of canals, either already constructed or to be constructed during the next few years. Farther west, the Dnieper-Bug waterway, connecting the western districts of Belorussia and the Ukraine with south Russia, was completed and brought into operation.

Work was begun on the Dnieper-Niemen waterway (315 mi. long) which will link up the river Yaselda, a tributary of the Pripet, with the Shchar, a tributary of the Niemen. Through the Niemen and the Dnieper, the new waterway will provide access from the Baltic to the Black sea. The scheme will entail the building of 30 locks and the route has been divided into 11 sections on which preparatory work is already in hand. The waterway will be available for traffic in 1941. (B. Cu.)

Canal Zone: see PANAMA CANAL AND CANAL ZONE.

Cancer. Some 15 years ago when a great deal of scientific activity was being exerted in the study of the peculiar chicken sarcomas which were discovered by Rous at the Rockefeller institute great interest was aroused by the fact that the tumour could be transplanted by a germ-free filtrate. This property was not constant; at times the tumour could not be transplanted and then it would regain that quality. It has been assumed, but not proved, that the carcinogenic agent was a virus. The phenomenon was so unusual that a vast series of experiments were made on other animal tumours and a mouse tumour known as 37S was found to be occasionally transmissible.

Of course, the question arises as to whether the filters employed were impermeable to fragments of cells and whether the tumour could not be started from fragments of cells or of nuclei or that the tumour tissue contained some chemical carcinogenic substance.

About this same time, Morris, at the Institute of Cancer Research of Columbia university, made a large series of filtration experiments using the Flexner-Jobling rat carcinoma. Many hundreds of rats were inoculated with filtrates and four developed tumours of the breast, though in that strain no such breast tumour had hitherto appeared.

Since that time a large number of non-specific carcinogenic substances have been discovered, which on injection subcutaneously into mice and rats produced tumours in small numbers. Among these are concentrated solutions of glucose and even of common salt. The synthetic hydrocarbons of the phenanthrene group are, of course, not under discussion, as they are capable of inducing tumours in almost 100% of animals when properly applied.

For some years a Russian author by the name of L. M. Shabad had been publishing papers in which he pointed out that benzene extract of liver tissue from persons with carcinoma of the stomach was capable of producing malignant growths in mice. Recently others, notably Menke (*Science*, 92:290, 1940) and Steiner (*Science*, 92:431, 1940), have confirmed these findings. Shabad has also shown (*Am. J. Cancer*, 39:463, 1940) that not only does the benzene extract of liver from patients with carcinoma produce cancer, but also similar extracts from livers of persons without cancer will produce malignant growths in mice and this has also been confirmed by Des Ligneris and also by Hieger. There has been considerable misunderstanding of the nature and importance of these discoveries.

All that these experiments mean is that the non-saponifiable residues extracted from the liver by benzene may induce the appearance of a few tumours in the highly susceptible albino mice which were used for such tests. These experiments merely add one more carcinogenic agent to the vast number which have already been published in the literature of the experimental study of cancer.

It is still too early to attempt to theorize as to whether the carcinogenic substance is derived from the food and is concentrated in the liver, or whether the normal liver contains traces of substances which under the extraction processes referred to possess a moderate carcinogenic power. Neither is it certain that the carcinogenic properties are due to a substance present in the liver or whether a body like cholesterol is so altered by the process of extraction that it becomes carcinogenic. Merely melting cholesterol will make it slightly carcinogenic.

It is doubtful that carcinogenic substances are present in malignant tumours, with the exception noted in the first and second paragraphs, for the vast number of animal experiments with ground up tumour tissue or with filtrates from ground up tumour issue have failed in all but a minute portion of cases.

Nevertheless, the production of neoplasms, both in man and animals, by either hydrocarbons derived from tar, soot, or some of the dyes like alpha-naphthylamine, or from chemicals excreted by parasites like bilharzia in man and taenia crassicola has laid a firm foundation for the belief that certain chemical substances are capable of inducing the low-grade proliferative process which precedes the formation of animal and human cancer. (See also ALIMENTARY SYSTEM, DISORDERS OF; EYE, DISEASES OF; MEDICINE.)

Candid Camera: see PHOTOGRAPHY, MINIATURE CAMERA.

Candy. Confectionery, largely a penny business, is the sixth most important division of the food industry in the United States. It is a penny business because the bulk of confectionery, including chocolate, is sold in penny units. Often referred to as a depression-proof industry, profits in candy making and selling have steadily decreased since 1921, considered the peak year. The decline has been due primarily to faulty and loose price structure.

According to the department of commerce, there are in the United States some 1,200 manufacturers of candy employing over 50,000 people, producing about 2,000,000,000 lb. of candy annually, with a wholesale volume of just under \$300,000,000 and a retail volume of almost \$600,000,000. But only 38 firms do an annual business of \$1,000,000 or over, 65 firms are responsible for almost 60% of the output and about 200 firms do over 80% of the industry's tonnage. Candy is sold through some 500,000 outlets, from the corner candy store to even the shoe shine parlour. Chicago is the production centre. Boston, New York and Philadelphia follow in importance. Preliminary report for 1940 indicated a sales increase of 8% to 10% over 1939. The increase in raw materials started in 1939 because of the war, continued in 1940, with the result that candy prices were a little higher in 1940 than in 1939. However, prices were still low as compared with raw material costs. The average value per pound of candy in 1940 was a little over 16¢ as compared with 15¢ in 1939 and 14¢ in 1938. Per capita consumption in the United States was close to 17 lb., which means that the average American consumer buys about \$2.70 worth of candy annually.

As a result of the European war, imports of candy in 1940 were reduced to record minimum. According to estimates, some 900,000 lb. of candy, valued at \$140,000, were imported to the United States in 1940. Whereas such countries as Great Britain, Germany, France and Holland had hitherto shipped a great deal of candy to the United States, practically the only countries that exported candy to the United States in 1940 were Estonia and soviet Russia. As a result, one of the most interesting developments of the candy industry in 1940 was the production and development of "foreign" types of candy by domestic producers. Very little candy was produced in Europe and the only items still made in some of the countries, particularly Great Britain, were chocolate, and these were principally for consumption by soldiers.

Because of the war, the export market for candy shrunk to an insignificant minimum in 1940. In December, the Canadian government banned the importation of candy and chocolate from the United States as well as from other countries. The industry tried to make up for this shrinking volume by greater promotion in domestic consumption and by opening new export markets in South and Central America.

(H. D. G.)

Cane Sugar: see SUGAR.

Canning Industry. U.S. and territorial canned food production in 1940 totalled about 334,000,000 cases, compared with 315,931,000 cases in 1939, and 234,146,000 cases in 1929. Production of canned food since 1930 has increased much faster than the population. On a per capita basis, production has increased about 45% since 1930, and, at the same time, prices of canned foods in general have declined.

Fruits and vegetables were the canned food items packed in largest quantity, amounting to about 245,000,000 cases in 1940. The next largest item was canned milk, of which 58,000,000 cases were packed. The 1940 fish and meat pack totalled about 31,000,000 cases. The canning industry during 1940 used over 10,000,000,000 tin containers, gave employment to about 375,000 persons and utilized a portion of the crops grown by 360,000

farmers. There was an improved market condition for canned foods, due to increase in employment in the U.S. and to the improved condition of business generally.

Legislation.—Developments concerning labelling of canned foods under the Food, Drug and Cosmetic act of 1938 were: the labelling provisions of the act, which were postponed by the Lea act, became fully effective on July 1, 1940; standards of identity, quality and fill of container for apricots, peaches, pears, cherries and peas, and standards of identity for about 40 unmixed vegetables became effective in 1940 in time for the new packs; hearings were held on various proposed amendments to existing standards; an amendment was disapproved which would have permitted the addition of sodium benzoate to catsup as an optional ingredient; a hearing was held to determine labelling provisions of foods represented for special dietary uses as provided for in section 403 (j); identity standards for canned fruits (peaches, pears, apricots, cherries) were brought to re-hearing to determine what labelling should be required where various sweetening agents (sucrose, dextrose, corn syrup, invert syrup) may be used in preparation of syrup.

Research.—There was further technological research devoted to improvement of quality of canned foods. Studies of processing, or sterilization, were continued. Most important were the results of researches on chlorophyll preservation which have demonstrated that it is possible to retain the normal colour of green vegetables.

National Defence.—The National Defence council in 1940 called for the co-operation of the canning industry in anticipation of the subsistence problem for 1941 and subsequent years. In response, the industry took part in revision of specifications for government purchases and acted in other ways to facilitate purchase and delivery of supplies in the emergency period.

(E. J. C.)

Canton Island: see SOUTH SEA AND EQUATORIAL ISLANDS.

Cantu, Giuseppe (1873–1940), Italian vice-admiral, was born at Orzinuovi, Brescia, May 24, and was educated in the Royal Naval academy. He was aide-de-camp to the commander of the naval division of the far east in 1899 and 1900 and later became aide to the commander of the Royal Italian navy. He saw service in the war against Turkey (1911–12) and was in China during the Boxer rebellion. He was named a rear admiral in 1925. In 1935 he was president of the Council of the Royal Italian navy. He was retired in 1936 and in 1938 was named a senator. At the time of his death in New York city, Oct. 24, he was serving as head of the Italian commission to the World's Fair in that city.

Cape Verde Islands: see PORTUGUESE COLONIAL EMPIRE.

Carnegie Trusts. Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with \$135,000,000, expends its annual income in grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British dominions and colonies.

During 1939–40, the corporation trustees appropriated a total of \$4,696,485: library interests, \$374,520; adult education, \$218,000; fine arts and museums, \$459,500; research and publication, \$2,030,750; general educational purposes in schools, colleges, universities, etc., \$1,613,715. The amount appropriated since 1911 totals \$181,425,174.

The five other separately administered Carnegie organizations

in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the corporation with endowments now ranging from \$10,000,000 to \$30,000,000, followed their established programs described regularly in the annual publications.

Carnegie Institute of Pittsburgh (1896), which comprises institute of technology, a museum of fine arts, a music hall, museum of natural history, a public library and a library school, carried out its normal programs. The annual international exhibit at the museum again attracted wide attention.

Carnegie Institution of Washington (1902), devoted to scientific research, has expended since its organization \$41,618,500 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson observatory), terrestrial magnetism, geophysics, animal and plant biology and historical research (especially in Yucatan).

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed in the United States of America, the Dominion of Canada, the Colony of Newfoundland, and the waters thereof by persons the nature of whose duties in following the regular vocations does not necessarily require them to perform such acts, announced that the list of its beneficiary aid shows a total of 3,126 recipients of medals and 327 persons now receiving pensions. During the 1939–40 fiscal year, 41 persons received educational awards and 36 others received pecuniary awards for specific purposes. Its awards for the year 1939 totalled \$187,922.54.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid \$1,945,191.75 in retiring allowances to retired college professors, or their widows, making a total of \$38,639,613.05 paid for such purposes since its establishment. It has also continued, chiefly from funds provided by the corporation, its program of educational research, including such activities as teacher-testing program, graduate examination study and a comparative examination study.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, expended \$625,650 in its efforts to further friendly understanding among the nations of the world. Continued progress was made also in the study of Canadian-American relations, the findings of which are being reported in 44 volumes, published chiefly by Yale university, Ryerson and Oxford presses. This activity was made possible by corporation grants to the endowment. (R. M. LE.)

Carol II (1893–), king of Rumania from 1930 to 1940, was the eldest son of King Ferdinand and Queen Marie. For his earlier career, see *Encyclopædia Britannica*, vol. 4, p. 904.

The tenth anniversary of Carol's reign on June 8, 1940, was celebrated with foreboding for the future. Disaster in fact soon overtook both the king and his country. Within three months Carol was forced to yield Bessarabia and northern Bukovina to Russia, southern Dobruja to Bulgaria and about half of Transylvania to Hungary. Then, in a last desperate effort to save his tottering regime, Carol on Sept. 5 appointed Ion Antonescu (q.v.) prime minister and conferred dictatorial powers upon him. But Antonescu's first act was to demand Carol's abdication, and on Sept. 6 the king vacated the throne in favour of his son Mihail (q.v.). Fleeing the country with his friend Magda Lupescu, he barely escaped assassination when his train was fired upon by Iron Guardists at the Yugoslav border. He travelled to Switzerland, then to Seville, Spain, where he arrived Oct. 13. Meanwhile the new government had conducted inquiries into his royal

come and threatened to ask his extradition from Spain. The Spanish government placed Carol and Lupescu under guard Oct. 2, but at the end of the year had returned neither to Bucharest.

Caroline Islands: see PACIFIC ISLANDS, MANDATED.

Carson, John Renshaw (1887–1940), U.S. research engineer, was born in Pittsburgh, Pa., June 28, was graduated from Princeton university in 1907 and pursued graduate study in the Massachusetts Institute of Technology for the next year. He was an instructor in physics at Princeton from 1912 to 1914 and in the latter year was engaged by the American Telephone & Telegraph company as engineer of the development of transmission theory. He received the Elliott Cresson medal of the Franklin institute in recognition of his work in perfecting electrical communication, and the Liebmann prize of the Institute of Radio Engineers for his inventions in radio and his contributions to the theory of electrical circuits. He died in New Hope, Pa., Oct. 31.

Catholic Rural Life Conference, National.

Well planned to give practical information and zealous leadership in rural life, the 18th annual convention was held at St. Cloud, Minn., in Oct., 1940. Pastors, teachers, farmers, homemakers, young men and young women, in all some 10,000 delegates, took part in the discussion meetings.

Resolutions were passed to bring rural life to its proper orbit through a great increase in the number of family-size, owner-operated farms. Adjustments of rural education to rural needs, the building of rural co-operative enterprises, the revitalization and conservation of the soil and improvements in economic, social and religious situations in all parts of rural U.S. were carefully planned. Founded in 1923 by the bishop of Kansas City, Mo., the Most Rev. Edwin V. O'Hara, the conference devotes its efforts to care for the underprivileged Catholics on the land, to keep on the land Catholics who are on the land, to settle more Catholics on the land, to bring economic, social and spiritual security to the U.S. agriculturist.

The conference co-operates with the National Catholic Rural Life Bureau of Washington, D.C., and state and federal agencies. Its publications are the *Manifesto on Rural Life*, *Catholic Rural Life Objectives*, *The Catholic Rural Life Bulletin* (the official quarterly magazine), and a series of pamphlets on the farm and the productive home. In addition to vacation schools for rural areas, a number of rural life summer schools for pastors and other rural leaders were conducted.

The Most Rev. Vincent J. Ryan of Bismarck, N.D., was re-elected president. Rt. Rev. Luigi G. Ligutti was elected executive secretary. The conference headquarters were in 1940 at 525 Sixth avenue, Des Moines, Ia. (F. X. T.)

Catholic Welfare Conference, National. Organized in Sept., 1919 by the Catholic hierarchy of the United States, the N.C.W.C., as it is popularly called, is the unifying principle of Catholic action. It is the common agency, acting under the authority of the bishops, to promote the welfare of Catholics in the United States. Its incorporated purposes specify "unifying, co-ordinating and organizing the Catholic people of the United States in works of education, social welfare, immigrant aid and other activities."

The conference operates under the authority of the 136 cardinals, archbishops and bishops of the United States. Reports are submitted to them, and authorization for new developments are sought from them, at their annual meeting in November. The N.C.W.C. was in 1940 governed by an administrative board of ten archbishops and bishops, assisted by seven supplementary bishops. Most Rev. Edward Mooney, archbishop of Detroit, Mich., succeeded Most Rev. Samuel A. Stritch, archbishop of Chicago, Ill., as chairman of the administrative board. Most Rev. John B. Peterson, bishop of Manchester, N.H., remained as vice-chairman. Most Rev. Francis J. Spellman, archbishop of N.Y., was named secretary. The Rt. Rev. Michael J. Ready was re-appointed general secretary. The executive offices were moved to the building formerly known as the Apostolic Mission house, Catholic University of America, Washington, D.C. The official publication, *Catholic Action*, is published monthly.

Activities of the N.C.W.C. are directed through departments, bureaus and committees, each administered by an episcopal chairman. These include eight departments:

Executive.—Exercises general supervision, business and auditing, publications, etc.; maintains the Bureau of Immigration and assists the Confraternity of Christian Doctrine. **Education.**—Stimulates extension and efficiency of the Catholic school system, which embraces 2,606,362 students; engages in statistical and research work; studies legislation involving education. **Press.**—Issues the N.C.W.C. *News Service*, a weekly release supplied to 468 Catholic publications. **Social Action.**—Covers the field of family life, rural life, social welfare, industrial relations, international affairs. **Legal.**—Analyzes federal, state and local legislation affecting Catholic interests, and serves as an information centre on such matters. **Lay Organizations.**—Functions through the National Council of Catholic men and the National Council of Catholic women. The former is affiliated with other Catholic organizations of men, conducts a Catholic Evidence bureau and sponsors the weekly broadcast, "The Catholic Hour," heard over 95 radio stations. The latter flourishes in 63 dioceses of the United States, is affiliated with Catholic societies of women, and supports a school of social service. **Catholic Action Study.**—Investigates and reports on Catholic action at home and abroad. **Youth.**—Authorized in 1940 for the purpose of co-ordinating youth organizations and activities and furthering the National Catholic Youth council. **Committees.**—Among these are the following: Motion Pictures, which directs the Legion of Decency; Decent Literature; Catholic Refugees, which has collected \$347,332; Polish Relief, which reached a total of \$383,240. New projects approved were the establishment of a National Catholic Community service, to co-ordinate Catholic activities connected with U.S. preparedness and defence, and the reorganization of the American Board of Foreign Missions. (F. X. T.)

Cattle. The number of cattle on United States farms and ranches increased by about 2,000,000 head in 1940, the department of agriculture estimated, and on Jan. 1, 1941 the total of cattle and calves had reached 70,800,000. The peak year was 1934, when there were 74,300,000 cattle and calves on United States farms and ranches. The severe droughts of 1934 and 1936 greatly reduced the herds so that there was a downward trend to a low of 66,100,000 head in 1938. Since then there has been a steady increase and the current rate of slaughter for beef and veal, the department estimated, should be about 26,000,000 head annually, or 10% over the number slaughtered in 1939 or 1940. The years 1939 and 1940 were approximately the same as to the number of animals slaughtered and the number on feed, 1940 being only slightly higher in both categories. The department of agriculture predicted in 1940 that the number of cattle in the

BRANDING CATTLE during a Texan roundup of 1940

United States would probably increase until 1945 and that the rate of slaughter might rise to 28,000,000 yearly before a downward trend in the cycle. Prices for prime beef cattle reached the highest level in three years in Oct. 1940, prime steers being about \$2.50 per 100lb. higher on that date than a year earlier while good grades were about \$2 higher. Lower grades were about the same as in 1939 and for the first nine months stockers and feeders at Kansas City averaged \$8.54 per 100lb. in 1940 and \$8.45 in 1939. Fewer cattle were on feed in 1940 in the eastern corn belt states, but in the western corn belt states the number increased. In the four months July-Sept. 1,292,000 feeders were shipped into eight principal feeding states compared with 1,164,000 shipped in 1939 into the same states, which are Iowa, Illinois, Ohio, Indiana, Michigan, Wisconsin, Minnesota and Nebraska. Imports of cattle (almost entirely from Canada and Mexico) were 480,000 head in the first nine months of 1940 and 611,000 in 1939. The Canadian shipments in that period were 179,000 head in 1940 and 232,000 in 1939; the Mexican, 301,000 in 1940 and 379,000 in 1939, consisting chiefly of young feeder cattle of 200 to 669 pounds. Canada may ship 52,000 head of cattle into the United States each quarter year at the reduced import duty of 1½ cents per lb. The Mexican quota is 8,280 head per quarter. The full import duty is 2½ cents per pound.

Livestock losses from German aeroplane bombing in the United Kingdom were "not so heavy as had been expected and are by no means excessive," Lloyd V. Steere, United States agricultural attaché at London, reported. Cattle and sheep suffered most owing to their habit of herding together when feeding in pastures, where most of the damage occurred rather than in barns. Much of the stock killed was salvaged and compensation was paid by the British food ministry. No compensation was paid where slain animals could not be used for food. German occupation of the Channel islands in the summer of 1940 caused a feeling of grave concern

among United States breeders of Guernsey and Jersey cattle which originated on the Channel islands of Guernsey and Jersey where for centuries the two famous breeds have been developed and which provided the original foundation for the purebred Guernsey and Jersey herds in the United States and Canada. Breeders' publications in the United States reported that no information could be obtained as to the disposition of the island herds, numbering about 6,000 head on the island of Guernsey and about 10,000 on the island of Jersey, after the occupation by Germany. None of the cattle was evacuated. Although a majority of the population was removed to England, island breeders refused to leave their herds. (See also MEAT.) (S. O. R.)

Cellulose Products. With Russia taking Finland's wood pulp and Germany that of Norway and Sweden, the United States and Canada were called on not only to meet increased domestic requirements but to supply South America, Africa, Asia, Australia and India in 1940.

Modification of old methods and development of new ones permitted the utilization of cellulose from such sources as Douglas fir, processed in the United States to give a high grade pulp; chestnut chips, a United States source of semichemical pulp for making corrugated paper and container board; cacao shells, processed by a German method to make rayon; southern yellow pine made commercially in the United States both into newsprint and into rayon; cornstalks used in Hungary for making paper, and Italy for making rayon and cellulose derivatives including nitrocellulose; and ulla grass, made into wrapping paper in India.

Bacterial control in pulp and paper making was desirable since bacterial activity gives rise to slime, degrades stored pulp and causes fermentation of stock, rotting of felts and mildewing of finished products. Chemicals found efficient for combatting such conditions are sodium pentachlorophenate and other synthetic phenolic derivatives. Because of their nonreactivity these organic germicides have an advantage over chlorine; they are not quickly spent.

A very light weight wood product suitable for structural insulation was made by disintegrating wood waste or pulverized jack pine in water, treating with a foaming agent, drying and forming into sheets. Wood waste was used in making moulding powder for plastics and laminated wall board for structural sections, the latter type of product even being used for roof beams in prefabricated houses. Heat-treated under pressure, wood becomes extremely dense, with the lignin naturally present itself serving as plastic.

This product has essentially the properties of a phenolic laminated plastic and is competitive with such materials.

Notable improvements in old products included wrapping paper high in wet strength, book paper that will not crumble or yellow with age, paper board with a better surface for printing, and frozen-food containers resistant to moisture both within and without.

Viscose was processed in a number of new ways; in Italy and Belgium it was mixed with casein in the spinning solution to give a new type of staple rayon fibre; in Great Britain and Germany synthetic resins were incorporated directly into the viscose spinning solution and thus became an integral part of the fibre. Research was directed toward making rayon fibres more water-repellent and more resilient. Other treatments resulted in the making of carpets entirely from rayon and the making of blankets from mixtures of rayon with wool. Claimed to be three times as strong as natural silk, a cellulose acetate yarn was in use for

making parachutes for the R.A.F., filter cloths and conveyor belts. (See also PLASTICS INDUSTRY; RAYON.)

Cement. Total cement production in the United States rose 16% in 1939, to 124,698,000 barrels. The great bulk of the output was the ordinary Portland cement; the special types of masonry, natural and pozzolanic cements averaged only 1-2% of the total, while high-early-strength cement increased to 3%.

Both production and shipments in the United States in 1940 were estimated to be about 6% ahead of 1939, at about 129,000,000 bbl., with shipments probably slightly in the lead, as in 1939. Canadian production in 1939 totalled 5,731,000 bbl., and through Sept. 1940 was 12.5% ahead of the same period of 1939, indicating that the total for the year would be about 7,000,000 barrels.

World production, estimated at 88,850,000 metric tons in 1938, was distributed as follows: United States 22%; Germany 17%; United Kingdom 9%; Japan 7%; U.S.S.R. 6%; Italy 5%; France 5%; Belgium 3%; Czechoslovakia, Poland, India, Canada, South Africa, Yugoslavia and Australia 9%; the remaining 17% is widely scattered in small amounts. (See also GYPSUM.)

(G. A. Ro.)

Census, 1940. The 1940 census of population is the 16th such census to be taken in the United States. The first census, taken in 1790, covered the territory now occupied by 18 states and showed a total population of a little less than 4,000,000. The main purpose of the census, under the provisions made for it in the constitution, was to secure a basis for the apportionment of representation (and direct taxes) among the states, in accordance with the number of persons residing in the several states. The apportionment population was a purely quantitative measure, except for the one element of quality embodied in the provision that five slaves should be considered equivalent to three free persons. Decade by decade additional items of classification have been added to the census program, however, so that the present-day census is far from the simple count of population classified only by sex, colour, status as free or slave, and broad age groups, with which the series of decennial censuses was initiated. Even now, however, inquiries for purely quantitative data, namely, the total population of specified areas on specified dates, are more frequent than any other one kind of inquiry received by the Census bureau.

The first item of information to be made available from any census for the United States and its thousands of political subdivisions (states, counties, cities, towns, villages, townships, etc.) is this simple count of the population. In the 1940 census this was followed closely by the count of dwelling units from the housing inquiry, these being classified as occupied and vacant and the number of occupied dwelling units being approximately the same as the number of households or families. Ordinarily, no further classifications of population would be available until after the completion of the preparation and tabulation of the punched cards—one for each person in the population. Provision was made in the 1940 census, however, for the selection of a 5% random sample, and from this sample have been punched preliminary cards from the tabulation of which certain fundamentally important classifications are (Feb. 1941) available, several months in advance of the earliest possible date on which the tabulation of the whole number of population cards can be completed. Data

from this source relating to a number of topics are presented below.

Population Growth.—The population of continental United States on April 1, 1940, the date of the 16th census, was 131,669,275, as compared with 122,775,046 on April 1, 1930, the date of the 15th census. The increase in population during the decade ending in 1940 thus amounted to 8,894,229 persons. While this is a considerable number, it represents a gain of only 7.2% which is the smallest relative increase ever recorded in U.S. census history.

In 1790, when the first census was taken, the population was just short of 4,000,000. Each subsequent decennial census up to 1860 showed an increase of about one-third over the preceding one; from 1860 to 1910 the decennial increase was around 20 or 25%; for the next two census decades the figures were 14.9% and 16.1%, respectively; and for the period from 1930 to 1940 the increase, as indicated above, was only 7.2%, or less than one-half the smallest previous increase. The data for the 16 censuses are given in Table I.

Table I.—Population of the United States: 1790 to 1940

Census year	Population	Increase over preceding census	
		Number	Per cent
1940	131,669,275	8,894,229	7.2
1930	122,775,046	17,064,426	16.1
1920	105,710,620	13,738,354	14.9
1910	91,972,266	15,977,691	21.0
1900	75,994,575	13,046,861	20.7
1890	62,947,714	12,791,031	25.5
1880	50,155,783	10,337,334*	26.0
1870	39,818,449*	8,375,128*	26.6
1860	31,443,321	8,251,445	35.6
1850	23,191,876	6,122,423	35.9
1840	17,069,453	4,203,433	32.7
1830	12,866,020	3,227,507	33.5
1820	9,638,453	2,308,572	33.1
1810	7,239,881	1,931,398	30.4
1800	5,308,483	1,379,269	35.1
1790	3,920,214		..

*Revised figure.

Immigration and Emigration.—The two principal causes for the slowing down of population growth are the cessation of foreign immigration and the decrease in the birth rate. During the decade 1930-40, emigration exceeded immigration. The observed population growth during this decade is therefore due entirely to natural increase, the excess of births over deaths. In fact, for the first time in the history of the United States, the number of emigrants during an intercensal period was greater than the number of immigrants. During the decade from April 1, 1930, to April 1, 1940, the number of persons who left the United States for foreign lands exceeded by 46,518 the number who entered the United States. This is in sharp contrast with the period between 1920 and 1930, when the net immigration amounted to about 3,250,000. This change alone explains a considerable part—though by no means the greater part—of the reduction in the average annual population increase from 1,700,000 between 1920 and 1930 to about 900,000 in the decade just past.

Birth and Death Rate.—The progressive decline in the birth and death rates is shown in Table II. The states which were in the birth registration area in 1920 had a collective rate of 23.7 per 1,000. In 1930 the states then in the registration area had a rate of 18.9. The lowest observed rate was that for the depression year of 1933, 16.6. Since then the birth rate has risen somewhat, but it was still only 17.3 per 1,000 in 1939. Death rates have likewise fallen from 13.0 per 1,000 in 1920 to 11.4 in 1930 and 10.6 in 1939. The downward trends in these two rates are of great significance in their influence on population characteristics. A falling birth rate means that the United

States population will increase more and more slowly, and eventually become stationary or even begin to decline. On the assumption that present trends will continue, it is estimated that the population will be about 139,000,000 in 1950 and about 144,000,000 in 1960. By perhaps 1970 or 1980 the population will probably have reached its maximum and will remain stationary or even begin to decline.

Table II.—Births and Deaths in the United States: 1920 to 1940

(In 1920 the birth registration area included 59.8% of the total population of the country, and the death registration area 82.2%. These areas were gradually extended, until in 1933 both areas included the entire country. The figures shown in this table for the years 1920 to 1932 include estimates for that part of the country not in the registration area)

Year	Number of births (thousands)	Number of deaths (thousands)	Excess of births over deaths (thousands)	Rate per 1,000 of the population		
				Births	Deaths	Excess of births
1939	2,266	1,388	878	17.3	10.6	6.7
1938	2,287	1,381	906	17.6	10.7	7.0
1937	2,203	1,450	753	17.1	11.3	5.8
1936	2,145	1,479	666	16.8	11.6	5.2
1935	2,155	1,393	762	17.0	11.0	6.0
1934	2,168	1,307	771	17.2	11.1	6.1
1933	2,081	1,342	739	16.6	10.7	5.9
1932	2,178	1,360	818	17.5	10.9	6.6
1931	2,232	1,374	858	18.0	11.1	6.9
1930	2,328	1,396	932	18.9	11.4	7.6
1929	2,291	1,448	843	18.9	11.9	6.9
1928	2,368	1,446	922	19.8	12.1	7.7
1927	2,440	1,352	1,088	20.6	11.4	9.2
1926	2,412	1,428	984	20.7	12.3	8.4
1925	2,407	1,360	1,107	21.5	11.8	9.6
1924	2,534	1,328	1,206	22.4	11.7	10.7
1923	2,478	1,360	1,118	22.2	12.2	10.0
1922	2,456	1,290	1,166	22.3	11.7	10.6
1921	2,622	1,253	1,369	24.2	11.6	12.7
1920	2,522	1,389	1,133	23.7	13.0	10.6

The decreasing death rate reflects the increasing length of life. This is shown by the fact that the life expectation of white males increased from about 48 years in 1901 to about 59 years in 1930, and that of white females from about 51 years in the earlier period to over 62 years in 1930. Since 1930 the life expectation has probably increased still further, although exact data are not yet available.

To summarize the birth and death rates in another fashion, we may note that the net reproduction rate for the United States is decreasing rapidly, having fallen from 111 in 1930 to about 96 in 1940. This rate is a measure of the degree to which a population will eventually reproduce itself; a net rate of 100 would mean that birth and death rates were such that the population in the long run would neither increase nor decrease. The net reproduction rate of 96, therefore, means that under present fertility and mortality conditions the population of the United States will eventually fail to maintain its numbers by approximately 4% per generation. A significant difference in this respect exists between the white and nonwhite population of the United States. If present birth and death rates continue, the nonwhite population of the United States will, in the long run, increase at the rate of about 7% per generation, while the white population will decrease at the rate of about 5% per generation.

With the cessation of immigration and the decline in the birth rate, changes in the character of our population will take place. To some of these, especially the increase in average age and the decrease in the proportion of males, specific reference is made below (see p. 142).

Urban and Rural Population.—One of the fundamental classifications of the population of the United States is that which separates the urban population from the rural. The urban population comprises, in general, all persons living in incorporated places (cities, towns, villages or boroughs) having a population of 2,500 or more; while the rural population is made up of persons living outside such places. On April 1, 1940, the urban

population numbered 74,423,702 and the rural population 57,245,573. In 1930 the urban population was 68,954,823 and the rural population 53,820,223. The increase in the urban population between 1930 and 1940 thus amounted to 5,468,879, or 7.9% and the increase in the rural population to 3,425,350, or 6.4%. The urban population now forms 56.5% of the total population of the United States, as compared with 56.2% in 1930.

The growth of the urban population was very much slower in the decade just past than in the period between 1920 and 1930—7.9% as compared with 27.3%. This is partly the result of the slowing down in the rate of growth of the total population from 16.1% between 1920 and 1930 to 7.2% between 1930 and 1940. The increase in the rural population during the most recent decade, however, was more rapid than in the period between 1920 and 1930—6.4% as compared with 4.4%.

The recent increase in the relative importance of rural growth may be brought out even more clearly by comparing directly the urban and rural rates for each of the last two decades. Between 1920 and 1930 the rate of urban growth was more than six times the rate of rural growth (27.3 as against 4.4), while during the decade just past the rate of urban growth was only slightly higher than the rural rate (7.9 as compared with 6.4).

The total increase in the population of the United States between 1930 and 1940 was 8,894,229. Of this amount the increase in urban places (5,468,879) accounted for 61.5% and that in rural areas (3,425,350) for 38.5%. On the basis of absolute numbers, then, the urban increase was substantially larger than the rural.

The marked decline in the rate of urban growth is attributable in large measure to the economic conditions of the past decades. These conditions have slowed down the movement of population from rural to urban areas, and have also reduced somewhat the rate of natural increase. Hence the urban areas have grown far less, in comparison with past decades, from the inflow of rural inhabitants, and somewhat less from the excess of births over deaths. Finally, immigration from foreign countries, which is at least partially related to economic conditions in the U.S., virtually ceased during the 1930s. In past decades such immigration has contributed greatly to urban growth; in the period from 1930 to 1940, during which net immigration was a minus quantity and gross immigration only a few hundred thousand, it is obvious that immigration could have contributed very little.

The urban and rural population figures from 1790 to 1940 are summarized in Table III and shown graphically in fig. 1, which incidentally, indicates also the growth of the total population over the 150 years covered by census data.

Table III.—Population of the United States Classified as Urban and Rural: 1790 to 1940

(Classified in accordance with method followed in 1930 and 1940; previously published figures for 1880 to 1920 revised accordingly)

Census year	Total population	Urban population		Rural population	
		Number	Per cent of total	Number	Per cent of total
1940	131,660,275	74,423,702	56.5	57,245,573	43.5
1930	122,775,046	68,954,823	56.2	53,820,223	43.8
1920	105,710,620	54,157,973	51.2	51,552,647	48.8
1910	91,072,266	41,908,932	45.7	49,973,334	54.3
1900	75,994,575	39,159,921	39.7	45,834,654	60.3
1890	62,047,714	22,106,265	35.1	40,841,449	64.9
1880	59,155,783	14,129,735	23.8	36,026,048	71.8
1870	38,558,371	9,902,301	25.7	28,656,070	74.3
1860	31,443,321	6,216,518	19.8	25,226,803	80.2
1850	23,191,876	3,543,716	15.3	19,648,160	84.7
1840	17,069,453	1,845,055	10.8	15,224,398	89.2
1830	12,866,020	1,127,247	8.8	11,738,773	91.2

1810	7,239,881	525,459	7.3	6,714,422	92.7
1800	5,308,483	322,371	6.1	4,986,112	93.9
1790	3,929,214	201,055	5.1	3,728,159	94.9

FIGURE 1—POPULATION OF THE UNITED STATES CLASSIFIED AS URBAN AND RURAL: 1790 TO 1940

The increase in the relative importance of the urban population during the first 30 or 40 years of the nation's history was very slow, as between 1790 and 1830 the percentage urban had increased only from 5.1 to 8.8. Beginning with 1850, however, the increase in the proportion of the population living in urban places was fairly rapid, running parallel with the increase in the relative importance of non-agricultural employment. This urban movement continued until 1930, but since 1930 the increase in city population has been relatively slow; and the smaller cities have grown somewhat more rapidly than those having a population of 100,000 or more.

Population by States.—The population is shown by geographic divisions and states for 1940 and 1930, with urban and rural data, in Table IV (see p. 140). The increase in population from 1930 to 1940 is also shown graphically on the accompanying map (fig. 2).

The District of Columbia, with an increase of 36.2%, grew faster between 1930 and 1940 than any of the states. The fastest growing state was Florida, with an increase of 29.2%, followed by New Mexico, with 25.6% and California, with 21.7%. Six states, namely, Kansas, Nebraska, North Dakota, Oklahoma, South Dakota and Vermont, lost population between 1930 and 1940. The first five of these states are located in the Great Plains and constitute a tier of states in the dust bowl extending from Canada to Texas. In no previous decade have more than three states lost population. In absolute amount, the increase of population in California was considerably greater than in any other state, being 1,230,136 as compared with 891,076 in New York, the next state in this respect. In ten other states, namely, Texas, Florida, Michigan, North Carolina, Tennessee, Pennsylvania, Illinois, Louisiana, Ohio and Virginia, increase in population between 1930 and 1940 exceeded 250,000.

Taking the states in large groups, it may be noted that all of the northern states, that is, the first four of the geographic divisions shown in Table IV, which had nearly 60% of the 1930 population,

show only about one-third of the increase between 1930 and 1940. The southern states, however, comprising the next three geographic divisions as shown in the table, which had less than 31% of the 1930 population, show nearly 43% of the increase; and the western states, comprising the Mountain and Pacific divisions, which had less than 10% of the 1930 population, show more than 22% of the increase.

It may be noted that practically all of the industrial states show a rate of increase less than the national average, and that even if the dust bowl states, with actual decreases in population, were omitted, the four northern divisions would still show a much smaller fraction of the increase than they had of the actual population either in 1930 or 1940. To some extent, the relatively more rapid rate of increase in the southern states is the result of their higher birth rates, coupled with the fact that, under present employment conditions, a much larger fraction of their population increase has probably remained within these states than in recent previous decades. The increase on the Pacific coast probably represents the continued settlement and development of new territory, since these states represent the last of the well watered lands to be occupied in continental United States. The especially rapid growth in California is presumably attributable also to the tendency of certain classes of the population to migrate toward areas of a warmer climate, this same tendency probably explaining also the rapid growth in Florida.

The very slight change in the urban-rural distribution of the population which has been indicated above for the country as a whole is the result of the averaging of conditions differing rather widely as between one part of the country and another. In general, the urban percentages have gone down in those regions and states where they were high, and have increased in those regions where they were low.

Specifically, in four of the geographic divisions, the New England, Middle Atlantic, East North Central and Pacific, the percentage of the population urban in 1940 was lower than in 1930, this resulting, of course, from a rural increase at a rate higher than the urban rate. In the Middle Atlantic division, for example, the rural population gained 9.0% and the urban only 3.7%, with the result that the percentage urban was reduced from 77.7 in 1930 to 76.8 in 1940. All except three of the states in these four divisions likewise show a lower percentage urban in

FIG. 2

138,439,069. Excluding the Philippine islands (for which only estimated figures are available), there were 134,265,231 persons in continental United States and the territories and possessions on April 1, 1940 as compared with 124,926,061 in 1930, an increase of 9,339,162, or 7.5%.

In contrast with continental United States, the territories and possessions as a group, not considering the Philippines, grew a little faster during the decade 1930-40 than they had in the previous ten years, gaining 20.7% as compared with 19.6%. In Alaska, American Samoa and Puerto Rico the rates of growth during the decade 1930-40 were above those for the period 1920-30. In Hawaii, on the other hand, population growth has decreased markedly since 1930 as compared with previous periods. In the decade 1930-40 the Hawaiian population increased by 14.9% as compared with 43.9% in the previous decade and 33.4% in the decade 1910-20. The population of Alaska decreased by 14.5% between 1910 and 1920, then increased by 7.7% during the following ten years, and increased 22.3% in the decade just ended. Puerto Rico, in contrast to Alaska, has shown considerably less change from one census to the next but nevertheless has grown more rapidly during each successive decade—16.3% in the period 1910-20, 18.8% in the period 1920-30 and 21.1% in the ten years 1930-40.

1940 than in 1930.

On the other hand, the percentage urban increased materially between 1930 and 1940 in the West North Central division, where several of the states show an actual loss of rural population, in conjunction with at least a moderate gain in urban areas; in the three southern divisions, where only three out of the 16 states form exceptions to the general rule; and in the Mountain division, where all the states share the increase in percentage urban, which, in some of the states with large total population increases, is considerable. In New Mexico, for example, the urban population increased 65.1% and the rural only 12.3, with a resulting change in the percentage urban from 25.2 in 1930 to 33.2 in 1940.

The population of the United States and all its territories and possessions, including the Philippines, in 1940, was 150,621,231, as indicated in Table V (see p. 141). This figure represents an increase of 12,182,162, or 8.8%, over the 1930 population of

the important functions—perhaps still the most important single function—which the census serves is that of providing a basis for the reapportionment of representation in the house of representatives. Such a reapportionment has been made by Congress following each census except that of 1920. In the law providing for the census of 1930 (under which the 1940 census also was taken) provision is made that, if Congress does not act within a specified time, reapportionment on the basis of the new census goes into effect without specific legislation. This law requires that the President submit to Congress at the first session subsequent to the decennial census a statement showing the new population of each state and the number of representatives to which each state would be entitled on the basis of these figures, (a) under the method of apportionment last used, (b) under the method known as "major fractions," and (c) under the method known as "equal proportions." Since the method last used was that of major fractions, this means that for 1940 the apportionment need be worked

Table V.—Population of the United States and Its Territories and Possessions: 1940

Area	Population		Increase	
	1940	1930	Amount	Per cent
United States and all territories and possessions	150,621,231	138,439,069	12,182,162	8.8
United States and territories and possessions, excluding Philippine islands	134,265,231	124,926,069	9,339,162	7.5
Continental United States	131,669,275	122,775,046	8,894,229	7.2
Territories and possessions, excluding Philippine islands	2,595,956	2,151,023	444,933	20.7
Alaska	*72,524	*59,278	13,246	22.3
American Samoa	12,908	10,055	2,853	28.4
Guam	22,290	18,509	3,781	20.4
Hawaii	423,330	368,336	54,994	14.9
Panama Canal Zone	51,827	30,467	12,360	31.3
Puerto Rico	1,869,255	1,543,913	325,342	21.1
Virgin islands	24,889	22,012	2,877	13.1
Military and naval services, etc., abroad	118,933	89,453	29,480	33.0
Philippine islands	†16,350,000	†13,513,000	2,837,000	21.0

*Census taken as of Oct. 1 of the preceding year.

†Estimate derived by extrapolation from the census figures for 1918 (10,314,310) and 1939 (16,000,303).

‡Estimate derived by interpolation from the census figures for 1918 and 1939.

but by only two methods—the two methods specifically mentioned above. Under the method of major fractions the state of California gains three representatives, and seven other states, namely, Arizona, Florida, Michigan, New Mexico, North Carolina, Oregon and Tennessee each gain one. To balance these gains, since the number of representatives in the house is not to be changed, the following ten states each lose one representative, namely, Arkansas, Illinois, Indiana, Iowa, Kansas, Massachusetts, Nebraska, Ohio, Oklahoma and Pennsylvania. The apportionment under the method of equal proportions differs in only one respect from that just outlined, namely, that Michigan and Arkansas keep their present numbers of representatives instead of gaining one and losing one, respectively. See table of Apportionments, p. 144A.

Individual Cities.—According to the returns of the 1940 census there were 92 cities in the United States having 100,000 inhabitants or more, the total population of these cities being 37,879,899. These 92 cities had a population of 36,195,171 persons in 1930, showing an increase of 1,792,818 during the decade. This change represents an increase in population of 5.0% between 1930 and 1940, as compared with 23.7% for the same cities between 1920 and 1930. It is evident from these figures that the larger cities have been growing much less rapidly since 1930 than during the preceding decade.

The number of cities with a population of 100,000 or more was one less in 1940 than in 1930—92 as compared with 93. Sacramento, Calif. and Charlotte, N.C., were newcomers to the list, while El Paso, Tex., Lynn, Mass. and Evansville, Ind. dropped below 100,000 between 1930 and 1940.

The population of the 93 cities which had a population of 100,000 or more in 1930 was 36,325,736. As compared with this figure, the population of the 92 cities of 100,000 or more in 1940 represents an increase of 4.6%, the lower percentage (as compared with the 5.0% given above for identical cities) being the result of the net loss of one city from the group.

Twenty-eight of the cities lost population between 1930 and 1940, as compared with only four of the same cities between 1920 and 1930. Three cities, Fall River and Lowell, Mass. and Wilmington, Del., reversed declines observed between 1920 and 1930 and showed slight increases in the last decade. Only one city, Washington, D.C., grew more rapidly between 1930 and 1940 than between 1920 and 1930.

The most rapid growth between 1930 and 1940 occurred in Miami, Fla., which increased by 55.6%. San Diego, Calif. (37.4%), and Washington, D.C. (36.2%), were second and third respectively. It may be noted that no city in the New England

Table VI.—Population of Cities of 100,000 or More, Arranged According to Size: 1940 and 1930

(A minus sign [—] denotes decrease)

*Less than 0.1%.

or Middle Atlantic division shows an increase of more than 10%.

The population of all cities and other urban places (villages, towns, boroughs, etc.) of 5,000 or more, arranged alphabetically by states, is shown, for 1940 and 1930, in Table XVII at the end of this article.

Farm Population.—The farm population, as it has been shown in the population census reports, comprises all persons living on farms, without regard to occupation. Since only about 1% of the entire farm population is found in urban areas, the statistics of the urban-farm population have been limited to a simple count of its number. The rural-farm population (comprising about 99% of the total farm population) has been set up, however, as a subdivision of the rural total and statistics are shown under most of the census classifications for three groups based on residence, namely, urban, rural-nonfarm and rural-farm. The statistics for these three groups, and also for the total farm population and the urban-farm population, are summarized for the last three censuses in Table VII.

Table VII.—*Farm Population, Rural-Nonfarm, and Rural-Farm: 1920 to 1940*
(The 1940 farm-nonfarm classification is based on a 5% sample of the census returns)

Item	1940	1930	1920	Per cent of increase	
				1930-40	1920-30
Total population	131,669,275	122,775,046	105,710,620	7.2	16.1
Rural population	57,245,573	53,820,223	51,406,017	6.4	4.7
Per cent of total	43.5	43.8	48.6	..	..
Rural-nonfarm population	27,094,497	23,662,710	20,047,377	14.5	18.0
Per cent of total	20.6	19.3	19.0	..	..
Per cent of rural	47.3	44.0	39.0	..	..
Rural-farm population	30,151,076	30,157,513	31,358,640	*	-3.8
Per cent of total	22.9	24.6	29.7	..	..
Per cent of rural	52.7	56.0	61.0	..	..
Total farm population	30,475,206	30,445,350	31,614,269	*	-3.7
Rural-farm	30,151,076	30,157,513	31,358,640	*	-3.8
Urban-farm	324,130	287,837	255,629	..	12.6

*Decrease of less than 0.1%.

The total farm population in 1940 was 30,475,206, representing a slight increase over the 1930 figure, which was 30,445,350. During the same period there was a decrease of about 3% in the number of farms, so that the average number of persons per farm may be assumed to have increased a little.

The urban-farm population consists rather largely of persons living on farms situated in the urban towns of New England and in other urban places where the incorporated area includes considerable areas of undeveloped land. While the figure involved is too small to be of great significance, it may be noted that the entire increase in farm population is the result of increase in this urban-farm group, since the rural-farm population shows a slight decrease. This means that all of the increase in the rural population between 1930 and 1940 was due to the growth of the rural-nonfarm group (made up of persons living in unincorporated towns, incorporated places of less than 2,500, and in nonfarm areas in the open country), which increased 14.5% between 1930 and 1940.

Sex Distribution.—The sex ratio (the number of males per 100 females) had fallen to 101.1 in 1940, as compared with 102.5 in 1930 and appreciably higher figures in most of the earlier censuses. In absolute figures, the number of males exceeded the number of females in 1940 by 697,051, as compared with an

excess of 1,499,114 in 1930 and a maximum of 2,692,288 in 1910. The population data classified by sex are shown in Table VIII.

The excess of males in the population of the United States has been due mainly to two factors: first, to the very considerable excess of males over females in the immigration from foreign countries; and second, to the fact that from 105 to 100 male infants are born for every 100 female. The effect of this last differential gradually disappears with increasing age, since the death rate among males is appreciably higher. The general decline in the sex ratio is, therefore, partly explained by the aging of the population and partly by the decrease in the extent of immigration, while the increase shown for certain census dates notably 1910, is the result of periods of extensive immigration.

The sex distribution differs materially as between the urban population and the two rural groups, as indicated by the figures in Table IX. In 1940 the sex ratio in the urban population was 95.8, in the rural-nonfarm 104.2, and in the rural-farm 112.1, the urban and rural-nonfarm figures being appreciably lower than in 1930 and the rural-farm somewhat higher.

Table IX.—*Urban, Rural-Farm, and Rural-Nonfarm Population of the United States, by Sex: 1940 and 1930*

(The 1940 figures are based on a 5% sample of the census returns)

	Number			Per cent			Males per 100 females
	Total	Male	Female	Total	Male	Female	
1940							
United States	131,669,275	66,183,163	65,486,112	100.0	100.0	100.0	101.1
Urban	74,423,702	36,420,441	38,003,261	56.5	55.0	58.0	95.8
Rural-nonfarm	27,094,497	13,820,477	13,268,218	20.6	20.9	20.3	104.2
Rural-farm	30,151,076	15,939,243	14,214,633	22.9	24.1	21.7	112.1
1930							
United States	122,775,046	62,137,080	60,637,966	100.0	100.0	100.0	102.5
Urban	68,954,823	34,154,760	34,800,063	56.2	55.0	57.4	98.1
Rural-nonfarm	23,662,710	12,117,945	11,544,765	19.3	19.5	19.0	105.0
Rural-farm	30,157,513	15,864,375	14,293,138	24.6	25.5	23.6	111.0

One of the main reasons why the number of males per 100 females in the farm population is so much higher than in the urban is that the farms provide employment for large number of men but relatively few women, for which reason the young women from the farm areas migrate to the cities, where they find employment in the factories and in clerical occupations. The same relationship appears in the figures indicating the percentage distribution of the male and female population, respectively, among the urban-rural groups—58.0% of the females being urban, as compared with 55.0% of the males.

Age Composition.—The average age of U.S. population is steadily increasing. In 1940 the median age for the entire population, all classes and both sexes combined, was 28.9 years. (The median age is that age which divides the population into two equal groups, one-half being older and one-half younger, than the median.) The median age for 1930 was 26.4 years, and for 1820, the earliest date for which an age distribution for the entire population is available, it was 16.7 years. The average age of the population has thus been rising steadily during the course of U.S. history.

Table VIII.—*Population of the United States by Sex: 1820 to 1940*

Census year	Total	Male	Female	Males per 100 females	Excess of males
1940	131,669,275	66,183,163	65,486,112	101.1	697,051
1930	122,775,046	62,137,080	60,637,966	102.5	1,499,114
1920	105,710,620	53,900,431	51,810,189	104.0	2,090,242
1910	91,972,266	47,332,277	44,639,989	106.0	2,692,288
1900	75,094,575	38,816,448	37,178,127	104.4	1,638,321
1890	62,047,714	32,237,101	30,710,613	105.0	1,526,488
1880	50,155,783	25,518,820	24,636,963	103.6	881,857
1870	38,558,371	19,493,505	19,064,866	102.2	428,759
1860	31,443,321	16,085,204	15,358,117	104.7	727,087
1850	23,191,876	11,837,660	11,354,216	104.3	483,444
1840	17,069,453	8,688,532	8,380,921	103.7	307,611
1830	12,860,020	6,532,489	6,327,531	103.1	204,958
1820	9,938,453	4,896,605	4,741,848	103.3	154,757

Table X.—*Population of the United States by Age: 1940 and 1930*

(The 1940 figures are based on a 5% sample of the census returns)

Age (years)	Number		Per cent distribution	
	1940	1930	1940	1930

65 and over	8,950,206	6,633,805	6.8	5.4

*Includes 94,022 persons of unknown age.

The age distribution of the population in 1940 and 1930 is given in Table X, while Table XI summarizes the figures into cumulative groups.

Table XI.—Population of the United States in Cumulative Age Groups: 1940 and 1930

(The 1940 figures are based on a 5% sample of the census returns)

Age	Number		Per cent	
	1940	1930	1940	1930
Total	131,660,275	122,775,046	100.0	100.0
Under 5 years	10,597,891	11,444,390	8.0	9.3
Under 10 years	21,323,764	24,951,990	16.2	19.6
Under 14 years	30,097,079	33,974,491	23.3	27.4
Under 20 years	45,461,170	47,608,991	34.5	38.8
Under 25 years	57,022,712	58,479,390	43.3	47.6
Over 25 years	74,646,563	64,201,655	56.7	52.3
Over 45 years	34,903,261	28,048,786	26.5	22.8
Over 65 years	8,956,206	6,633,805	6.8	5.4

A notable effect of this "aging" of the population has been the great increase in the number of elderly persons since 1930. In 1940 there were 8,956,206 persons 65 years old or over, an increase of 35% over the 6,633,805 reported in 1930. In 1940 34.5% of the population was under 20 years of age, 39.0% was 20 to 44 years of age, 19.7% was 45 to 64 years of age, and 6.8% was 65 years of age and over. In 1930 the younger age groups were relatively more populous—38.8% were under 20, 38.3% were between 20 and 44, 17.4% were 45 to 64 and only 5.4% were 65 or over.

The increasing numerical importance of the age group 65 years and over in the population can be seen most readily by computing the number of persons 65 years of age and over per 100 persons between the ages of 20 and 64. In 1930 there were only 10 such elderly persons to every 100 in the younger age group; in 1940 there were 12.

Colour Classification.—The proportions of whites and nonwhites remained substantially unchanged between the last two censuses; 89.8% of the population was classified as white (including Mexicans) and 10.2% was returned as nonwhite.

The white population as a whole increased 7.2% between 1930 and 1940, and the nonwhite population increased 7.7%. When these two classes are analyzed by urban and rural residence, however, marked differences in the pattern of growth become apparent. Whereas the urban white population increased 6.9%, the urban nonwhite population increased 19.6%, or nearly one-fifth.

The rural white population as a whole increased 7.5%, but the rural nonwhite population actually decreased by 1.3%. In rural-nonfarm areas the white population increased by 15.5%, but the nonwhite population had a growth of only 4.8%. In farm areas the white population increased very slightly (0.7%), and the coloured (nonwhite) showed a 3.9% decrease.

Employment Status.—Provision was made in the 1940 census for classifying all persons 14 years old and over according to their status in the labour force, or their relation to the labour force, during the week of March 24–30, 1940, this representing a considerable change from the practice in earlier censuses, in which all

persons who reported that they usually followed a gainful occupation were counted as gainful workers. A summary of this classification, based on a preliminary tabulation of a 5% cross-section of the census returns, is presented in Table XII.

According to these figures there were 100,972,196 persons 14 years old and over, of whom 52,840,762 were in the labour force. The labour force included three main groups: 45,350,430 persons who were at work on private or nonemergency government work, or who had jobs from which they were temporarily absent; 2,380,062 persons who were on public emergency projects (WPA, NYA, CCC, etc.); and 5,110,270 who were seeking work and who were without any form of public or private employment. Because of difficulties peculiar to the enumeration of public emergency workers, the employment status of a considerable number of such workers was improperly classified. The emergency agencies reported a total of approximately 2,906,000 persons on their rolls at about the time of the census week, not including 472,000 persons on the NYA student work program.

The percentage distribution of the persons in the labour force among the various categories shown in the classification is given in Table XIII.

Table XIII.—Per Cent Distribution by Employment Status of Persons 14 Years of Age and Over in the Labour Force, by Sex, for the United States: March 24–30, 1940

(Figures are based on a preliminary tabulation of a 5% sample of the census returns)

Employment status	Total	Male	Female
Total in the labour force	100.0	100.0	100.0
Employed (except on public emergency work)	85.8	85.5	86.8
At work	83.4	83.1	84.1
With a job	2.5	2.4	2.7
On public emergency work (WPA, NYA and CCC)	4.5	4.9	3.4
Seeking work	9.7	9.6	9.9
Experienced workers	8.2	8.4	7.4
New workers	1.5	1.2	2.4

The 48,131,434 persons not in the labour force represented 47.7% of the total population 14 years old and over and included 28,838,484 persons engaged in home housework, 9,070,986 persons attending school, 5,220,098 persons unable to work, 1,226,374 inmates of institutions, 1,986,348 persons not working or seeking work for other reasons, and 1,789,144 persons whose employment status during the census week could not be determined. Preliminary data on the sex, age and residence of these persons indicate

Table XII.—Employment Status of Persons 14 Years of Age and Over, by Sex, in the United States: March 24–30, 1940

(Figures are based on a preliminary tabulation of a 5% sample of the census returns)

Employment status	Total	Male	Female	Per cent distribution		
				Total	Male	Female

In institutions ⁶	1,226,374	795,610	430,764	1.2	1.6	0.9
Other	1,986,348	1,211,330	775,018	2.0	2.4	1.5
Unknown ⁷	1,789,144	757,684	1,031,460	1.8	1.5	2.0

¹Persons who worked for pay or profit (except on public emergency work), or assisted without pay in a family enterprise, at any time during the week of March 24–30, 1940.

²Persons who had jobs (except on public emergency work), businesses or professional enterprises at which they did not work during the week of March 24–30, 1940, because of temporary illness, vacation, industrial dispute, bad weather or layoff not exceeding 4 weeks with instructions to return by a specific date.

³The number of persons reported in the census as on public emergency work was considerably below the number indicated by the records of the various emergency work agencies. It is probable that the majority of such workers who were not properly classified were returned as employed on private or nonemergency government work.

⁴Persons not at private or nonemergency government work, nor on public emergency work, who were seeking work during the week of March 24–30, 1940.

⁵Persons seeking work who had not previously worked full time for one month or more at a single job.

⁶Inmates of penal institutions, hospitals for the mentally diseased or defective, and homes for the aged, infirm and needy.

⁷Includes some persons whose activity during the week of March 24–30, 1940, could not be definitely determined. It is believed that the majority of these were not in the labour force.

that the great majority were probably not in the labour force:

The proportions of the total labour force seeking work and without any form of public or private employment varied somewhat in different segments of the population. The proportions were roughly similar for men and women, being 9.6% and 9.9%, respectively. The proportion seeking work in the white population was 9.5%, as compared with 10.9% for the nonwhite. Differences were especially large in terms of age. Of the 5,110,270 persons seeking work, about two-fifths were youths from 14 to 24 years of age, although this age group comprised but slightly more than one-fifth of the total labour force. These figures do not include persons on public emergency work, who are usually counted as part of the unemployed, and hence provide only an approximation of the differentials in unemployment rates.

The proportion of the population 14 years old and over in the labour force varied considerably by sex, age, colour and as between urban and rural areas, as indicated by the figures in Table XIV. The proportions of males and females 14 years old and over in the labour force were 79.0% and 25.5%, respectively. For both sexes the proportion in the labour force was low in the age group 14-19 years; it was considerably higher in the next two age groups (20-24 years and 25-44 years) and was somewhat lower for persons in the 45-64 year group. The proportion in the labour force was lowest for persons 65 years old and over. Colour differences were significant in that 51.7% of all white persons and 58.4% of all nonwhite persons 14 years old and over were in the labour force; the difference was due largely to the much higher proportion of nonwhite females who were workers. There was no age class in which the majority of women 14 years old and over were in the labour force. However, the great majority of men from 20 to 64 years of age were in the labour force. The labour force represented 54.7% of all persons over 14 years of age in urban areas, as compared with 48.4% in rural-nonfarm and 49.4% in rural-farm areas.

The labour-force concept underlying the 1940 data on employment and unemployment is not strictly comparable with the gainful-worker concept of previous censuses. The 1940 definition was based on the activity of the person during a given week while the 1930 figure for "gainful workers" included all those persons usually following a gainful occupation, regardless of whether they were working or seeking work at the time of the census. It is possible that certain classes of persons, such as retired workers, some inmates of institutions, recently incapacitated workers, and seasonal workers neither working nor seeking work at the time of the census, were frequently included among gainful workers in 1930, but, in general, not in the 1940 labour force. On the other hand, the 1940 census included in the labour force persons seeking work without previous work experience, that is, new workers, few of whom were included in the 1930 gainful-

Table XV.—Number of Dwelling Units, Occupied and Vacant, in Urban and Rural Areas of the United States: 1940, with 1930 Family Data

Item	Total	In urban places		In rural territory

*Semifinal figures, subject to possible slight change.

†Mainly vacant dwelling units (largely seasonal) held for absent households, together with a few dwelling units occupied by nonresident households.

worker group.

Housing Data.—The census of housing was taken at the same time as the census of population and by the same enumerators who obtained information on both the population schedule and the housing schedule at the same visit to each place of residence. The main purpose of the housing inquiries was to obtain detailed information about the living quarters occupied by the population of the United States. From the housing census were obtained also a number of fundamentally important items which have previously been obtained on the population schedule, such as tenure and value or rent of home, and size of family or household. The two schedules, population and housing, are being tabulated in close conjunction, with correlation of items from both in several of the tabulations. Certain new designations have been made necessary by the added detail called for in this census. A dwelling unit as the term is here used, is the living quarters occupied by one family or household. In an apartment house there are, therefore, as many dwelling units as there are separate apartments.

The more significant of the available housing items are summarized in Table XV, which gives the figures for urban and rural areas as well as for the United States as a whole, together with some significant data for 1930.

Of the 37,336,890 dwelling units reported in the entire country, 1,884,016, or 5.0%, were returned as vacant and for sale or rent while 591,249 were returned as vacant (or at least not occupied by regularly enumerated census families) and not for sale or rent. This last group was made up rather largely of seasonal dwelling units, such as summer homes held for later occupancy by households not living in them at the time of the census.

The percentage of dwelling units vacant and on the market in urban areas was only 4.3, as compared with 6.1 in rural areas.

The dwelling units reported include both seasonal and ordinary units, and the larger percentage vacant in rural territory is explained in part by the large number of seasonal units in rural areas.

The number of occupied dwelling units represents approximately the number of private households in the respective areas and may therefore be compared roughly with the number of private families shown in the census reports for 1930. Such a comparison shows

Table XIV.—Persons 14 Years of Age and Over in the Labour Force in the U.S. by Sex and Colour, by Sex and Age, and by Sex for Urban and Rural Areas: 1940

(Figures are based on a preliminary tabulation of a 5% sample of the census returns)

Colour, age and area	Population 14 years of age and over			Persons in the labour force					
	Total	Male	Female	Number			Per cent of population 14 and over

Rural-farm	21,292,664	11,422,200	9,870,374	10,508,514	9,250,268	1,258,246	49.4	81.0	12.7

that the number of private households increased approximately 16.6%. This increase is considerably more than the 7.2% increase shown in population in the United States between 1930 and 1940. The average population per occupied dwelling unit in 1940 was 3.8 for the United States as a whole, as compared with an average population per family of 4.1 in 1930. More than half of the increase in number of families in the decade is thus due to a decline in family size and less than half to population increase.

The decline in the average population per family from 4.1 in 1930 to 3.8 in 1940 indicates the continuation, at an accelerated rate, of the downward trend in family size which is shown by the following averages from earlier censuses: 4.9 in 1890, 4.7 in 1900, 4.5 in 1910 and 4.3 in 1920. The average population per family, which had been decreasing at the rate of two-tenths of a person per decade since 1890, as indicated by these figures, decreased three-tenths of a person, or half as much again, between 1930 and 1940; or, making the comparison directly with 1890, the average population per family in 1940 is less by 1.1 persons than it was 50 years ago. The decline in the average size

*Semifinal figures, subject to possible slight change.
†Average population per occupied dwelling unit for 1940; average population per private family for 1930. These two averages are roughly equivalent and comparable.

of the family in the United States is due primarily to increased urbanization and the decline in the birth rate.

The data relative to size of family for 1940 and 1930 are presented by states in Table XVI.

Among the geographic divisions, the average 1940 population per occupied dwelling unit ranged from 3.2 in the Pacific division to 4.2 in the South Atlantic division. In only two divisions was the average four persons or more in 1940, whereas all but one division had averages of four persons or more in 1930.

Among the states, the range in the average population per occupied dwelling unit was from 3.2 in Washington, Oregon and California, to 4.5 in North Carolina. Eleven other states, nine of them in the south, had averages of four persons or more, while no state outside the far west showed an average less than 3.5.

The decrease in the average population per family was shared rather uniformly by all of the states, the difference in most cases being either three-tenths or four-tenths of a unit.

1940 Census Reports.—The 1940 count of total population was (Feb. 1941) available either in printed form or in processed releases, for all states, counties, cities, towns, villages (incorporated), and other political subdivisions of the country, and the counts of housing units are likewise available for states, counties and incorporated places of 2,500 or more. Data were available from the preliminary tabulation of the 5% sample on the following subjects: employment status; sex, colour, age and farm-nonfarm residence. The simpler tabulations of this series provide figures for states and large cities, and the more complex cross-tabulations, for the United States as a whole or for large subdivisions.

Complete tabulations for population and housing units, classified in accordance with the more important characteristics (and available for small areas), were to be made public, state by state, through the summer of 1941, with many series completed by early fall. The volume summarizing the population counts was scheduled to be issued in the summer of 1941, but other volumes of the final reports would probably not be forthcoming much before the end of 1941. (See also MUNICIPAL GOVERNMENT.)

(L. E. T.)

Centennials: see CALENDAR, 1941, page xx.

Central America, the region between Mexico and Colombia, embracing the republics of Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, Panama, the Panama Canal Zone and the colony of British Honduras. The area is approximately 222,674 sq.mi.; the population approximately 8,356,000 in 1940, is concentrated on the highland plateau adjacent to the Pacific, where from being over 65% Indian in Guatemala, it becomes predominantly mestizo in the middle republics and largely white in Costa Rica. Panama includes a large Negro element of West Indian extraction, while the low Caribbean slope and British Honduras are chiefly negroid. In the republics, government is in practice by dictators, with the outstanding exception of Costa Rica. Dictatorship, however, is of a more enlightened variety than formerly, except in Panama.

The Central American republics were active in inter-American defence efforts during 1940, and participated in the Havana conference despite strong German diplomatic pressure. Politically, the greatest internal problem of the year was suppression of fifth-columnism. Economically, the pinch of European war trade disruption was keenly felt, but the Inter-American Coffee Quota agreement of Nov. 1940, with its promise of coffee price stabilization, and financial aid from the United States materially lessened the tension.

External communication is by sea and by Pan American Airways and Central American Air Transport. Communication between countries is generally poor. Internal communication is by rail, air and highway, and is best developed in El Salvador. Construction of several important links of the Inter-American highway was begun during 1940.

In 1939, Central American imports totalled approximately \$89,046,000, and exports \$66,214,000, representing increases of 19% and 6% over 1938. Around 50% of all exports went to the United States, which supplied roughly 70% of imports. The United States' share of the foreign trade increased sharply in 1940. Imports are largely foodstuffs, textiles, machinery and other manufactured goods. Coffee from the Pacific uplands and bananas from the lowlands are chief export commodities of most of the republics, with chicle, hemp and logwood the main exports of British Honduras. Gold-mining is of increasing importance, especially in Nicaragua. Corn and beans are grown extensively for domestic consumption. The tourist trade is rapidly expanding in most regions. Education and literacy vary from country to country, with Costa Rica the most advanced. (See BRITISH HONDURAS; COSTA RICA; GUATEMALA; HISPANIC AMERICA AND THE EUROPEAN WAR; HONDURAS; NICARAGUA; PANAMA; PANAMA CANAL AND CANAL ZONE; SALVADOR, EL.) (L. W. BE.)

Ceramics: see FELDSPAR; GYPSUM.

Cereals. World supplies of the principal bread grain, wheat, stood at record levels in 1940, wartime restrictions on shipments causing scarcity in some countries and unusable surpluses in other countries. Rice, the principal food grain of the orient, presented a similar picture, with pronounced scarcities in Japan and parts of China and mounting surpluses in various producing countries. World production of wheat in the 1940-41 crop year was 6,100,000,000bu. compared to 6,200,000,000bu. in 1939-40 and a five-year (1933-34 to 1937-38) average of 5,500,000,000 bushels. The world acreage of wheat in 1940-41 was 406,600,000ac. compared with 412,600,000ac. in 1939-40 and a five-year average of 397,200,000 acres. The foregoing figures are from the Office of Foreign Agricultural Relations, United States department of agriculture, with incomplete official data supplied

by approximations and with Russian and Chinese production conjectural. Although production in 1940 was slightly under 1939 the large carry-over of about 1,600,000,000bu. resulted in a record. Wheat also is the outstanding example of the greatest change in world-wide agriculture since 1920, practically all wheat-growing countries having greatly expanded production in that time. A large acreage was reported to have been sown to wheat in Europe and the United Kingdom in the autumn of 1940. Official restrictions on agricultural statistics in a number of countries prevent comprehensive reports on production of various food and feed grains, but the International Institute of Agriculture, Rome, gave the acreages planted to rye, barley and oats in various countries in 1940, in 1939 and for the five-year (1934-38) average as shown in the table.

Rye, Barley and Oat Acreage in Certain Countries, 1940, 1939 and Average

While the supply of feed grains was inadequate in Europe and in the United Kingdom in 1940, the supply in the United States, in comparison with the numbers of livestock to be fed, was the largest on record, chiefly because of the extraordinary carry-over of corn. The corn supply in Argentina also was so large that the grain was used for fuel and experiments were made in an effort to find a market through the manufacture of alcohol. Corn yields in the United States have been increased enormously through the introduction of hybrid varieties, while new varieties of disease-resistant wheat and oats tend to increase acre yields. (For more specific details on cereals see WHEAT, RICE, RYE, BARLEY and OATS.) (S. O. R.)

Ceylon. A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area 25,332sq.mi.; pop. (est. Dec. 31, 1938) 5,864,000. Chief towns (pop. census 1931): Colombo (cap., 284,115); Jaffna (45,708); Galle (34,424); Kandy (37,147). Governor, Sir Andrew Caldecott, K.C.M.G.; languages, English, Sinhalese, Tamil; religions, Buddhism and Hinduism the chief.

History.—Ceylon moved toward prosperity in 1939, the visible balance of trade rising from the low level of Rs. 49,000,000 in

1938 to nearly 61,800,000. Difficulties arising from the constitutional position continued, especially in connection with the enfranchisement of immigrant daily-paid labourers from India with no stake in the country. These difficulties led to a request in June 1940 for the appointment of a royal commission of enquiry and were a deciding factor in the postponement (July) for two years of the elections scheduled for Jan. 1941. Labour unrest and communistic agitation also caused trouble, but were not allowed to interfere with the island's contribution to the imperial war effort—this including not only the gift of large sums of money to the various war funds as well as great value in commodities, but also a volunteer corps for air service in any part of the empire and an air base for the royal air force.

Industrial progress was well maintained; food production on a large scale was fostered by subsidy; state rubber, quinine, acetic acid, plywood and other factories were inaugurated; researches for the development of cotton growing and the marine fisheries were instituted and valuable deposits of iron ore found. Progress was made with the civil engineering portion of the Watawala hydroelectric scheme and a labour-training centre for 600 Sinhalese men and women was opened. Serious floods, causing damage to the extent of Rs. 3,000,000, gave an impetus to the various irrigation works recently started to assist agriculture.

On the social side progress was made with the architectural planning of the new Ceylon university at Paradeniya, a suburb of Kandy; a training college for Muslim teachers was founded at Alutgama; and the island's first "Borstal" was opened at Watupitawela.

Education.—In 1939: schools, 6,100, including 336 English schools, 74 bilingual, 3,723 Sinhalese and Tamil (820 estate and 780 unaided); scholars: boys 502,917, girls 325,173.

Banking and Finance.—Revenue (1938-39) Rs. 116,928,463; (est. 1939-40) Rs. 123,484,600; expenditure (1938-39) Rs. 127,050,757; (est. 1939-40) Rs. 129,504,965; public debt (Sept. 30, 1938) Rs. 194,191,333; currency: Rs. 1=100 cents=1s.6d.

Trade and Communication.—Overseas trade, merchandise, 1939: imports Rs. 242,369,560; exports (domestic) Rs. 304,161,745; re-exports Rs. 22,726,262; exports of tea totalled 228,540,000 lb. (value Rs. 188,000,000) as against 235,670,000 in 1938 (value Rs. 172,400,000). Communications and transport 1938: roads, main surfaced 4,485 mi.; railways (117 mi. narrow gauge), total 960 mi.; shipping, entered 1938, 13,228,439 net tons; motor vehicles licensed (Dec. 31, 1939), 21,014 motor cars and taxis; 4,408 lorries and vans; 2,574 omnibuses; 2,906 cycles; 52 tractors; 210 trailers; wireless receiving set licences (Dec. 31, 1937), 4,911; telephone instruments in use (1938), 10,424.

Agriculture.—Production, 1938 (exports), in metric tons: copra (including coco-nut oil), 197,800; tea, 106,900; rubber, 60,000.

Chain Stores. The sales volumes of the corporate chain store for the first eleven months of 1940 and for the first two weeks in December show that during 1940 the corporate chain maintained its competitive position in retailing and in some cases improved it. Sales for the year were about 10% ahead of 1939 in the food field, 6% ahead in the drug field and 5% ahead in the variety store field. Reliable estimates indicated that the grocery chains accounted for better than 40% of the total grocery volume while operating fewer stores than at any time since 1930, and that the drug chains accounted for about 25% of the total drug store volume while operating less than 10% of the total number of drug stores. Volume gains were general among practically all types of corporate chains and were widespread geographically. Net profits, for the most part, were better than expected in view of increased operating costs and higher taxes.

From the point of view of the corporate chain, the most significant development of 1940 on the legislative front was the public hearing on H.R. 1, the so-called Patman "death sentence" anti-chain tax measure. Frankly designed through its drastic and graduated excise tax provisions to cripple or destroy every corporate chain operating numerous units in many states, to damage every corporate chain operating a few stores in each of many states, and to affect harmfully every corporate chain operating numerous units in one state, this bill was introduced in 1938 by Representative Patman as H.R. 9464. In 1939 it became H.R. 1 and continued to be lodged in the ways and means committee of the house. At the insistence of its sponsor, public hearings were granted to H.R. 1 and were conducted before a seven-man subcommittee from March 27 through May 16, 1940. The case for the bill was presented by a small group of 26 proponent witnesses, almost all of whom were either wholesalers or retailers or their spokesmen. In contrast, the bill was opposed by 162 witnesses from 35 states representing important groups from the fields of agriculture, labour, real-estate ownership, home economics and the federal departments of agriculture and of commerce. As a result of the mass of testimony condemning the principle of the bill and affirming the economic and social value of the corporate chain system of retailing, the house subcommittee, on June 18, defeated a motion to report the bill favourably to the ways and means committee and adjourned *sine die*, but made available a printed record of 2,257 pages of testimony.

During 1940, 10 discriminatory chain tax measures were sponsored in four state legislatures and in the District of Columbia. However, 1940 maintained the record of the previous two years and no new state was added to the list of 20 that since 1937 have had anti-chain store tax laws on their statute books. Two states, Kentucky and Mississippi, passed new chain tax measures superseding previous impositions. Both were of the so-called "Louisiana type." Kentucky's 1940 law is that commonwealth's fourth attempt to place on its statute books a law which will be acceptable to its highest court, inasmuch as three previous anti-chain measures have been invalidated. On March 25, the supreme court of the United States remanded to the supreme court of Minnesota for review the state court's decision in the so-called National Tea company case and on Sept. 27 the state supreme court again held unconstitutional the graduated gross receipts tax provisions of the 1933 Minnesota Chain Store Tax law. In 1940, as in 1939, court decisions tended to consider economic as well as legalistic grounds and to hold anti-chain tax measures unwarrantably discriminatory in their economic basis.

As of Dec. 1, 1940, 28 municipalities in the United States—all but one (Portland, Ore.) located south of the Mason and Dixon line—had punitive chain store tax ordinances in force. Nine of the 28 municipalities passed these ordinances in 1940. Such ordinances, however, continued to meet with court rebuffs. Early in the year, the Georgia supreme court invalidated the Augusta, Ga., chain tax ordinance. On Aug. 27, for the second time within two years, the Columbus, Ga., ordinance was held to be "confiscatory, discriminatory, arbitrary and therefore unreasonable" by the Georgia courts.

The year 1940 also indicated a further judicial trend toward the application of operative chain store tax provisions to "voluntary" and "co-operative" chains. On June 12, the 3rd Judicial district court of Idaho held that individually owned stores associated in a voluntary group are subject to the Idaho chain store tax. On May 9, the South Dakota circuit court also held that individually incorporated stores subject to common direction in buying and other phases of management and operation are taxable under that state's chain store statute. And while the anti-chain store tax law of Texas exempts filling stations, the Texas

court of civil appeals, late in 1940, held that a chain of Texas filling stations was subject to such taxes because a number of general merchandise items were being sold in addition to the petroleum products.

In part, at least, because of this extension of chain tax laws to "voluntaries," one large oil company announced its decision to resume the operation of company-owned service stations. Indications were growing that there would be a continued movement away from the "Iowa plan," so-called because the Standard Oil Company of Indiana began to organize its Iowa filling stations on a "voluntary" basis in 1935, immediately after that state passed a corporate chain tax measure that hit directly at company-owned filling stations.

The corporate chain continued to establish supermarkets and large self-service units and to close small, unprofitable units. Twenty-six of the largest corporate chains operated about 7% fewer units in 1940 than in 1939.

In 1940 the ratio of independents to corporate store units was about 9 to 1 as against a ratio of 5 to 1 in 1929. In September the Super-market institute announced that approximately 7,500 supermarkets were in existence, representing an increase of about 40% over Sept. 1939.

During the year, the food chains sharply increased the use of the self-service principle in their produce departments. They continued to "dress-up" the self-service idea and spent about \$29,300,000 on store construction and modernization as compared with a total of about \$28,000,000 in 1939. For all corporate chains, such expenditures increased about 3.2% over the construction and modernization figures for 1939.

The corporate chains, particularly in the food field, continued to expand their lines with a resulting slowing down in the rate of stock turnover. However, volumes were maintained and increased in part, at least, by the energetic development and promotion of chain store brands. The Great Atlantic and Pacific chain, for example, added about 20 lines to its own label list in the years 1937-40 and did about 25% of its total volume in its own labels, an increase of 15% to 20% over the same period.

The merchandising management of the corporates during 1940 continued to experiment and to keep in a flexible position with a watchful eye on competition. Woolworths, for the first time, issued a merchandise catalogue for its holiday season. One variety chain announced serious consideration of credit sales. Several drug chains began to re-emphasize the professional side of drug retailing. One of the largest food corporates decided to eliminate direct deliveries by manufacturers to its unit stores and announced that the resulting savings to the manufacturer should be passed on to the chain in lower prices and already many manufacturers have adjusted their prices to this chain accordingly. By and large, new ideas and new methods were approached without timidity.

Active chain store co-operation with the farmer continued. Producer-consumer drives, designed to distribute surplus crops and to bolster shaky markets, promoted the movement of farm commodities by store displays, co-ordinated advertising campaigns and special educational programs.

Chain store co-operation with the consumer movement on a closer basis than ever before was also characteristic of 1940. The food chains, in particular, led in experiments in grade-labelling, one of the long-term goals of consumer organizations.

On the labour front, the corporates experienced a few serious strikes during 1940 but, in the main, improved their labour relations and were increasingly experimenting with the use of trained labour relations experts and planned industrial relations programs. Chamberlain, Arthur Neville (1869-1940), British statesman, was born March 18. For an account of his career prior to his appointment as prime minister in 1937 see *Encyclopædia Britannica*, vol. 5, p. 201. As prime minister he was confronted with the task of meeting the growing menace of Germany to the peace of Europe. His policy of conciliation culminated in the pact of Munich in 1938, which he declared guaranteed "peace in our time." Great

"CIVILIZATION MOURNS." A tribute to Neville Chamberlain, by Shoemaker of the *Chicago Daily News*

Britain and France had pledged their support to Poland if attacked, and when Germany made war on Poland Great Britain and France declared war against Germany. He was succeeded as prime minister by Winston Churchill May 10, 1940, and gradually withdrew from all political activity. He died at his country estate, Heckfield house, Odiham, Hampshire, on Nov. 9.

Chambers of Commerce. While normal business volume was appreciably larger in the United States during the first half of 1940, the national defence program inaugurated by the United States government in mid-year provided an impetus which resulted in greatly increased industrial output for the year. United States business and industry responded promptly to the requirements of the defence program. Chambers of Commerce and trade associations adapted themselves to the situation, offering many services which aided industrial mobilization. They also gave increased attention to taxation, public expenditures, governmental regulation and other national issues, particularly as related to defence.

The Chamber of Commerce of the United States, a federation comprising 1,600 Chambers of Commerce and trade and industrial associations with membership of over 600,000 business men, continued its program designed to create a wider public knowledge of the underlying functions and motives of business. It inter-

preted the economic and social aspects of the national defence program and stressed the need for effectuating it within the confines of the U.S. system of private initiative.

Chambers of Commerce in Europe were called upon for a wide variety of additional services resulting from the interruption of normal export and import trade channels by war blockades and restrictive regulations. In the belligerent countries trade and industrial organizations were marshalled into offensive and defensive war efforts. The trade trend in strategic and critical war materials was of special concern to many organizations.

Cheese. Production of cheese in the U.S. in 1940 reached a new all-time high, estimated by the department of agriculture as 658,200,000 lb., a 9% increase over the 1939 output of 533,386,000 pounds. Unique in the factors contributing to the increased production was the sharp decline in imports of European cheese in the first six months of 1940, owing to the European war, and, after the surrender of France to Germany, the almost complete cessation of U.S. imports of cheese from Europe. This development immediately opened up a market in the U.S. for South American cheese manufacturers, and in 1940, for the first time in history, the U.S. imported large quantities of cheese from South America, some from Brazil, but mostly from Argentina. As a result cheese imports into the U.S. were not greatly affected by the cutting off of European shipments.

For the first nine months in 1940 U.S. imports of cheese were 26,193,638 lb. compared to 37,612,750 lb. in the same period in 1939. With the exception of the famous French blue-mould cheese (Roquefort), U.S. cheese manufacturers reproduce all the better known European cheeses, including Camembert, Limburger, Gorgonzola, Bel Paese. U.S. production of a number of European types of cheese increased 50 to 75% in 1940. South American manufacturers also duplicate favourite European cheeses and ship to the U.S. Roquefort cheese is made of sheep's milk, of which there is not a commercial supply in the U.S., and, therefore, blue-mould cheese made in this country is manufactured from cow's milk, as in South America. In October the French producers of Roquefort cheese (the Société Anonyme des Caves et des Producteurs Réunis de Roquefort) obtained an injunction in the New York state supreme court against three Argentine cheese manufacturers and their New York agents forbidding them to label and package Argentine blue-mould cheese in a manner similar to that of Roquefort. Exports of U.S. cheese, processed cheese and spreads advanced in 1940 over 1939. For the first nine months of 1940 exports of cheese were 399,063 lb. compared to 387,617 lb. during the same period in 1939. Exports of processed cheese and cheese spreads the first nine months in 1940 were 1,120,031 lb. compared to 725,254 lb. in the same months in 1939. The average retail price for cheese in the U.S. in 1940 was 25.8 cents per lb. compared to 25.3 cents per lb. in 1939. Average prices paid Wisconsin farmers for 10.43 lb. of milk in 1940 was 13.1 cents compared to 12.1 cents in 1939. Cheese production in the U.S. increased 39% in the 1930-39 period. (See also DAIRYING; MILK.)

(S. O. R.)

Chemical Warfare. The dearth of official information with reference to the use or development of chemical agents and equipment during the European War which began in 1939, necessitates increased reliance on newspapers, magazines and radio commentators. Sources of information may have been excellent, but insofar as chemical warfare developments of 1940 were concerned, the news was not confirmed by official study and pronouncement.

Two facts of outstanding interest, nevertheless, marked the year 1940. First was failure to employ toxic chemicals in military campaigns or in aerial attacks on cities. Second was the unabated energy with which measures for protection against gas warfare were carried forward.

Undoubtedly these two facts bear a direct relationship to each other. Had anti-gas defence been lacking, it is most probable that the defenceless state would have been subjected to gas attack. The fact that protective measures were maintained and reinforced during the year explains in part, although not wholly why resort was not had to gas warfare in connection with the intensive military operations of 1940. France and Great Britain it would appear, were unready for an "all out" offensive use of toxic chemicals. If this was so, they had more to lose than to gain by initiating gas warfare.

Germany's failure to use toxic chemicals in the Low Countries and in Northern France may be ascribed to the same reason, which caused her to omit such weapons during the Polish campaign of 1939. Again it was a one-sided struggle in which a more powerful force, by the very vigour of its attack, quickly overwhelmed its adversaries. The rapidity of advance made the use of chemicals unnecessary. On the other hand, employment of persistent chemicals of the mustard gas type could easily have been detrimental to an advance over a broad front.

Less clear are reasons for non-use of toxic chemicals in bombing raids, especially in view of the unhesitating German policy to utilize every advantageous means to victory. It may be assumed that Germany possessed ample resources for attacking England with gas. The threat of retaliation, however, continued ever-present as long as the royal air force could not be prevented from reaching populous German cities.

The gas mask as an item of individual equipment is normal to all modern armies, but the need for protection of the civil population did not become apparent until the development of long-range bombing planes made it clear that targets were no longer confined to the forward areas of the battle zone. As early as 1921 certain foreign military writers began to stress the importance of concentrated attacks by long-range bombers upon cities, manufacturing, supply or transportation centres far behind the battle front. Such attacks could be made by chemical bombs and spray, as well as by high explosive and incendiary bombs. Preparations were needed to meet this new and dangerous threat to the heart of an army—the civilian population at home. Long before the outbreak of the war in 1939, the leading nations of Europe were devoting considerable money, technical skill and manufacturing effort toward adequate passive defence measures for the civilian. These included the provision of a gas mask for every citizen, gas and bombproof enclosures and thorough education of the public in protection against chemicals. These air raid precautions were best achieved in Great Britain, and the relatively small loss of life in bombing raids on British cities during 1940 may be credited to thoroughness of that system. The fact that the British public was well prepared for defence against gas undoubtedly was added insurance against such an attack.

A rapid and effective development in chemical warfare took place during the three years immediately following its introduction in 1915. Nations have been at least reluctant to divulge developments since that period, but it is common knowledge that chemical science and industry have made tremendous forward strides. Consequently the average layman was ready to believe that similar progress had been made in war chemicals and to accept at face value boasts of a secret weapon as some new all-powerful, devastating gas against which available protection was useless. Nerve and paralyzant gases had been so frequently

mentioned in press accounts that for a few days during May 1940 the surrender of the Belgian fort Eben Emael with its garrison of 1,000 men to a squad of Germans was ascribed to an attack by a mysterious paralyzant gas.

Chemical Offence.—The chief chemical warfare agents used during 1940 were screening smokes and incendiaries. Screening smoke tactics were effectively employed in both land and sea battles. Smoke units, armed with medium calibre rapid firing mortars, were available to the Germans. The principal mission of these troops was to fire smoke; but they were undoubtedly able to fire other chemicals with the same equipment. Germany utilized smoke tactics with exceptional efficiency to blind observation, eliminate enemy aimed fire and to immobilize enemy movements within smoke. These tactics were especially effective during the closing weeks of the campaign in France to facilitate river crossings, to establish bridge heads and to assist the rapid advance of infantry and tanks. At sea both sides used screening smoke to seek concealment from aimed fire or to escape a superior foe.

The Germans, according to news accounts, also used flame throwers mounted on tanks against personnel in concrete pill boxes and tanks. Incendiary bombs in tremendous numbers and of varying size and composition were used during the latter half of the year by Germany, Italy and Great Britain. These were generally used in conjunction with attack by high explosive bombs and devastating results were frequently achieved. Incendiary bombs were usually of the thermit type or of electron metal. The thermit is a mixture of powdered aluminium and iron oxide which react chemically and generate intense heat. Electron bombs are used principally in small scatter type bombs and have a case of magnesium alloy which is ignited by a chemical mixture and burns with intense heat. Since the quantity delivered depended entirely on carrying capacity, Germany's much more numerous air force delivered a much larger number of bombs with greater incendiary effect than that of Great Britain. In addition to normal incendiary bombs, Great Britain used a novel incendiary in the form of self-igniting leaves. These were said to consist of a thin layer of a cellulose compound, behind which was specially prepared phosphorus on a small sheet of thin cardboard.

The trend of development continued toward more effective chemical and incendiary bombs and spray apparatus for dissemination of chemicals from the air. There was a constant effort to secure increased range in ground weapons. Self-propelled track-laying chemical tanks have been developed for use as mobile ground-spraying apparatus, or to discharge cylinders of gas on or near an enemy line. No information is available on new chemicals for war use. It appears that modification of types known or more efficient methods of dispersion will first appear, rather than entirely new discoveries.

Chemical Defence.—Continued improvements as to fit, comfort and effectiveness of gas masks have been made. The canister has become more compact and efficient by improvements in its chemical content of charcoal and soda lime for neutralization of war chemicals. In addition, more efficient types of filters have been developed to remove minute particles of irritant smoke. Effective filtration of these particles has always been a serious problem. Air purifiers for gas-proof shelters operate like giant gas mask canisters through which the air is pumped into the enclosure. Mustard-proof clothing and methods of decontamination have been improved.

In the United States efforts continued toward providing adequate protection to its army.

Careful study of reports from the warring countries indicates excellent means of protection against gas—far better than are possible against high explosives. Any relaxation in provisions for protection against gas might be a signal for the use of gas against

the civil population. Gas, if effectively used with high explosive, might be the psychological means of weakening the will to resist.

(HA. SH.)

Chemistry. In 1940 in the field of chemistry literally thousands of new research contributions have appeared. A few of the more interesting topics of the year will be presented in sufficient detail to outline their significance.

Synthetic Optical Crystals.—Modern advances in ultraviolet and infrared spectroscopy have developed the need for crystals of larger size than those found in nature. Glass prisms are satisfactory for the visible range but penetrate only slightly into the ultraviolet or infrared. Prisms of lithium fluoride are valuable in ultraviolet spectroscopy and prisms of sodium chloride (rock salt) have long been popular for work in the infrared region. H. C. Kremers of the Harshaw Chemical company reported a satisfactory method of growing these and other optical crystals. Synthetic sodium chloride crystals 8 in. in diameter and weighing as much as 25 lb. may be grown. Briefly, the method is as follows:

A platinum cylinder is filled with the desired salt which is melted in an electrically heated tube furnace. A diaphragm separates this furnace from a second furnace which is maintained below the fusion temperature of the salt. The crucible then is lowered very gradually—a matter of days—through the diaphragm and continuous crystallization occurs at the diaphragm. To anneal the crystals they are held for a week at a temperature of about 50° below the temperature of fusion.

Marijuana.—Hemp fibre has long been used for rope and clothing. Hemp seeds have been pressed for oil. The hemp plant also produces "marijuana," a term that includes any part of the plant (genus, *Cannabis*) or extract therefrom which brings about intoxication in man. In 1940 Adams and collaborators at the University of Illinois isolated and determined the structure of the active substance in the plant.

Between the period when the female plant (*Cannabis indica*) is about to flower and until the seeds are mature, the hairy tops contain a sticky resin. Some resin is obtainable also from the male plant but in much smaller quantity. The resin contains the intoxicating principle of the plant. Plants grown in hot dry climates such as Chinese Turkestan produce much more resin than those grown in moist, temperate climates.

The resin of the hemp plant itself may be extracted with light petroleum. From the red oil thus obtained two compounds called cannabidiol and cannabinol have been isolated. These account for three-fifths of the oil but explain none of its activity since they are inert physiologically. The other two-fifths probably contains tetra- and hexahydrocannabinols which have demonstrated potency.

Chemically, it has been established that cannabidiol is a substituted biphenyl. One of these phenyl groups has a pentyl radical in position 4 and phenolic hydroxyls in positions 2, 6. The other phenyl group is really tetrahydrophenyl and it is substituted by α -methylvinyl in position 2 and methyl in position 5. The two phenolic functions explain the suffix "diol" in the name cannabidiol. This compound, as mentioned above, is inactive physiologically, but on treatment with acidic reagents it isomerizes smoothly to a new substance, tetrahydrocannabinol, which has very high marijuana activity. All that happens chemically in this change is addition of one of the phenolic hydroxyls to the methylvinyl group, thereby forming a new 6-membered oxygen-containing ring which is shared jointly by the two pre-existing phenyl rings.

Cannabinol resembles tetrahydrocannabinol structurally but not physiologically. Loss of the four hydrogens brings about loss of the marijuana activity. Adams demonstrated the dehydrogenation of tetrahydrocannabinol to cannabinol in laboratory experi-

ments and suggested that reactions in the hemp plant might be similar.

Synthetic Rubber.—The year 1940 witnessed a remarkable development in the technology of rubber-like materials. Rubber itself is a hydrocarbon, the molecules of which are of gigantic size compared with molecules of simple hydrocarbons such as pentane, acetylene, benzene or naphthalene. In spite of its vast size, consideration of the structure of the rubber molecule reveals a simple pattern. It is merely a collection of about 2,000 small methylbutadiene or isoprene molecules joined end to end.

Experimentally, one may convert methylbutadiene, a low boiling liquid, into rubber by leaving it in contact with metallic sodium. No convenient source of methylbutadiene is known, however, so the method is impractical.

Butadiene and chlorobutadiene do have convenient sources so they provide good starting materials in the synthesis of rubber-like products. Both may be made from vinylacetylene (C_4H_4) which, in turn, is made by causing acetylene (C_2H_2) to double up with itself in the presence of copper salts. Addition of hydrogen chloride yields chlorobutadiene (C_4H_5Cl), whereas insertion of hydrogen yields butadiene (C_4H_6). Butadiene may be made also by catalytic subtraction of hydrogen from butane (C_4H_{10}) or butene (C_4H_8), but these are available only in petroleum-bearing countries.

The "rubber" made from chlorobutadiene has been marketed in the United States since 1932 under the name of neoprene. The buna rubbers, which have been developed considerably in Germany, are even newer. Their manufacture involves butadiene and another unsaturated substance. Buna-S incorporates butadiene and styrene. Buna-N and perbunan are made by the co-polymerization of butadiene and acrylonitrile (vinyl cyanide). Buna-N and neoprene resist the swelling action of gasoline far better than ordinary rubber does. Buna-S possesses better heat resistance and abrasion resistance than rubber itself. It is noteworthy that these desirable properties arise from the introduction of some other unit to participate in a "cross-polymerization" with the butadiene.

Another butadiene development of 1940 was announced by W. L. Semon of Goodrich Rubber Co. A co-polymer named ameripol is made from butadiene and another material (not revealed as yet) made from natural gas and air. It is made into a milky emulsion with soap. When heated the ingredients react to form a liquid similar in appearance to rubber latex and similar also in the manner of processing. Ameripol is said to be used already in tire manufacture.

"Butyl rubber" is another achievement. It was announced by Frolich and co-workers of the Standard Oil Development Co. (N.J.). As before, butadiene is used but not as the chief ingredient. Essentially this rubber-like material is made by polymerizing olefins. Only a small amount of butadiene (a diolefin) is added. As a matter of fact the olefin gas isobutylene may be polymerized without butadiene to yield a "polyisobutylene" which is rubber-like because the molecules in the polymer consist of 500 to 5,000 isobutylene units. This polyisobutylene is essentially a saturated hydrocarbon, inert toward ozone, nitric acid, sulphur and hence incapable of vulcanization. If just enough butadiene gas is mixed with the original isobutylene gas to provide for sufficient unsaturation in the polymerized mass so that it can be vulcanized, the resulting product is "butyl rubber." When cured, it is devoid of unsaturation and is as inert chemically as the polyisobutylene. It is more stretchable, however, than the rubber from trees.

Isobutylene is a gas produced during the cracking of petroleum. It may be prepared also by pyrolysis of isobutane, an important ingredient of natural gas. Normal butane, also in natural gas, may be rearranged into isobutane by appropriate catalysts at high

temperatures and in the presence of other catalysts it may be changed by dehydrogenation into butadiene. Therefore, natural gas and petroleum become the raw materials for this new synthesis of rubber.

Atomic Disruptions.—Much information about radioactivity has been collected since the discovery of radium by Pierre and Marie Curie in 1898. The cause of radioactivity was stated by Rutherford and Soddy in 1902 to be spontaneous atomic disintegration with the attendant emission of energy in the form of rays or particles. A decade passed before Rutherford made his fundamentally important conjecture of the existence of the nucleus of the atom. Rutherford again in 1919 demonstrated that the nucleus could be disrupted artificially by bombardment with high-speed helium nuclei or "alpha particles" from natural radioactive sources. The alpha particle may be regarded as a high-speed bullet designed to pierce the nucleus of the target atom so as to knock out one or more of its constituent particles. In 1932 Cockcroft and Walton learned how to impart sufficient speed artificially to a hydrogen nucleus so that the latter could bring about atomic disintegrations without help from radioactive sources. Their method was to accelerate the hydrogen nucleus to a bombarding speed in a high voltage field obtained by the use of electrical transformers. Shortly thereafter, this method was modified and greatly improved by Lawrence's cyclotron. In this way over 700 atomic transformations have been studied and nearly half of these have produced radioactive atomic species. From 1936 to 1940 more artificial radioactive species have been produced and identified than were previously known of the natural variety.

Hevesy's work in biochemical experiments with radioactive phosphorus is but one of many important applications which have come to the front since the advent of artificial radioactivity. Red phosphorus (atomic weight 31) is treated with accelerated deuterons (the nucleus of "heavy hydrogen") from a cyclotron; then a supply of radioactive phosphorus is produced, the latter having an atomic weight of 32 and a half-life period of two weeks. When changed to a phosphate and administered in various organs of an animal its transformations in the body can be followed closely. In this way, for example, it has been shown that almost immediately after the introduction of active phosphate into the blood stream a large part of the P^{32} is to be found in the skeleton. The role of phospholipids in fat metabolism is another of the many problems which have been attacked by this method.

Bombardment with fast moving particles is not the only artificial means of disrupting atoms. Fermi showed that bombardment with either fast moving or slow moving neutrons (particles with no charge) would cause breakdown. Until 1940 no one had suggested that an atomic nucleus under bombardment might split into two approximately equal parts, and the helium nucleus was the heaviest particle previously known to be severed from an atom. It has been shown, however, that when slow neutrons enter the nucleus of certain uranium or thorium atoms, notably uranium of atomic weight 235, there is subsequent splitting into pairs of fragments with the emission of three high-speed neutrons together with electrons or beta particles for each entering slow-speed neutron. This tremendous increase in emitted energy has led to much speculation as to the possibility of harnessing uranium 235 as a source of power. According to S. C. Lindholm it is estimated that about 80,000 lb. of uranium is associated with the annual production of 10 grams of radium. Most of this uranium to be sure, is of the 238 variety but about 570 lb. of it represents the 235-isotope. Since only 5 lb. of the latter would suffice for large power production, it is evident that the natural source is large enough to be very important if later work shows that the isotope can be separated. No acceptable method for this separ-

on is known, however, and until one is conceived it seems useless to anticipate the advent of atomic power. The story comprises part of one of the most fascinating chapters of chemistry, whether or not this type of energy ever becomes harnessed.

Hammett, *Physical Organic Chemistry*; James Murray Luck and 26 contributors, *Annual Review of Biochemistry*, vol. 1, Stanford University, Calif. (1940); Arthur K. Solomon, *Why Smash Bombs?*, Harvard University press; E. Ernest Dorsey, *Properties of Ordinary Water Substance*. (C. D. Hu.)

Chemistry, Applied. Advances in industrial chemistry have been made in all important fields. To compete with metal and fibre as containers, is a stronger glass, "Duraglass," which when in a new design provides a lighter weight bottle, cheap enough for single service. A new thin glass brick, "Thermopane," and a hollow glass brick containing a gas that becomes luminous when an electric current passes through it are innovations for the building industry. Further progress was made in effecting glass capable of greater light transmission by a suitable chemical treatment of the surface, such as with 1% nitric acid solution to form low refractive index surface films. When this process is followed by a baking operation the glass surface is made much more durable. As for invisible films on glass to reduce light lost by reflections, evaporated films of magnesium fluoride can be hardened by heat treatment and the effective hardness can be further increased by the application of oil or soap as a lubricant and waterproofing agent. The non-reflecting surface glass announced in 1939 was being commercialized in 1940. Improvements were made in the process of producing mirrors, using a continuous spraying method. A laminated glass consisting of one sheet high in its content of lead oxide between two thin protective sheets was developed as a guard against X-rays.

New laboratories for research on powdered metals were established. Nails were finished in colour to match coloured wallboard, and a process utilizing a special type of electric arc furnace to produce single ingots of two or more compositions integrally bonded together called "Pluramelt" was perfected. Accomplishments may be recorded in the effort to produce aluminium from clay and a large plant was erected in Texas for the separation of the lightest metal, magnesium, from sea water.

The rare metal, polonium, was used in the electrodes of spark plugs. Indium became a metal of commercial importance and a magnetic alloy of cobalt, vanadium and iron that can be drawn and rolled was introduced. An alloy of copper and silicon to take the place of copper-tin bronzes was announced and is of some importance in the effort to conserve tin. Cable sheathing, ordinarily made of a lead-antimony alloy, can be produced with calcium as a substitute for the antimony, with entirely satisfactory results. Here, again, the elimination of an imported material, antimony, is noteworthy.

Potassium hydroxide, potassium chlorate and potassium cyanide are now manufactured in the United States. Thiodiglycol was synthesized from ethylene oxide and hydrogen sulphide. A plant for the synthesis of phenol by a new process was completed after four years of research and development and a plant was authorized by federal authority for the manufacture of toluene from petroleum gases. A process for the synthesis of glycerine which had been proved on a small scale entered the semicommercial stage with a production of a ton a day. A considerable number of new organic dyes was announced during the year, as was a new group of calcium silicate pigments.

Further progress was made in preparing further derivatives from sulphanilamide to reduce toxicity, make possible the use of smaller doses, and perfect compounds especially applicable to certain types of infection. One of the vitamins was found effica-

cious in overcoming keratitis, an infection of the eyes, and the presence of important vitamins in grass, which may be dried for incorporation in powdered form in certain feeds and foods, was announced. Riboflavin or vitamin B₂ was produced on a commercial scale at costs low enough to enable its use in feeds as well as foods as a reinforcing nutrition agent. The vitamins thus become available through the grocery as well as through the pharmacy.

After having studied 135 treatments for the prevention of mildew, the department of agriculture found the cadmium chloride process one of the simplest. Grapefruit seed oil after sulphonation is used as an assistant in textile dyeing. Casein fibre obtained from skim milk was used as a blend with rabbit fur to make high grade hat felt. A new fibre from the protein of soybeans was produced for use with wool and mohair for automobile upholstery. Dots and similar patterns on fabrics were obtained by the use of an electrostatic field, producing unusual patterns with far better wearing qualities than those heretofore available. Advances in mothproofing include treatment of wool with an alkylene oxide, imine or sulphide in which the reagent is chemically bonded to the wool. A new method of manufacturing coloured filaments incorporated the dyestuff or dyestuff components in the coagulating bath, so that the colouring was accomplished simultaneously with the formation of the fibre itself.

Nylon, a synthetic fibre, was introduced commercially and a large expansion of facilities for the production of this fibre was planned. Meanwhile ways were found to make the new fibre especially resistant to acids and alkalies, to crimp the fibres mechanically to give many of the properties of wool, to preshrink nylon and to use it in coating paper. Its use as a bristle for various types of brushes was greatly expanded.

Spectacular have been the advances in synthetic rubber-like plastics or elastomers. Improvements in neoprene and Thiokol include the elimination of objectionable odour. Koroseal found new applications, and rights for the manufacture of the various Bunas in the United States were secured. Butyl rubber, Ameripol and Chemigum were newcomers derived from petroleum and already in small-scale commercial production. Tires produced from such American materials were on sale, and the world situation made advisable plans for large-scale production as soon as plants can be erected. New uses for rubber and the introduction of these synthetics in places where natural rubber is unsatisfactory added to the importance of such compounds in modern industry.

The plastics saw additions to their already long list. "Melamac," a melamine resin, was produced for coating and laminating purposes; polyvinylidene plastics under the name "Saran" made their bow and were seen by the public in use to supplant rattan, as addition to leaders, lines, and other fishing equipment, to mention but a few applications, and calendered vinylite sheets were introduced. Among the new uses should be mentioned costume jewellery, laminated building board of great size (up to 8x20ft.), containers formed like pasteboard boxes, ladies' shoes, furniture and football helmets. An improved pencil was made by depositing on the leads a surface coating to which glue adheres well, thus virtually welding the lead and wood into an inseparable unit.

"Self-heating" canned goods were introduced in the food industry. When a false bottom is penetrated, air combines with chemicals in a compartment to warm the contents of the can. It was found that a tiny quantity of gum guaiac will prevent the oxidation of lard, that a little calcium chloride will enable canned tomatoes to retain their shape, and that manganese is an important item in feed for turkeys. New paints reflect as much as 72% of ultraviolet light from health lamps and progress was made in developing paints of germicidal value. New chemical methods made available new species for paper pulp, and sodium

CRYSTALS of the very rare sugar, ribose, believed to be the most widely distributed sugar in plant and animal life (magnification, 100 diameters). It was available for research in 1940 because of the U.S. bureau of standard's new method of production which reduces cost to approximately \$2.00 per gram

Below: THE FIRST U.S. TIRE manufactured of synthetic rubber was displayed at New York City in 1940

DOMESTIC PRODUCTION OF THIOUREA was begun in the United States in 1940 to supplement or replace foreign sources of supply. This is an important chemical used in photography and in the

lorite was manufactured on a large scale for bleaching more satisfactorily some pulps used in paper manufacture. (See also CHEMISTRY AND ENGINEERING, AGRICULTURAL, U.S. BUREAU OF; CHEMURGY; INDUSTRIAL RESEARCH; PLASTICS INDUSTRY; VITAMINS.) (H. E. H.)

Chemistry and Engineering, Agricultural,

U. S. Bureau of. This bureau conducts chemical and technological research on agricultural products, studies farm machinery and its use, mechanical processing of cotton and flax, construction of farm buildings and the use of electricity in agriculture and recently has expanded its studies designed to increase the use of farm commodities in industry. For carrying on this work on industrial utilization of farm crops, the bureau finished and was equipping four regional laboratories provided for by the congress in 1938. These laboratories are at Peoria, Ill., New Orleans, La., Philadelphia, Pa. and San Francisco, Calif. Active research was expected to begin in at least three of them early in 1941.

Some of the chief results of the bureau's research during the 1940 fiscal year are listed here:

Special mechanical equipment and an economical procedure were devised for use in the preparation of soybean sprouts.

New fruit products developed in collaborative work included individually frozen apple slices for pies, frozen fruit purees for ice cream and sherbets, dehydrated sugared strawberries, clarified strawberry juice, butter and candied pomace from strawberry pulp, fresh prune beverage, fruit-and-milk beverages and improved packed juices of several fruits.

Hesperidin, the glucoside in orange peel, was found to be non-toxic. Cadmium compounds were found to have a toxic effect like that of fluorine compounds; both produce mottling of teeth and inhibit the action of the enzyme phosphatase.

A natural enzyme activator was isolated from unbleached wheat flour. This is a protein substance, possibly a lipoprotein, containing a sulphhydryl group and having the properties of a very effective oxidation-reduction system.

A method was devised for producing papain of improved quality from papaya latex. Another was developed for separating the enzyme bromelain from waste pineapple juice without preventing subsequent fermentation.

The principal allergenic constituent of cottonseed was isolated and characterized as a protein-like compound not conforming to any type in existing classifications. The name "natural protease" was suggested.

A crystalline organic selenium compound having the properties of an amino acid was isolated from a plant grown on seleniferous soil.

Improved mechanical equipment was designed for use after a mild chemical treatment for removing most of the water from sweet potatoes before drying with hot air. Dried sweet-potato meal was found to be a good source of carbohydrate for balancing cottonseed meal in feeding cattle.

As high as 99.5% of the oil in ground tung nut kernels was extracted by solvent alone, without regrinding.

Soybean oil was separated by liquid-liquid solvent extraction into two fractions, one having a higher iodine number than the other.

An application was filed for a public service patent on a process for making plastics from hemicelluloses and phenols; patents were procured for processes for preparing a plastic from lignin and alkyd resins from citric acid.

Rosin soap solutions were found to be more active as germicides against *staphylococcus aureus* than were solutions of soaps made from natural fats and oils.

A formerly unknown biological activity of bacteria, the production of ketogluconic acid, was discovered; the bacterium was isolated.

Carbohydrate in dried egg-white was found to be responsible for gradual darkening and decrease in water solubility. Means for eliminating carbohydrate before drying were devised.

In studies on farm structures, it was found that grass silage exerts greater pressure on silo walls than does corn silage, that low temperatures help to preserve wheat in storage and that wind-pressure ventilators on grain bins reduce moisture content.

The improved beet-seed planter developed by the bureau, which deposits single seed balls, was put on the market by a manufacturer.

A two-row sweet potato planter was developed which greatly reduces the labour of setting out the plants.

Round cotton bales and high-density bales were found to have advantages over the customary gin bales.

Improvements were made in flax-handling machinery and processes. (H. G. K.)

Chemotherapy. Among the more valuable contributions of the year were those wherein there was reported results of more extended and critical observations leading to better evaluation of the status of the newer additions to materia medica from 1936 to 1940. Probably the chief contribution during 1940 was that of the preparation of plasma (from human blood). In many conditions the use of plasma is quite as effective as transfusion of blood or the use of blood banks. It has an advantage in that where it may be used it is not necessary to type the blood. Some pharmaceutical concerns have undertaken to prepare dried plasma which permits storage of the substance with less bulk and less danger of decomposition or freezing and prolongs its keeping qualities. Plasma will not take the place of blood where the need of additional haemoglobin or blood cells is indicated.

In 1940 another member of the sulphanilamide family made its appearance—a thiazole derivative "sulphathiazole." Its chief advantage over sulphanilamide and sulphapyridine is that it causes less nausea in many patients. Clinical work indicated that sulphathiazole may have valuable effect in dealing with infections caused by the staphylococci (sulphanilamide and sulphapyridine are very effective in certain types of streptococci). In general, sulphathiazole is, however, more effective against certain strains of streptococci, meningococci, etc., than against staphylococci.

Interest was aroused by the possibility of irradiating phosphorus with beta rays; this is done by a powerful emanator called the cyclotron. There have been many exciting, but vague, claims made about the possibilities of this substance when used in the human body. The discovery is valuable because by its use one may trace its course in the human body under certain prescribed conditions and obtain valuable data.

The interest in "war medicine" and the new research in the everchanging fields of antiseptics and germicides led to new interesting observations. Meleney and his co-workers advocated the use of a highly purified form of zinc peroxide in the treatment of war wounds. This method has not yet been generally accepted by the medical profession as a whole.

In the passage of each year the attitude of scientists towards the value in clinical medicine of antiseptics and germicides seems to become more conservative. Price and co-workers (*Arch. Surg.* 38:528, March 1939), as a result of extensive studies came to the conclusion that the best available antiseptic for skin disinfection is 70% alcohol (this is by weight, not by volume). While the mercurials are still looked upon as valuable bacteriostatic agents, they have been found to be quite deficient as bactericidal substances.

Work in 1940 has confirmed the view that stilbestrol is an efficient and relatively cheap substitute for the natural female sex hormones, so far as its activity is concerned, but the possibility of toxic reactions following its use convinced authorities that its sale in interstate commerce was unwise, and a number of pharmaceutical houses withdrew their applications to the U.S. Food and Drug administration for permission to sell the product in interstate commerce.

No new vitamins were introduced into therapeutic practice during 1940. Authorities in the treatment of pellagra have come to the conclusion that, while nicotinic acid is often a specific against this disease, very frequently patients having a vitamin B₁ (thiamin hydrochloride) or a nicotinic acid deficiency are also deficient in the intake of other members of the vitamin B complex, particularly nicotinic acid and riboflavin. There was no confirmation of the suggestion made in 1939 that vitamin E is effective in overcoming the progressive disease known as amyotrophic lateral sclerosis, for which the newspapers coined the name "garret's disease."

The medical profession and the public were particularly cautioned during the year against the indiscriminate use of nasal sprays which contained liquid petrolatum. This substance, if induced into the lungs, causes a pneumonia, not infrequently fatal, which, for lack of a better name, has been termed "lipoid" pneumonia.

Ever since the introduction of insulin, investigators have endeavored to isolate new hormones from the pancreas. Some evidence has been adduced which seems to warrant the conclusion that an active substance of the pancreas is probably not choline, and that there is a specific internal secretion of hormone, distinct from insulin, which has some effect against fatty degeneration of the liver. Much more informative evidence is necessary.

Considerable interest was aroused during 1940 about the possibility of histaminase, an enzyme, being used for desensitizing certain types of allergic individuals.

The council on pharmacy and chemistry felt, however, that the evidence was not sufficient to recognize the use of the drug for this purpose.

The question of the use of bromides continued to be quite a problem and reports of bromide intoxication were increasing. The government took steps to require a limit on the amount of bromides which might be sold to an individual over the counter and physicians were cautioned against the too prolonged, or frequent, use of ordinary bromide preparations.

A method that has great possibilities for use was the continuous drip method of administering certain antisyphilitic drugs. In cases under trial, syphilis has been cured in as few as five days.

However, the method is not without danger and the authorities working on it have strongly warned against its trial except under competent conditions.

For many years manganese compounds have been extolled for the treatment of certain disorders, particularly of the skin. A thorough study was reported in 1940 which discredited the vaunted value of manganese compounds. (See also DENTISTRY; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.) (P. N. L.)

Chemurgy. The consumption of farm-grown raw materials for non-food purposes advanced more in the U.S. in 1940 than in any previous year. There was also a marked increase in chemurgic research.

The basic idea of chemurgy is to advance the utilization of farm materials in industry, mainly for inedible and nonwearable consumption through (a) new uses for present crops; (b) new crops for new or established uses; and (c) profitable markets for wastes.

The requirements of U.S. national defence, and the appearance of actual or impending shortages of materials formerly imported, stimulated research looking toward supplying national needs with domestic farm crops and toward establishing new crops. Surveys indicated extensive opportunities to develop domestic agricultural production of materials for which the nation has heretofore relied on foreign sources.

As a case in point, with tung oil supplies in the U.S. for only six months' requirements and importations dependent upon the Burma road remaining open, the paint and varnish industry turned with new interest to home supplies for the annual consumption of 700,000,000 lb. of drying oils. Gulf coast tung orchards contributed 5,000,000 lb., their largest crop to date. Soybean oil use in paint increased notably. Demand rose for dehydrated castor oil, which is suitable for many of the uses of tung oil. Preparations were being made for resuming farm production of castor beans which has been slight since the end of the 19th century. Castor-bean supplies come mainly from Brazil, more than 150,000,000 lb. annually being imported.

An important new step in the drying-oil field was a process for fractionating vegetable oils. By this process, which in principle resembles petroleum distillation, the fraction of the oil with a high iodine number may be drawn off and sold as a drying oil, while other portions remain suitable for soap. The maximum values of the oil are obtained. Operated by a Chicago meat-packing company, the process is in commercial operation.

Important to the dairy industry was the appearance in 1940 of a commercial process for manufacturing fibre from casein, a product of skim milk. The fibre made its bow to the public in men's felt hats. Hat manufacturers, who have depended mainly on rabbit fur grown in northern Europe for their best felts, pronounced the new milk fibre superior in every respect except toughness. Ten per cent or more of the casein fibre was in 1940 being used in a large proportion of the better felt hats manufactured. The casein fibre consumption for 1940 was estimated at 800,000 lb. Since this represents only one-tenth of one per cent of the amount that could be made from the annual 40,000,000,000 lb. of skim milk that have only limited commercial outlets, it is expected that future production will increase extensively. Casein "cold water" paints consumed 1,500,000,000 lb. of skim milk. Plastics and paper-sizing utilized smaller quantities.

Another synthetic fibre that advanced during the year to a point where commercial utilization was soon expected is a product of soybean protein. It will be used first in automobile upholstery.

Matured in 1940 was a new step in cotton production with high chemurgic significance. This was the result of a request made in 1935 to tire manufacturers by a Mississippi cotton planter. He asked for the specifications of the foreign cotton they imported for tire fabrics. With the specifications in hand, he employed a plant geneticist, and in 1940 sold, at a substantial premium, 3,000 bales of cotton grown to meet these specifications. The effect of his achievement, which will be measured in immensely larger production in succeeding years, is not only to promise the tire industry domestic supplies, but to take a portion of the cotton crop out of the highly competitive market for the ordinary fibre.

Advances were reported in a new use for cotton that may, if proved successful, consume large quantities. This is for insulation, the fibre being fireproofed by a simple chemical process.

The initial large-scale mill to utilize southern pine for newsprint completed its first full year of operation. Established at Herty, Texas, in late 1939, at a cost of more than \$6,000,000, the mill ran steadily and sold its output of 150 tons daily to near-by newspapers. Efforts were begun looking toward a second newsprint mill. Numerous craft-paper mills and wallboard companies made markets for vast acreages of woodland.

Also completing its first full year was the new cigarette paper plant at Brevard, N. C. Operating at the rate of a carload and a half of cigarette paper daily, the mill consumed a heavy tonnage of flax fibre purchased from farmers in California and Minnesota. The mill provided a wholly new market for these farmers, as well as new employment for more than 1,000 workers at the factory itself. Formerly a French industry, utilizing European linen rags, the new enterprise has been so successful that during 1940 building operations were doubling the size of the plant.

Two sweet potato starch factories, producing grades of starch to replace imported tropical root starches, operated profitably at Laurel, Miss., and St. Francisville, La. Output at Laurel rose to nearly 3,500,000 lb. The white potato starch industry in Maine was enlarged.

The still-rising nonfood use of soybeans in industry was indicated by the fact that in 1940 this type of consumption appeared to exceed 15% of a crop of nearly 90,000,000 bu. In 1935 the industrial uses were estimated at 5% of a crop about half the size. Soybean oil consumption in paints increased notably, being stimulated by the rise in tung oil prices. Soybean materials were used in automobile parts, plastics, enamels; printing inks, stearic acid, glycerine, foundry cores and for producing lecithin, among many others.

Chemurgic research on a broad scale was initiated with the opening of the new federal regional research laboratories. Costing about \$2,000,000 each, the laboratories at Philadelphia, Pa., Peoria, Ill., and San Francisco, Calif. were opened during the last half of 1940, while the one at New Orleans approached completion. Congress appropriated \$800,000 annually for their operation.

Corn, wheat and agricultural wastes will be the principal subjects of research at Peoria. Particular attention will be given to the study of motor fuels from farm-grown materials, including anhydrous ethyl alcohol, fermentation gases and the possibilities of starch or other fine dust in engines utilizing the principle of the dust explosion.

Tobacco, apples, milk, potatoes and vegetables will be investigated in the eastern laboratory at Philadelphia. In the western laboratory fruits, vegetables, potatoes, wheat and alfalfa will be studied. Cotton, sweet potatoes and peanuts will be the special subjects at New Orleans. The research of the four laboratories will be carefully co-ordinated with each

other and with the state experiment stations. Around 250 research experts will work at each institution.

Since the regional laboratories are directed by law to confine their work to finding new markets and uses for the surplus crops, plans are under way for supplementing their efforts with another approach to the surplus problem. This is the development of new crops which, by replacing the overproduced crops on substantial acreage, may help to prevent the surpluses from coming into existence. Legislation authorizing an appropriation to create new crop research units at the state experiment stations, and to provide for extensive plant exploration, will be sought during 1941. Advocates point out that of the 15,000 plant species growing in the United States, and of the 250,000 named species in the world, only a few hundred are utilized commercially. It is believed that a survey of plant characteristics, conducted with the resources of the organic chemist and of the plant geneticist in mind, may yield important new crops to add to the American agricultural repertoire, and contribute toward a permanent solution to the aggravating problems of chronic surpluses.

Industrial laboratories reported extended chemurgic types of research during 1940, prompted partly by desire to establish domestic sources of materials and partly by the wish to contribute toward improved farm purchasing power. Some were inspired by economies and successes achieved by other industries.

Indiana added an official chemurgic commission appointed by the governor to those existing in Ohio, Missouri and other states. Illinois organized a state commission with able membership.

State teachers' colleges in Texas and Louisiana continued their chemurgic courses with heightening interest. At Romayor, Texas, the Trinity Valley Chemurgic institute, an independent chemurgic school, was financed and established by local citizens to explore the natural resources of the surrounding area.

The headquarters of the National Farm Chemurgic Council, Inc., the organization devoted to furthering chemurgy in the United States, are at 50 West Broad Tower, Columbus, Ohio.

Chess. What was considered the greatest chess event of 1940 was the U.S.S.R. championship tourney in Moscow when Paul Keres, of Estonia, exhibited a sensational victory over Dr. Max Euwe, of Amsterdam, former champion of the world. In a second title event in Russia, Bondarevsky and Lilienthal shared first honours, scoring 13½ to 5½, the only competitors not to lose a single game. Next came 19-year-old Smyslov, and Keres, fourth. An unexpected upset was the defeat of Levenfisch, one of the old guard, who had hitherto been at or near the top, but who finished next to last in the strong field of 20.

The great American classic, the national chess championship, played in the Hotel Astor, New York City, hailed Sam Reshevsky as the winner for the third time. Though he competed under the handicap of illness, he went through the tourney without losing a game. Paired with Reuben Fine in the last round, the result became a dramatic struggle, with Reshevsky fighting his way to the top.

Of the 20 state championships, the event conducted by the N.Y. State Chess association, at Colgate university, drew a large entry list. Robert Willman led one of the strongest fields in the history of this classic game. Anthony Santasiere and Jack Soudekoff, one point behind the winner, tied for second and third places. The tourney at Ventnor City, N.J., comprising 448 players, finished with a tie, with Sidney Bernstein and Milton Hanauer winning 8 games and losing 3. Fine won the tourney in Utah; Erich Marchand won in Missouri; J. C. Thompson, of Dallas, won in Texas.

The 1940 open tournament of the U.S.C.F. at Dallas was won by Fine with a perfect score of 8-0, with Steiner finishing in second place. The Massachusetts tourney was won by Harlow B. Daly, with Adams and Katz tied for second. R. S. Scrivener won the St. Louis championship with a splendid score of 9 wins, no losses and 2 draws.

Frank J. Marshall, New York's "grand old man of chess," exhibited his skill before an interested audience while competing against some of the strongest local talent, yet he won 19 games, drew 10 and lost 2 games. The Manhattan Chess club won the

STUDENTS OF FOUR eastern U.S. colleges competed in Jan. 1940 for the Belden-Stephens chess trophy. Yale won the tournament

title in the Metropolitan Chess league. In the Commercial Chess league (of N.Y.) the Consolidated Edison team defeated team "A" of the N.Y. Times. Yale emerged triumphant in the annual tournament of the College Chess league, and Brooklyn college led in the Intercollegiate Chess league, winning the Harold M. Phillips Trophy. (J. B. P.)

Chiang Kai-shek (1886—), a native of Feng-haw, Chekiang province, received his education at the Chinese and Japanese military colleges from 1906-10 and gained his military experience as a less prominent follower of Sun Yat-sen in the national revolutionary movement from 1910-22, as a military observer in Soviet Russia in 1923 and as the president of the Whampoa Military academy in 1924.

Chiang became internationally prominent as generalissimo of the Nationalist Northern expedition in 1926. Breaking off relations with the communists Chiang established the National government at Nanking in 1927, and married Mayling Soong (sister of T. V. Soong, the financier) in December of the same year. In 1928 Chiang nominally unified China but the rivalry of the opponents of the Kuomintang and of his colleagues and associates continued. In the name of the central government he crushed these rebellions and, by political counsel and military manoeuvring, won the support of his last important military and political opponents. After the Sian incident of Dec. 1936, Chiang made peace with the communists against whom he had campaigned for approximately ten years.

Since the outbreak of the war with Japan Chiang's leadership has been unquestioned and his popularity has grown. Despite military reverses Chiang has been firm in his policy of resistance and confident of the outcome of the war. Upon his shoulders rest many important military, political, economic and social responsibilities. He is Tsung Tsai (director-general) of the Kuomintang, president of the Kuomintang youth corps, premier, president of the Supreme National Defence council, chairman of the National Military council, commander-in-chief of all the military forces, chairman of the People's Political council, governor of Szechuan province (until Nov. 1940), president of the combined national central banks, promoter of the New Life movement since 1934, director of the movement of the national spiritual mobilization for resistance since 1939, and author of the philosophy of action in 1940. Chiang is regarded as the symbol of a new China and its unity. (See also CHINESE-JAPANESE WAR.)

Chicago, U.S. city, port of entry, county seat of Cook county, Ill., is at the southwest corner of Lake Michigan. It is the second city of the United States in population, manufactures and volume of trade. It is the largest centre of rail traffic and of air traffic and is a port for a great tonnage conveyed by lake ships, principally bulk cargoes of iron ores, fuel, and blast furnace flux. It has access by the Illinois waterway to the inland navigation routes of the Mississippi valley. Small steamers make direct ocean voyages to and from Chicago via the St. Lawrence river and the Welland canal.

The population of the city proper as ascertained in the 1940 U.S. census was 3,396,808, an increase of 20,370 over the population enumerated in 1930. Part of the retarded rate of growth was due to the movement of population to the suburban areas, a continuation of a long-time trend that persisted since 1930 and caused new losses of Chicago's downtown population.

But the rate of suburban growth also showed a decline, and Cook county (in which Chicago is located) had the smallest gain in a century of decennial enumerations. The population of the counties of Lake, Cook, Du Page, Will and Kane, and of Lake county, Indiana, in which most of the population is in the "Chicago metropolitan area," was 4,807,138 according to the 1940 census.

While the decline of Chicago's population growth from 25% in the 1920-30 period to less than 1% from 1930 to 1940 may be attributed in part to the same causes that halted the growth of nearly all the larger U.S. cities, including the movement of population to the south and west, the falling birth rate was also largely responsible. The average Chicago family now is less than three persons, compared to an average of 3.8 for the United States at large and 3.6 for the state of Illinois as a whole. This was reflected in 1940 in a decline of 30,000 in the elementary school enrolment. Nevertheless the number of marriage licences issued in 1940 exceeded all previous records with a total of 44,234.

Business improved steadily in Chicago throughout 1940, reaching unprecedented volumes in the last quarter of the year. To some extent this was a result of government orders under the national defence program. At the end of the year, output of steel in the Chicago metropolitan area was close to capacity, the U.S. Steel corporation's plant at Gary operating at a rate of 99%, highest since wartime output in 1918. Contracts awarded to Chicago industrial concerns by the war department in 1940 aggregated \$232,945,331, by the navy department \$30,755,471.

Revival of building continued in 1940. Residential building, mostly in the outlying parts of the city and the suburbs, provided 4,271 dwelling units in the metropolitan district in the first half of the year, of which 4,098 were single family houses with a valuation of \$23,251,918. Only 34 apartment buildings were erected.

At the close of 1940 the tubes of Chicago's new subway system were 83% completed, with only a small gap under State street unbored. The system was extended in 1940 by provision for 2,000ft. of tubes in Congress street to extend the Dearborn street system, at a cost of \$6,000,000. The city was negotiating in 1940 for a loan of \$53,000,000 from the Reconstruction Finance corporation to equip the tubes with tracks and rolling stock. This loan depends upon settlement of unification negotiations and receivership suits involving the surface street railways, the elevated system and bus lines. After 14 years of litigation, negotiations and engineering surveys, which have cost \$7,000,000, no settlement has been reached.

The tentative budget for Chicago's government, including city corporation, school district, park district, sanitary district, forest preserve district and the public service enterprises, Navy pier, water works and airport, contemplated expenditure of \$163,081,462 for 1941.

PROMINENT FIGURES at the 1940 Democratic convention were Harry L. Hopkins and Mayor Edward J. Kelly of Chicago

In the national election, Chicago in 1940 retained its customary place in the Democratic column. President Franklin D. Roosevelt received 1,029,538 votes to 731,716 for Wendell Willkie, Republican. All Democratic candidates for local, state and national offices received majorities in Chicago, with the exception of the Ninth Congressional district where Charles S. Dewey, Republican, displaced a Democratic congressional incumbent. The Democratic convention was held in Chicago in July 1940.

Although the highest vote in the history of the city was cast, the election was one of the most orderly ever witnessed and there was a minimum of charges of fraud. Gang warfare practically died out in Chicago in 1940. The only notable criminal trials involved evasion of federal income taxes. (L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill., founded in 1891. Privately endowed, the university is co-educational and non-sectarian, although not less than three-fifths of its trustees must be members of Christian churches, and a majority of the three-fifths must be members of Baptist churches.

During the summer quarter, 1940, 4,328 students were enrolled in the university, of whom 2,200 were men and 2,128 were women. The total enrolment for the academic year 1939-40 was 11,674, which was a decrease of 846 from the previous year. The home study (correspondence) department had an average enrolment of 3,725, which is exclusive of the totals given above. The university granted 1,636 degrees during the academic year; 486 were master's degrees and 161 were doctorates of philosophy.

The total funds held by the university as of June 30, 1940, amounted to \$128,536,026, an increase of \$2,700,585 over the same figure for the same date in 1939. These funds were divided as follows: Endowment, \$72,569,187; plant, \$45,411,132; other funds, \$10,555,707.

The total income of the several divisions of the budget was \$8,504,986, an increase over the income of the previous fiscal year of \$129,542. This total of budget income does not include income of auxiliary enterprises such as residence halls, common bookstores, and student social facilities, nor restricted expendable gifts. Including such income, the total current income for 1939-40 was \$10,760,170.

The total amount of gifts paid in was \$1,731,517.

The libraries added approximately 29,489 volumes, raising the total to 1,300,785. President, Robert Maynard Hutchins, LL.D. The university in the academic year of 1940-41 celebrates its 100th anniversary, which will culminate in a four-day festival in Sept. 1941.

Child Labour. The year 1940 marked the end of a decade of progress in the United States in the development of safeguards for employed youth, progress made in the face of industrial depression and emergency situations. During this 10-year period child-labour standards have advanced and child employment has been reduced.

These standards have been raised in individual states from year to year by state legislation and throughout the nation by federal legislation, first by the National Industrial Recovery act, effective 1933 to 1935, and after the year 1938 by the child-labour provisions of the Fair Labor Standards act, which went into effect Oct. 24, 1938. In child-labour legislation the tendency has been toward the establishment of a basic 16-year minimum-age standard of employment, and this standard was set by the statutes of 13 states, including a number of important industrial states. This standard has also been in effect under both federal laws enacted in this decade.

During 1940 there were significant developments in administration of the child-labour provisions of the Fair Labor Standards act, in state child-labour legislation, and in the formulation of standards for certain neglected phases of child labour, such as industrialized agriculture. Standards for child labour and youth employment were approved at the White House Conference on Children in a Democracy held in Jan. 1940, and follow-up conferences in the states have been held with a view to promoting these standards.

Federal Fair Labor Standards Act.—The responsibility for the administration of the child-labour provisions of the Fair Labor Standards act of 1938 is placed in the children's bureau of the United States department of labor. These provisions have the effect of excluding children under 16 years of age from employment in establishments producing goods for shipment in interstate or foreign commerce, except for certain limited employment of children 14 and 15 years of age at work other than manufacturing and mining. In addition, minors 16 and 17 years of age may not be employed in establishments covered by the act in occupations found and declared by the chief of the children's bureau to be hazardous or detrimental to their health or well-being.

The plan of co-operative relationships with state and local education and labour officials in the administration of these provisions was further developed in 1940. This program has had a twofold aspect: first, obtaining voluntary compliance by employers by making certificates of age for young workers available for their protection, and second, working out a system of co-operation with state and local agencies issuing employment certificates under state child-labour laws that would not only provide such certificates but also strengthen the administration of state laws. Standards have been set up for issuing certificates, and state officials have agreed to make certificates of age available in 42 states and the District of Columbia. An advance during the year was the extension of these co-operative plans for making certificates of age available to Puerto Rico and Hawaii. Federal certificates were being issued in four other states with the assistance and close co-operation of state and local officials, and in the two remaining states and in the territory of Alaska negotiations for co-operation are under way. This program stressed the value of reliable evidence of age, particularly of birth certificates, and helped to bring about the use of better techniques by local officials and by state agencies responsible for the administration of state child-labour laws.

The act places upon the children's bureau the duty of determining what occupations are particularly hazardous or detrimental to the health or

well-being of minors 16 and 17 years of age, and after such determination has been made and an order issued an 18-year minimum age is in effect for work in the occupation covered. These determinations are based on a thorough study of available information and upon consultation with experts in industrial safety, employers and employees and on information presented at public hearings. The orders in effect covered occupations in establishments manufacturing explosives or articles containing explosive components (1939), all employment as drivers of motor vehicles or helpers on such vehicles, and all work in or about coal mines, exempting only certain specified surface occupations (1940). Investigation of hazards for young workers are now under way in the logging and lumbering, woodworking and shipbuilding industries.

State Legislation.—In New Jersey, an amended child-labour law established a basic minimum age of 16 years for employment, a maximum 8-hour day and 40-hour week for minors under 18 years of age, and an 18-year age minimum for work in certain hazardous occupations. The minimum age for work in agriculture and in street trades during school hours was set at 16; for work outside school hours, a minimum age of 12 years was set for farm work and for boys in street trades a minimum age of 14, except that boys of 12 years or over may deliver newspapers and magazines on residential routes.

Children in Industrialized Agriculture.—The year 1940 saw an increasing public consciousness of need for better child-labour standards in industrialized agriculture and an increasing awareness of the problems of migratory workers, particularly those employed in large-scale farming operations. Federal and state agencies were seeking solutions for the many problems involved in the migration of workers, particularly of family groups in search of employment. The application of the Fair Labor Standards act to agricultural child labour was extremely limited, and state efforts to regulate the employment of children in industrialized agriculture were few and narrow in their application.

Extent of Child Labour.—The 1940 decennial census should give comprehensive information on the number of employed children and youth in the United States. Until these figures are available, other sources of information must be relied upon.

According to data obtained by the Social Security board in connection with the administration of the Federal Social Security act, the number of workers under 18 years of age receiving taxable wages in 1938 was approximately 730,000. These figures include not only regular workers but also young persons still attending school and having part-time jobs. They do not cover children working in agriculture or in domestic service in private homes.

Information on trends of employment of young persons is found also in figures on the issuance of employment certificates, which are required in many states before children can go to work in industrial or commercial occupations. Reports received by the children's bureau of the U.S. department of labor indicate that the number of children under 16 years of age leaving school for work decreased in 1940 in the face of increasing general employment.

Maintenance of Child-Labour Standards.—A determined effort was being made to maintain labour standards in spite of the need for increased production in the United States for defence purposes. The advisory commission of the Council of National Defense adopted a statement of labour policy which calls for compliance with all federal and state statutes affecting labour.

Child Labour Outside the United States.—In European countries the war brought the development of protective legislation for young workers practically to a standstill and has caused the authorization of exemptions from existing legislation.

In Great Britain, at the beginning of the war in 1939, the effective date of the Education act (1936), which raised the school-leaving age from 14 to 15, was suspended. During the first few months of hostilities many temporary exemptions permitting employment up to 48 hours a week were granted from the provision of the Factories act, which, effective July 1, 1939, had reduced the hours of work of children under 16 years of age to 44 a week. In a number of countries, including France, Germany and Belgium, suspensions of labour legislation, including restrictions on child labour, were authorized.

Nevertheless, it was clear that efforts were being made to avoid the more serious abuses that occurred in the war of 1914-18, and during 1940 a movement to restrict such relaxation of standards was evident.

In Great Britain the number of exemptions from the regulations regarding hours of labour for children under 16 years of age in factories was greatly decreased, and the law reducing hours of work of children under 16 in shops to 44 a week became effective Jan. 1, 1940. Local education authorities were urged by the Home office and by the minister of education to maintain carefully the protection given to children by existing law and to guard against the risk of excessive employment, even at times outside school hours when permitted by law.

In Germany, the authorization to suspend labour laws was restricted by later orders, and in France instructions issued by the ministry of labour recommended the authorities not to take advantage of the extension of the statutory hours of work for young persons except in special cases, and then only temporarily.

Relaxation of standards respecting hours of labour for young workers either by exemptions or through new legislation was taking place in Italy, Rumania, the Soviet Union and Turkey. In Italy, where the legal minimum age is 14, the services of children 13 years of age might be requisitioned for occupations essential to the prosecution of war.

In Switzerland, regulations were issued in Feb. 1940 for the administration of the federal law of 1938, which raised the minimum age for employment of children from 14 to 15 and was to go into operation March 1, 1940. However, this effective date was postponed in 11 of the 22 cantons and in part of a 12th, and even in the areas where the law went into effect permission was given for the granting of exemptions allowing children over 14 years of age to work in factories.

In many countries of Latin America the development of child-labour protection continued along with the rapid development of other child-welfare activities in recent years.

The constitution of Cuba, adopted by convention in June 1940, reaffirmed the child-labour provisions of the existing law, including a 14-year minimum age for employment. A new federal law in Mexico, which unifies the educational system on a national basis, made school attendance compulsory for children up to 15 years of age.

In Brazil, a commission was appointed by the minister of labour to study existing legislation relating to the employment of children and women. A presidential decree also prohibited minors under 18 from engaging in street trades on their own account and established a minimum age of 14 for those working in such trades for an employer. In Chile, the new ministry of labour, established in 1940, contains a special unit for the administration of laws relating to the employment of children and women.

In Canada, the dominion government urged that hours of work should not be unduly extended but that where increased output is desired it should be secured if possible by the adoption of additional shifts. In Quebec an order in council of March 23, 1940, provided for emergency exemptions from the night-work prohibition for women and young persons under 18, on approval of the minister of labour. In Manitoba, the employment in mines or metallurgical works of boys under 16 above ground or of boys under 18 below ground was prohibited.

International Labour Office.—The International Labour office continued to maintain its essential activities despite the war, but in Aug. 1940 its personnel was transferred temporarily to Canada, on account of difficulties of communication and transportation. The only action on any child-labour convention reported during 1940 was the ratification by China in Feb. 1940 of the convention setting a basic minimum age of 15 in industrial undertakings.

Children's Books. Emphasis on biography was continued in 1940. The titles listed first in 1939's report were honoured in June as the two outstanding children's books of 1939. *Abraham Lincoln*, by Ingri and Edgar Parin d'Aulaire, was awarded the Randolph Caldecott medal as the most distinguished picture book, and *Daniel Boone*, by James Daugherty, won the John Newbery award. Among current biographies, *Nansen*, by Anna Gertrude Hall, appeared early. *Introducing Charles Dickens*, by May Lamberton Becker, was the last and one of the best. Others were: *River Boy* (Mark Twain), by Isabel Proudfit; *Wings for Words* (Gutenberg), by Douglas C. McMurtrie; *Early American* (Paul Revere), by Mildred Pace; *Boat Builder* (Robert Fulton), by Clara Ingram Judson; *Elizabeth, the Tudor Princess*, by Marian King; *They Were Good and Strong*, by Robert Lawson. The latter is fully illustrated for picture book age.

A Book for Jennifer, by Alice Dalgleish, is a charming story of John Newbery and his London bookshop which presents welcome subject matter.

Among attractive nature books were: *Children of the Sea*, by Wilfred Bronson; *Animals Nobody Knows*, by Ivan T. Sanderson; *Tale of the Whitefoot Mouse*, by Henry B. Kane; *Presents for Lupe*, by Dorothy Lathrop.

Current fiction included: *Thee, Hannah!*, by Marguerite de Angeli; *Paradise Valley*, by Valenti Angelo; *The Luck of Scotland*, by Iva Bolton; *Buttonwood Island*, by Lavina Davis; *The Sea Is All Around*, by Elizabeth Enright; *River Empire*, by Helen Clarke Fernald and Edwin M. Slocombe; *Blue Willow*, by Doris Gates; *The Fair Adventure*, by Elizabeth Janet Gray; *The Iron Doctor*, by Agnes Danforth Hewes; *Flossie Come Home*, by Eric Knight; *The Year of Jubilo*, by Ruth Sawyer; *Faraway Trail*, by Charlie Simon; *Call It Courage*, by Armstrong Sperry; *The White Isle* (early Britain), by Caroline Dale Snedeker; *The Lone Winter*, by Laura Ingalls Wilder.

The Harper's Daughter (legend of Deirdre), by Michel Alan Buck, and *Heroes of the Kalevala*, by Babette Deutsch, repre-

sented versions of literary classics for young people. Folklore included: *Little Black Hen*, by Eileen O'Faolain; *Piskey Folk*, by Enys Tregarthen; *Happy Times in Czechoslovakia*, by Libushka Bartusek; *Where the Wind Never Blows*, by Padraic Colum; *American Mother Goose*, by Ray Wood; *Peter and the Wolf*, a Russian folk tale by Serge Prokofieff with an orchestral narrative as presented by Serge Koussevitsky and the Boston Symphony Orchestra.

Meeting new interest in the Central and South American republics were: *The Legend of the Palm Tree* (Brazil), by Margarida Estrela Bandeira Duarte, illustrated by Paulo Werneck; *Little Jungle Village* (British Guiana), by JoBesse McElveen Waldeck; *The Cedar Tree* (Guatemala), by Addison Burbank; *Children of the Fiery Mountain* (Guatemala), by Marian Cannon; *Manuelita* (Costa Rica), by Zhenga Gay and Pachita Crespi.

Books of information were numerous. Aviation and vocational subjects were emphasized.

Reading with Children, by Anne Eaton, was an outstanding contribution on children's literature. A very complete *Subject Index to Children's Plays* was published by the American Library association.

In England, the Carnegie medal for the most distinctive children's book of 1939 was awarded to *The Radium Woman* (Madame Curie), by Eleanor Dooley. This was another tribute to biography. (See also LITERARY PRIZES; PUBLISHING.)

(E. L. P.)

Children's Bureau, United States: see CHILD LABOUR; CHILD WELFARE; JUVENILE DELINQUENCY.

Child Welfare. A glance at the child-welfare developments outside the United States in 1940 reveals two outstanding phenomena:

(1) In Europe the devastating effects of the war on children and the disorganization of the activities ordinarily engaged in for children.

(2) In Latin America significant efforts to provide greater safeguards for the young generation.

Child-welfare work in the United States in 1940 received fresh stimulus from the activities of the White House conference on children in a democracy which adopted in Jan. 1940 a general report with recommendations constituting a program in behalf of children for the coming decade. Two committees were appointed to give impetus to the program. A National Citizens committee is giving assistance in organizing state and local follow-up programs. A Federal Interagency committee will serve as a source of information and co-ordinated planning for federal agencies and will co-operate with the National Citizens committee. By Nov. 1940 follow-up programs were definitely under way in 11 states and organization plans were started in other states.

The National Citizens committee issued in June a declaration in relation to child conservation and national defence expressing the conviction that child welfare and national security are inseparable and that the program adopted by the conference will make for national unity and will strengthen the democratic institutions of the country.

The conference publications were being distributed by the children's bureau, United States department of labor, Washington, D.C.

Benefits for children under federal-state programs initiated by the Social Security act of 1935 were extended in 1940. Puerto Rico was given its first federal grants for maternal and child health services, services for crippled children and child-welfare services. In continental United States federal-state programs for maternal and child-health services were expanded; in a fe-

lected areas medical and hospital care were made available for mothers at delivery. Special emphasis was placed on care of premature babies, among whom the death rate is unduly high. With increased federal funds significant progress was made in registration of crippled children and in the extension of medical, hospital and aftercare services. Ten state crippled children's agencies undertook programs for the care of children suffering from heart disease. Federal funds for child-welfare services were being used in all the states to encourage the development of community child-welfare programs, and local child-welfare workers were being employed in 522 counties or local areas to give service to homeless, dependent and neglected children, and children in danger of becoming delinquent. There were still many children, dependent according to federal definitions, who were not receiving in 1940 the benefits of federal aid either because of inadequate state appropriations or in seven states and Alaska because provision had not yet been made for co-operation with the federal government under the program for aid to dependent children.

In the fiscal year ended June 30, 1940, federal funds were paid to states under Title V of the Social Security act as follows: for maternal and child-health services, \$4,823,207; for services for crippled children, \$3,378,986; for child-welfare services, \$1,497,074. Under Title IV of the act: For aid to dependent children, \$46,113,458. State and local funds for these purposes were also made available.

There were 2,265,588 live births in the United States in the calendar year 1939. The birth rate (17.3 per 1,000 population) was slightly lower than that for 1938 (17.6). Maternal and infant mortality rates in the United States, reflecting improved maternal and child care, continued to decline. The maternal mortality for 1939 was 40 deaths from puerperal causes per 10,000 live births, a reduction of 9% as compared with the 1938 rate (44). The 1939 infant mortality rate, 48 deaths of infants per 1,000 live births, was 6% less than the 1938 rate (51).

An order adopted by the commissioner of immigration and naturalization with the approval of the attorney general of the United States provides simplified procedure for the admission to the United States of children seeking refuge from the dangers of war. Children admitted under the auspices of non-profit corporations, according to the order, must be assured of reception, placement and care in conformity with the standards of the United States children's bureau. The bureau was maintaining a central register of all children coming to the United States unaccompanied by or not coming to both parents.

Great Britain and Europe.—In the countries at war, so far as can be assumed from the limited information available, evacuation of children from zones exposed to air raids to less dangerous localities constituted a major problem. In England evacuation of children from London, begun in 1939, continued on a voluntary basis. Parents able to pay for the care of their children were asked to do so; in other cases the government paid a specified amount. However, many parents hesitated to part with their children. The British dominions offered to take children either for the duration of the war or on a permanent basis and many children were evacuated to the dominions. In the United States the children's bureau of the department of labor co-operated with the department of justice and the United States committee for the care of European children in developing and carrying out plans for the care of children coming to the United States.

Early in October the British government decided that evacuation overseas should be suspended because of the risks of transportation. By the end of Oct. 1940, 563,000 children had been moved from the London area to other parts of Great Britain and overseas but 279,000 still remained there. In Germany, evacuation of children from Berlin was begun in Oct. 1940, but no details were available because of censorship restrictions.

The war left its mark on school attendance. Many schools were closed under the threat of air raids, or because of mobilization of many teachers, or use of school buildings for military purposes. In England in the cities subject to air raids and in other localities only a part of the children were attending school. It was reported in Feb. 1940 that out of 12,500,000 children in London and other danger areas 400,000 were getting no schooling. According to an official estimate three-fourths of the 92,000 school children remaining in London in Dec. 1940 were not going to

school. Truant officers were appointed for the enforcement of attendance. Disorganization of the medical services for children because of the mobilization of physicians and nurses was reported from England. Elsewhere, even in the neutral countries of Europe, welfare work for children was greatly curtailed.

Japan.—To compensate low-paid workers with children for the increased cost of living the government of Japan ordered in 1940 the payment of family allowances to workers in private and public service whose earnings are below a specified amount and who have one or more dependent children under 14.

Netherlands.—In the Netherlands a law for a similar purpose enacted late in 1939 was to become effective in 1940. Allowances were to be paid for each child under 15 beginning with the third. The cost of the plan in both countries was to be borne by the employers.

Spain.—In Spain several thousand orphans of the civil war of 1936-38 were made wards of the state, a measure similar to those taken by France and Italy in 1917 with regard to the orphans of the war of 1914-18. These children who heretofore were dependent on public charity or had to shift for themselves will be placed in foster homes or institutions under the supervision of a special board.

Latin America.—In most countries of Latin America child-welfare activities continued in 1940 to make substantial progress. A desire for United States guidance and co-operation was manifest. Co-ordination of all work for children under one national agency took place in Brazil with the creation of the National Children's bureau. This bureau will co-ordinate and supervise all services for mothers and children and administer federal aid to the states and municipalities for building and helping to maintain maternity homes, children's hospitals, prenatal and child-health centres, and other institutions. In Chile a central bureau for the medical-social protection of the mother and child was organized. All work done for children by the departments of health, education and justice was placed in the charge of this bureau. A bill for the establishment of a supreme council of maternal and child welfare was pending in Chile.

The problem of nutrition received much attention in Latin America. In Brazil a plan was prepared for the establishment of a nutrition service to promote better food habits among the working people throughout the country and to further the provision of an adequate food supply at reasonable prices. The establishment of a government bureau with similar functions was ordered in Peru. In Colombia, Costa Rica and Guatemala national committees or councils were appointed to study the food habits of the people and methods for their improvement.

In Uruguay under a law passed early in 1940 every employer giving out work to be done in the worker's home must keep a register stating the worker's name, residence, nature of the work, number of pieces of work with the dates of issuing and delivering, and the amount of the worker's pay. Similar information must be kept by the worker. Minimum wages will be determined by committees to be instituted for that purpose. The national bureau of labour must keep a list of persons engaged in industrial home work. Industrial home work is not permitted in dwellings occupied by persons with contagious disease.

Social insurance continued to make progress in Latin America. Insurance against the risks of illness, maternity and industrial accidents and diseases was made compulsory in Venezuela for persons employed in commerce and industry with earnings below a specified amount. In case of illness the insured person and members of his family are entitled to medical and surgical care and medicines. A daily cash benefit is paid in case of incapacity for work. The maternity benefits consist of obstetrical care and cash payments for six weeks before childbirth and six weeks afterwards. A bill providing various forms of social insurance, among them maternity insurance, was pending in the federal congress of Mexico in 1940. In Cuba a bill for the reorganization of compulsory maternity insurance instituted in 1937 for employed women and another for the introduction of compulsory insurance against sickness for all workers passed the lower house of congress.

Provision for health services, day nurseries, kindergartens and vocational schools is included in a federal law in Mexico which unifies the educational system on a national basis.

Registration of births was made compulsory in Venezuela for the purpose of instituting supervision over the health of newborn children as early as possible and for teaching the mothers infant care. The physicians or midwives attending births and, in cases of unattended births, the fathers or other relatives must report the births within three days.

In Cuba a convention of specially elected delegates of the people adopted a new constitution which is the first in that country to authorize specifically an extensive program of family welfare services, public education and protection of labour. The enactment of this program into law within a specified period is made mandatory by the constitution.

Paraguay, too, has a new constitution. Although of lesser social import than that of Cuba, it is more advanced than the constitution of 1870 which it has replaced. Among the fundamental duties of the state, the constitution names social aid, care of the population's health and education of young people. (See also CHILD LABOUR: SOCIAL SECURITY.)

(K. F. L.)

Chile, a republic on the west coast of South America, extending some 2,800 mi. from just within the tropics to the subarctic south; language, Spanish; capital, Santiago; president, Pedro Aguirre Cerda. The area is 289,776 sq. mi. The population (Nov. 28, 1940 census) is 5,000,782. Santiago has a population of 875,790 (Jan. 1, 1940 official estimate); other important cities (1939 est. pop.) are: Valparaiso, the principal port, 263,228; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458.

History.—Chilean internal political history during 1940 was concerned, in the main, with partisan political activities, in which, usually, the popular front (government) coalition of Radicals, *Demócratas*, Socialists, communists and other minor leftist groups was pitted against a rightist opposition embracing the Conservative, Liberal, *Democrático* and lesser parties. Jorge González von Marées' Popular Socialist vanguard (formerly the Chilean nazi party), which, although not part of the popular front, had supported its ticket in the 1938 presidential elections, played a lone hand, with the violent fervour and fanaticism of its members making up for lack of numbers. Other independent groups included the fascist nationalists.

Despite the weaknesses inherent in coalition, the popular front administration of Pres. Aguirre struggled through the year against the rightist-controlled congress as well as against internal frictions, which brought about, in the course of the year, frequent shifts in cabinet personnel. The first, in February, resulted from a scandal arising from the sale, by Chilean consuls in Europe, of false passports to Jewish refugees, and a newspaper strike which left Santiago without newspapers for three days, and precipitated the resignations of six radical ministers. Continued strikes brought an increasing opposition from more moderate government supporters, particularly Pres. Aguirre's fellow radicals, and in June the president formally urged employers and employees to refrain from lockouts and strikes.

Anti-communist feeling mounted during 1940, and in November, legislation outlawing the party was approved by the chamber of deputies. Vigorous attacks on the communist party were made by Socialist leaders in December, notably by Minister of Development Oscar Schnake, who had just returned from a mission in the United States. Schnake, one of Chile's strongest political figures, and former president Marmaduque Grove, another leading Socialist, urged a Pan-American front against all totalitarian ideologies. Pres. Aguirre congratulated Schnake, but other radical leaders defended the communists as loyal members of the popular front.

Meanwhile, on Nov. 18, the popular front won its 15th consecutive by-election in less than two years. Voting, however, was seriously marred by disorders, and the election had far-reaching consequences, as the rightist-controlled congress impeached Interior Minister Guillermo Labarca and forced his removal for failure to preserve order. The parties of the right followed this by announcing refusal to participate in the regular congressional elections of March 1941, declaring the government gave the opposition no protection. Announcement by the new interior minister, Arturo Olavarria, upon taking office Dec. 23, that no strikes would be permitted to extend beyond ten days and all agricultural strikes would be barred until after harvest, coupled with his determined stand against non-governmental armed groups, whether of right or of left, coming as it did with the anti-communist drive, was regarded by many as indicating the imminent collapse of the popular front.

Fifth-column activities of German residents and German-descended citizens in Chile received wide attention both at home and abroad, amid charges that from \$50,000 to \$100,000 was being spent monthly on nazi propaganda. Many Chileans expressed alarm over extensive foreign, especially German, ownership of land along the border in southern Chile. The Socialist party, however, protested a government decree of Aug. 17 giving the national police power to deal with "professional agitators." In the last months of 1940 the vanguard and other agitator groups were especially active. Nevertheless, in view of the strength of Chilean national feeling, some foreign observers were inclined to regard the extent of "fifth columnism" as somewhat exaggerated.

To cope with unsatisfactory internal political and economic conditions resulting from the European war, a presidential decree

of June 3 set up strict control of copper, iron, scrap iron, and livestock exports, along with measures to speed up agricultural and industrial production. Serious shortage of dollar exchange, alleviated by a \$12,000,000 United States Export and Import bank credit in July, was again so acute that bond amortization payments were temporarily suspended on Dec. 3.

Especially after June, Chile undertook strong defence measures with emphasis on aviation. A 9,000,000 peso appropriation for army training planes was made; 12 combat planes were purchased, and a 600,000,000 peso development of air defence facilities begun. Reports of United States negotiations for naval basing rights in Chile as part of its hemisphere defence program brought a quite unfavourable reaction, owing to feared infringement upon national sovereignty.

Chilean international relations during 1940 were concerned principally with Spain, the European belligerents, western hemisphere defence and territorial questions with Argentina. Only the Spanish question became an internal political issue. Relations with Spain, strained ever since the advent of the Franco regime to power, became increasingly tense in Jan. 1940, owing to Franco's demands that several Spanish Republicans, refugees in the Chilean embassy in Madrid, be surrendered to his government, and on July 17 (on the eve of the Havana conference) Spain suddenly broke off diplomatic relations. Chilean interests in Spain were handled by Brazil until, on Oct. 12, Spain made a unilateral announcement of resumption of relations.

Several incidents during the year served to irritate relations with Germany. German protests in January against the film *Nurse Edith Cavell* forced deletion of several objectionable features. Subsequent protests against continued recognition of Polish, Danish and Norwegian diplomatic representatives were rejected, while arrest of four seamen from the German battleship "Graf Spee," who had escaped from internment in Argentina, caused the expulsion of the German consul at Valparaíso, who had provided them with false passports.

The Chilean government, on the whole, maintained a rigorous neutrality toward the European war, refusing (Jan. 18) to adhere to a joint Pan-American protest against Russia's invasion of Finland. The rightist senate, however, passed a resolution condemning invasion of neutral countries (May 15). The administration itself was loath to take any stand, and at the Havana conference opposed the proposed protectorate over European possessions in America as "premature" (see *HISPANIC AMERICA AND THE EUROPEAN WAR*). Relations with the United States were generally quite friendly, however.

The Beagle channel boundary dispute with Argentina (involving title to Picton, Nueva and Lennox islands), whose arbitration procedure itself became the subject of disagreement, was resubmitted to United States arbitration in May. A further dispute was in the offing as a result of formal Chilean assertion of rights over all of Antarctica between 53° and 90° W. long., which potentially affected Argentine, British, Norwegian and United States claims.

Education.—Primary education is free, non-sectarian and compulsory. Chile had in 1940 more than 3,504 public primary (1932 enrolment, 460,715) and 820 private primary schools (enrolment 97,177); and 85 secondary (including the military and naval schools) and 119 special schools. There are four universities: the National at Santiago, two private and one parochial, with 7,000 students. The National university summer session (1940 enrolment, nearly 1,000), held each January, is a mecca for students from all parts of America.

Army and Navy.—Chile has an army of 40,913, with reserves of 212,000 and an air force of 100 planes (aviation personnel 2,962). In Aug. 1940, 200 bombing, pursuit and training planes were ordered as part of the defence improvement program. The

ivy is one of South America's strongest. There are two naval bases: Talcahuano (the more important) and Viña del Mar.

Finances.—The monetary unit is the peso, with an officially controlled value of 5.18 cents U.S. In the open market, however, fluctuated in terms of the dollar from 2.7 cents to 3.4 cents during 1940. For foreign trade statistics, the gold peso (equal to 1/3 gold, or 20.6 cents U.S.) is used. The total foreign debt (Dec. 1940) was approximately \$306,505,026, of which \$170,208,500 was in dollar bonds, \$111,049,884 in sterling and \$25,246,642 in Swiss francs. All were in default, but during 1940, \$6,215,500 was applied against the dollar debt under amortization arrangements suspended on Dec. 3. The 1941 budget anticipated receipts of 909,750,359 pesos and expenditures of 1,909,502,618 pesos.

Trade and Communication.—Chile has extensive steamship connections with all parts of the world, including direct service under the Chilean flag to New York, to Guayaquil and to the east coast of South America (by way of Magellan strait). Air transport service to all parts of America is provided by Pan American Airways and its affiliates, with three direct connections weekly to and from New York. Air transport to Europe, through Argentina and Brazil, was formerly maintained by a German line (suspended Sept. 1939) and a French line, which ceased operations in 1940. The former resumed flights in March 1940, but discontinued in September. There is railway communication to Bolivia from the northern ports of Arica and Antofagasta. Under the new trans-continental railway project begun in 1940, the former was to be Pacific terminus of an Arica to Santos (Brazil) railway. (See BOLIVIA.) Rail-bus service to Argentina is through the Transandine railway route and by way of Bariloche in the south.

Internal communication is by rail, coastwise shipping, air and highway. The state-owned railway system extends south to Puerto Montt, with a narrow-gauge line on the island of Chiloé. A total of 8,387 km. of railway was in operation in 1940. During the year, new equipment of German manufacture (purchased before Sept. 1939) was brought through the British blockade with special permission of the British government. Orders for further equipment were placed in the United States.

Communication to the far south is by air (via Argentina) and by boat. Internal air transport is well developed under a state-owned system, with routes nearly 5,000 km. in length. The highway system, over 23,000 mi. in length, including 9,500 mi. of improved highway, is being rapidly developed, although it is inadequate as yet. The Chilean merchant marine, officered and manned by Chileans, is the largest and best developed in Hispanic America.

Chile's foreign trade in 1939 declined 8.7% from that of 1938. Imports of 410,832,800 gold pesos were 17.7% less, exports of 71,365,000 gold pesos, 2.1%. Imports (with textiles, machinery, chemicals, metal products, foodstuffs and miscellaneous manufactures leading) came largely from the United States (31.1%); Germany (22.7%); Great Britain (8.3%); Peru (7.5%); Argentina (4.4%); Italy (3.9%); Japan (3.8%); France (2.3%), with proportions to each substantially the same as in 1938. Exports were taken chiefly by the United States, 30.5% (1938: 15.7%); Great Britain, 12.3% (1938: 21.8%); Germany, 8.4% (1938: 5.0%); France, 4.7% (1938: 4.5%); Sweden, 4.6% (1938: 1.1%); Belgium, 4.5% (1938: 7.8%); Italy, 3.7% (1938: 4%).

In 1939, copper aggregated 49.3% of all export values; nitrate, 8.9% (48.2% and 20.7% in 1938). Nitrate exports in 1940 were expected to be double the 1939 volume. Copper exports nearly doubled in the first eight months of 1940. Entry of Italy, a heavy customer, into the war, and lack of transportation facilities were believed to have materially reduced the total before the end of the year, although considerable "back door" copper export to Germany was carried on through Japan.

In the first eight months of 1940 imports were 318,958,000 gold pesos (a 15.85% increase over 1939), with 47% from the United States (1939: 28.5%); Great Britain, 9.0% (1939: 8.6%); Peru, 8% (1939: 7.05%); Argentina, 5.95% (1939: 4.22%); and Germany, 4.6% (1939: 26.6%). Exports were 517,764,300 gold pesos (a 9.2% increase), 57.1% going to the United States (1939: 16.6%); Great Britain, 6.75% (1939: 18.65%); Italy, 4.0% (1939: 3.24%); Japan, 3.44% (1939: 1.55%); and Argentina, 2.32% (1939: 1.78%), following in order.

Agriculture and Mining.—Copper is the most important mineral product, with nitrates second. These two are the major export commodities, with production dependent upon export demand. Copper production in 1939 was 339,173 tons, 3.5% less than in 1938, but rose nearly 20% in the first eight months of 1940. Nitrate production (1,445,999 tons in 1939) rose nearly 7%. Other 1939 mineral production included iron, 1,625,622 tons; coal, 1,882,206 tons; gold, 10,110 kgs.; silver, 36,517 kgs. In 1940, 64,700 persons were engaged in mining.

Although minerals are the chief exports, agriculture is the principal industry, with most of its products mainly for domestic consumption. Wheat and fruits are the principal commodities. Chilean wine is becoming increasingly important.

The pastoral industry has increased notably in recent years, with its centre in the far south, where sheep are extensively raised. Wool exports are important.

Manufacturing.—Manufacturing is insufficient for domestic demands, but increased rapidly as a result of the European war's disruption of normal external trade channels. In the first eight months of 1940 the industrial production average was 12% more than that for the corresponding period in 1939. The most marked increases were in the output of glass, cement, matches, clothing and paper, whose domestic production averaged almost 50% higher than in 1939. From the point of view of employment, public utility services, foodstuffs, paper manufacturing and metal work are the most important industries.

BIBLIOGRAPHY.—Dirección general de estadística, *Estadística chilena* (Santiago, monthly). (L. W. BE.; H. J. T.)

China, an ancient nation but a young republic, constituted, before the Manchurian crisis in Sept. 1931, an empire of 4,480,992 sq. mi. with a population of approximately 450,000,000. According to the final draft of the constitution promulgated in May 1936, China consisted of 28 provinces, Outer Mongolia and Tibet. Excluding Outer Mongolia, Tibet proper and Manchuria, over which China has *de jure* but not *de facto* control, China has an area of 2,903,475 sq. mi. with a population of some 400,000,000. Since 1933, Japan has created Manchukuo out of the provinces of Manchuria and Jehol. Since July 1937, Japan has penetrated 15 of the 28 provinces, viz., Hop-eh, Shantung, Shansi, Kiangsu, Suiyuan, Chahar, Anhwei, Hupeh, Fukien, Chekiang, Kiangsi, Hunan, Kwangtung, Honan and Kwangsi, but in Oct. 1940 withdrew its troops from Kwangsi and its occupation of the 14 provinces is far from complete. The occupied territories, including the special zones of North China and Inner Mongolia, are supposed to be administered by Wang Ching-wei's government at Nanking. Amoy and Hainan were in 1940 directly controlled by Japan.

In addition to the unoccupied area of the 14 provinces, 10 provinces, viz., Yunnan, Szechuan, Shensi, Kansu, Sikang, Chinghai, Ningxia, Kweichow, Sinkiang and Kwangsi, were in 1940 exclusively subject to the National government of China with its capital at Chungking. This area, currently termed "Free China," includes one of China's richest agricultural and productive salt well regions, and contains large deposits of coal, the bulk of China's resources of manganese, copper, lead, zinc, tungsten, antimony and tin, plus some gold and silver. The important iron, coal and

salt deposits and cotton and wool producing areas are in the northern provinces which Japan seeks to control.

Government and Politics.—China was ruled by dynasties prior to the founding of the Chinese republic in 1911. The republic has had a checkered history, and from 1927–37 China was ruled by one party, the Kuomintang. Since the war with Japan the minor parties, communist, Social Democratic, National Socialist, Young China, National Salvationists and Third party, have gained their legal status and a voice in the government.

The National government derives its mandate from the central executive and central supervisory committees of the Kuomintang, but the actual governmental functions are carried on by five independent departments or Yuan: executive, legislative, judicial, control and examination. The Central Political council, the highest political organ of the government in peacetime, formed a link between the Kuomintang and the government, but since Feb. 1939 the Supreme National Defence council has taken over all its peacetime functions and assumed emergency powers. Independent of the five Yuan, but subordinate to the National government, is the National Military council whose chairman, General Chiang, has the power to declare war, make peace and conclude treaties. The People's Political council, created in 1938, which had the power to make proposals to and inquiries of the government, and which formerly consisted of 200 members appointed by the Kuomintang, is, according to the announcement of Sept. 25, 1940, to be increased to 220 members, of which 90 are to be elected by the provincial and municipal political councils. The National People's congress scheduled for Nov. 12, 1940, to adopt the permanent constitution, was postponed, but limited legislative powers are given to the People's Political council, making it a more representative body during the war. Lin Sen, president of China, was in 1940 titular head of the government. (See CHIANG KAI-SHEK.)

Army.—The modern Chinese army, which dates its origin to the Nationalist army of 1925, has been an important factor in China's national life. In 1937 all of the military forces were subordinated to the National government, and at the outbreak of the

war with Japan China had about 2,000,000 soldiers, with 1 trained reserves. The system of centrally directed conscription and training did not begin until 1937. In 1940 the regular army, the guerrillas, and the partisan fighters consisted of about 2,500,000. About an equal number were serving in the militia. Due to the historical development and different military tactics China's army consisted in 1940 of two distinct groups: the Kuomintang armies, including the Central army, the Kwangsi and other provincial troops, and the Red army consisting of the Eighth Route army and the New Fourth army. The Central army and Kwangsi troops were better equipped for positional warfare, while the Red army was known for its mobile tactics. The National Military council is the highest organ of the army which constituted in 1940 about 200 divisions. These divisions were organized into 50 armies.

Education and Religion.—Illiteracy is high, but steady progress has been made. It was recently estimated that out of 450,000,000 only 90,000,000 are literate and that adult illiterates number 140,000,000. In April 1940, the ministry of education adopted a five-year plan for adult illiterates. The total number of the children of primary school age is about 45,000,000, but only 44,000,000 (19,800,000) are in school. Before the war there were about 29,000 primary schools, of which one-third were forced to close because of the war. In 1940 there were approximately 200,000 primary schools and the ministry of education planned to increase the number to 800,000 within the five-year period (1940–44). Of the 3,264 high schools in China, about 40% (1,296) were in the occupied areas. The institutions of higher education have been severely crippled by the war. Out of a total of 108 colleges, 14 have been either occupied or damaged and 14 have been completely destroyed. China saved 91 and moved 77 to a safe area and four new ones were established. Special vocational schools were created to train administrative and technical personnel for local administration and rural rehabilitation. Moral education which is based upon Confucian virtues and the three principles of the people, is emphasized.

The Chinese are eclectic and the average Chinese is influenced by Confucianism, Buddhism and Taoism. There were in 1940 approximately 1,000,000 Protestants, 2,000,000 Catholics and 48,000,000 Mohammedans in China.

Finance and Banking.—An agricultural economy, the loss of territory and the problem of national currency and international exchange have made China's financial problem exceedingly difficult. The 1940 budget was expected to be much higher than the announced budget of 2,850,000,000 yuan of 1939, which was 75,000,000 yuan over the budget of 1937. China's chief sources of revenue had been the maritime customs, the salt monopoly and consolidated taxes, but Japanese occupation of seaports, salt producing centres and industrial areas has deprived China of much of these. China's revenue since 1938 is estimated at 100,000,000 yuan per month, approximately one-half her expenditures. No taxes on income, inheritance and war excess profits have been levied, but with slight success. The government has issued bonds and negotiated loans to meet the deficit. Up to July 1940, the domestic loans floated since July 1937 amounted to 3,430,000,000 yuan; 100,000,000 custom gold units; £20,000,000 sterling and U.S. \$100,000,000. The largest foreign credit up to 1940 came from soviet Russia and amounted to \$200,000,000–\$250,000,000. The United States advanced \$25,000,000 in Dec. 1938, \$20,000,000 in March, \$25,000,000 in September and \$100,000,000 in November of 1940. In 1939 Great Britain extended £5,000,000, and £10,000,000 in Dec. 1940, for currency stabilization.

WANG CHING-WEI (front row, centre) and members of his Japanese-dominated government. Wang set up his puppet rule at Nanking March 30, 1940, and pledged assistance to Tokyo in trying to "restore peace" to China.

At the beginning of the war with Japan, China had a stable currency with the yuan at 30 U.S. cents. Shortly after the outbreak of hostilities the Chinese dollar declined until May 1940, when it reached 4.65 cents. In early December it had recovered to 6.10 cents. The four government banks have issued and circulated notes, fully backed by cash reserves and securities, totaling 1,407,202,334 yuan in June 1937, and increased to 3,962,144,205 yuan by June 1940. Prices have risen five- to eightfold because of the disruption of transport facilities, expensive means of transport, general shortage of certain commodities, hoarding and currency depreciation.

Trade, Transportation and Economic Development.—China has always had a heavy import surplus. China's receipts from other services and exports are not sufficient to counterbalance the combined total of the import surplus and of interest payments abroad. Its principal export articles are: silk, tea, wood-oil, bristles, hides, eggs and egg products, tungsten, antimony, tin and handicraft goods, and her principal imports are manufactured goods, machinery, chemical products and war supplies. In 1937 China's import excess was about 115,000,000 yuan, and 2,411,000,000 yuan in 1939. The excess imports between January and July of 1940 were 93,684,000 as against 349,612,000 yuan in the same period of 1939. If the volume of trade in "Free China" is separated from that of the occupied area, an increase in the volume of import trade is observed in the occupied area because of the loss of ports. In "Free China" there has been an export surplus. In order to conserve foreign exchange the National government adopted measures to promote production, encourage exportation and restrict certain imports.

To facilitate exports and the importation of war supplies China completed, since 1937, the Burma road, the Turkistan-Siberian road and some 5,700km. of new highways in the interior. Japanese occupation has deprived the National government of about 7,300km. of railway, but China has undertaken the construction of approximately 7,000km. of railway. Because of financial and economic difficulties, only about 600 km. have been completed. Progress has also been made in commercial aviation, telegraph and telephone in "Free China." China's coastal and river shipping was practically wiped out by the war. China has no transoceanic shipping line.

Despite difficulties, the National government carried on its program of developing heavy industries in the rear. More than 472 factories have been moved from the coastal provinces to Szechuan, Yunnan and Kweichow. The ministry of economic affairs has constructed mining and metallurgical industries, machinery and electrical industries, chemical industries, spinning mills and power plants. To improve agricultural production of essential goods the National government allocated from June 1939 to Feb. 1940, 151,000,000 yuan for loans to the farmers of "Free China," and rural co-operatives are being organized on a large scale in order to improve agricultural methods and production.

Destruction of Chinese industrial equipment, blocking of China from foreign trade sources and encouragement of Japanese exports to Chinese markets gave incentive to the organization of industrial co-operatives. In July 1938, the National government inaugurated the industrial co-operatives initiated by both Chinese and foreigners by granting them an initial capital of 5,000,000 yuan. They aimed to establish 3,000 producers' co-operatives in the interior. In April 1940, the number of organizations exceeded 1,500. These are organized around some 60 depots in about 16 provinces. The central headquarters is at Chungking and the staff of 700 is financed by government funds. The co-operatives were employing in 1940 more than 25,000 members with a monthly turnover of about 600,000 yuan. They represented over 100

trades and produced 250 different commodities: from boots to boats and candles to light bulbs. The development of the industrial co-operative is one of the important features of China's war economy. (See also CHINESE-JAPANESE WAR.)

Chinese-Japanese War. The Chinese-Japanese war which began on July 7, 1937, entered its fourth year. The immediate cause which set the spark to one of history's most brutal dramas was a night skirmish near the Marco Polo bridge on the outskirts of Peking, capital of dead dynasties and old governments of China. The fundamental forces motivating the war were patent in the "Manchurian incident" of Sept. 18, 1931; viz., the culmination of the struggle between Chinese nationalism and Japan's policy of expansion, and the beginning of an open conflict between the assertion of Japanese hegemony in eastern Asia and the struggle of the western democracies to maintain the *status quo* in that area. In terms of destruction of life and property and of suffering, the Chinese-Japanese war was by the end of 1940 already comparable to the war of 1914-18 and the end was not in sight. After the Japanese invasion of French Indo-China in Sept. 1940 and the signing of the Berlin-Rome-Tokyo tripartite alliance in the same month, the international character of the Chinese-Japanese war became more obvious, and the outcome and course of the Chinese-Japanese war and the European war seemed interdependent.

Military Operations.—The Chinese divide the military developments of the war into three stages: Japanese offensive and Chinese defensive; guerrilla warfare and stalemate; Chinese counteroffensive and Japanese retrograde movement. The first stage of Japanese offensive and Chinese defensive can be divided into three periods. Each of the three periods of the first stage was marked by the fall of a strategic city: Nanking in Dec. 1937; Hsuehowfu in May 1938; Hankow in Oct. 1938. With the fall of Hankow General Chiang Kai-shek adopted general guerrilla warfare against Japan. This marked the beginning of the second stage of the war in 1940.

The Japanese fundamental objective was either to annihilate China by taking her nerve centres and dealing a deathblow to her army or to strangle China by cutting her off from the outside world and dividing her internally. The Chinese fundamental objective was to defend the important and strategic cities as long as possible in order to make the Japanese advance costly and to gain time by losing area. Thus it was to Japan's advantage to win a decisive and swift war, whereas China's hope lay in a war of attrition. During 1940 China's chief objective was to prevent Japanese consolidation and control of China by political means and to prevent Japan from conquering China by the use of Chinese resources. Japan's main objectives were to consolidate her economic and political gains, to harass Chinese forces, to bomb Chinese bases and lines of communication and to tighten the blockade. From the fall of Hankow to Dec. 1939, Japan succeeded in taking only two important inland towns, Nan-Chang and Nanning. Off the southwestern coast of China, Japan occupied the minor ports of Hai-Chow, Weichow and Swatow and Hainan and the Spratley islands. Japan failed to control Shansi, to strike at Ningsia and the Russian-China supply line through Lanchow and to secure complete control of the Chang-chow-Hankow and Canton-Hankow railways. Japan suffered a major setback in her drive to Chang-sha in Oct. 1939. It was estimated

that in the first year of war Japan penetrated China to a depth of over 1,000 mi.; in the second year, about 200 mi.; and in the third year, only slightly over 100 mi. During 1940 China recaptured many towns from the Japanese.

Through the year 1940 the military situation was largely a deadlock and neither Japan nor China was able to force a definite conclusion on its own terms. Because of her southward move and of the economic strain of the war, Japan was more anxious to conclude the conflict than China, and the failure to settle the "China incident" was the chief cause of the frequent changes of governments in Japan. Since the beginning of the war the Japanese cabinet changed five times. In order to establish the "new order" in "greater east Asia" Premier Konoye created the New National structure which penetrated every aspect of national life and was designed to give Japan the strength of totalitarian organization without the machinery of single party rule. On the other hand, the Chinese united front was maintained and strengthened in order to continue the policy of continued resistance.

Chinese and Japanese military objectives and tactics remained unchanged through 1940. There were many engagements on three main fronts: the northern front, including the five northern provinces; the central front, covering part of Hupeh, Hunan, Kiangsi, Chekiang and Kiang-su; the southern front running through parts of Kwangtung and Kwangsi. On the northern front Japan continued her offensive in Shansi and Suiyuan with the purpose of invading Ningsia, Kansu and Chinghai via the southern half of Suiyuan, in order to establish a puppet government in Inner Mongolia and to cut off the routes between China and soviet Russia. In Jan. 1940, Japan took the strategic city of Wu-yuan and reached the border of Ningsia, but in March China recaptured Wu-yuan, forcing Japan to retreat to Paotow. At the end of April Chinese troops forced their way into part of Kai-fêng, Honan province, but they were immediately driven out. Taking advantage of Japanese concentration of troops in the

south, the Chinese prepared a counteroffensive in July. With co-operation of the peasants the guerrillas mobilized about 100,000 men to attack the Japanese lines. In August they succeeded in cutting north China's main communication lines, in annihilating Japanese outposts and garrisons along the communication arteries, and in preventing Japan from concentrating her force for major operations on the northern front.

Having failed in the drive on the northern front, Japan launched a big offensive on the central front in May 1940 with the purpose of destroying the strong Chinese forces concentrated in the upper Yangtze valley, cutting off the Chinese connection between north and south China and either crushing the national government, reducing it to the status of a local regime in southwestern China. In June pitched battles were fought around Siang-Yang and Ichang, the gateway to eastern Szechuan from Hupeh, and casualties were heavy on both sides. Japan's attempt to surround and destroy the Chinese armies was unsuccessful but she succeeded in capturing two exceptionally valuable strategical cities, Ichang and Shasi, toward the end of June. Ichang is about 240 mi. closer to Chungking than is Hankow, the base for all former air raids on the wartime capital, and from May to November Chungking was constantly subject to intensive air raids. Toward the end of November Japan's Hupeh offensive met another setback. There were indications that the Japanese forces in central China would have to withdraw from a number of advanced positions to their main bases of concentration.

On the southern front, after taking Nanning in Nov. 1939, Japan began to drive toward northern Kwangtung and Kwangsi with a view to penetrate Yunnan and block China's access to India, China and Burma and to prepare a military base against the French colony. In Feb. 1940 the Japanese offensive in northern Kwangtung failed with heavy casualties. In the middle of February China recaptured Pinyang, the northernmost Japanese outpost in Kwangsi. The occupation of Nanning not only cut one

China's wartime supply routes but also provided Japan with a closer base from which to bomb the Indo-China Yunnan railway, and from January to June the Chinese section of the railway was repeatedly bombed despite the promise of the French government to stop the Chinese from shipping munitions by that line. In June, during the Nazi attack on Paris, Japan brought pressure on France and Britain to close China's international trade routes. Japan's attempts to cut China's international lines of trade and supply were more successful than her military offensives.

Japan's design on Indo-China was first regarded as the attempt to attack Yunnan through the Indo-China Yunnan railway, but subsequent military operations in Indo-China indicated it to be a prelude to southward expansion. Because of the desolate mountains, it was difficult for Japan to invade Yunnan by way of Indo-China or Kwangsi. However, Japan used her newly-acquired air bases in Tongking to bomb the Burma road, Kunming and other important centres in southwestern China. Toward the end of Oct. 1940, Japanese troops withdrew from Nanning and all military posts in Kwangsi due to: Chinese military pressure; Japan's strategy of shortening her defence lines in the coastal region; and Japan's attempt to gain military advantages in the southern Pacific. In November Japan concentrated large forces at Hai-phong, Kwangchow-wan and on the Hainan island and Formosa for the southward drive.

Cost of the War.—At a great cost of money and men Japan penetrated 15 Chinese provinces and occupied fully or partly 551 of China's hsien (counties) and 15 of China's 23 municipalities. Tenuously Japan controlled about 500,000 sq.mi. of China and 80% or 90% of China's prewar railways. She controlled practically all the important coast ports and the main waterways. She forced the closure of the Indo-China Yunnan railway and of Hongkong, seized the main part of the customs revenue and forced Great Britain to close the Burma road for three months. Chinese casualties were very high and no less than 2,000,000 soldiers and 3,000,000 civilians lost their lives. Millions of people were uprooted and more than 30,000,000 became refugees.

The Japanese army admitted they lost over 100,000 men; Chinese military headquarters placed the figure of casualties as high as 1,800,000 and neutral observers at 700,000 to 800,000. Japan mobilized and dispatched to the Chinese fronts over 1,000,000 men. About two-thirds of Japan's land forces, 75% of her army air force and a considerable part of her navy were tied up in the Chinese campaign. Moreover, Japan found herself in economic difficulties. She had spent about 16,000,000,000 yen on the war and her government financial budget increased from about 5,000,000,000 yen in 1937-38 to 10,500,000,000 yen in 1940-41. The supplementary war budget for the period of hostilities amounted to 12,000,000,000 yen. According to Finance Minister Kawado, Japan's note issue in 1940 went up from 3,810,000,000 yen to 4,540,000,000 yen. Her foreign trade fell off. It was estimated that Japan's national debt increased from about 10,500,000,000 yen in 1937 to 28,000,000,000 yen in 1940. The heavy burden of the war, the high cost of living, the various taxes and levies, the restrictions of output in the light industries, the policy of price-fixing, the dearth of agricultural products and the shortage of coal, fuel, sugar and rice were all seriously depressing the standard of living of the Japanese people. There were indications of discontent and growing anti-war sentiment among the Japanese people. It did not seem that Japan could attain her objectives by military force alone.

Economic and Financial War.—Japan's purpose was to crush China's economic resistance and, wherever possible, to exploit Chinese resources for the military campaign against China. The immediate objectives expressed in the resolutions adopted in Oct. 1939 by the Japanese Asia Rehabilitation administration were as

follows: to confiscate large Chinese industrial enterprises in the occupied areas and to incorporate small ones under the name of joint ownership; to control all raw materials and develop resources for the military supply of Japanese garrisons; to forbid the use of Chinese legal tender in central China; and to establish free exchange between the new currency of north China and central China. These resolutions were carried out and two companies (the North China Development company and the Central China Development company) were established by the Central Board of East Asiatic Affairs in Tokyo to push the trade and industrial activities and monopolies in the occupied territories.

In order to undermine Chinese national currency and to weaken the confidence of the Chinese in the national government, Japan created the Federal bank in Peking and the Hua Hsing bank in Shanghai and introduced military notes throughout the war-torn districts in China. The Japanese-sponsored currency was not, however, powerful enough to supersede the legal tender issued by the four banks of the national government. In Nov. 1940, Japan took control of the Central Bank of China in Shanghai and in December the Japanese-sponsored government at Nanking authorized the establishment of a Central Reserve bank which will float a huge new currency issue, similar to the Chungking government's notes. By such measures Japan expected to undermine the Chinese national dollar and to extend the authority of the Nanking government over currency throughout the occupied areas. Toward the end of 1940 Japan's note issue reached 4,540,000,000 yen and China's was estimated to be over 6,000,000,000 yuan. Since both the Japanese and Chinese prewar note circulations were on the same level, China's note issue exceeded the Japanese. Chinese currency is backed up by cash reserves and securities and according to the statement of the Chinese finance minister British and American loans have raised China's foreign exchange reserve fund by 50%. The Chinese dollar, which was worth almost 30 American cents before the Chinese-Japanese war, was quoted at less than six cents on Dec. 31, 1940, while the Japanese yen was artificially maintained at about 23½ cents. However, in free markets at Shanghai the Japanese yen has often fallen below the value of the Chinese dollar. The governments of the United States and Great Britain adhered to the view that the Chinese dollar is the sole legal tender currency in China.

China's economic defence measures were planned to establish new economic bases in the southwestern provinces, to improve international trade routes (*see CHINA*), to control foreign exchange and to blockade Japan economically. Three emergency measures were adopted to carry out the last measure. In Aug. 1939, the national government prohibited the smuggling of articles to the enemy which could be used to make munitions or as exports to foreign countries for foreign exchange. Secondly, goods manufactured in Japan, in Japanese colonies and in the occupied areas with Japanese capital were boycotted. Thirdly, the government extended guerrilla activities in order to obstruct, even destroy, as much as possible, Japan's schemes to develop the occupied territories. Together with the control of the leading export and import activities the national government adopted measures such as restricting the withdrawal of bank deposits, limiting the outflow of Chinese national currency, negotiating credit loans and barter agreements, government absorption of foreign exchange and centralized control of foreign exchange allocations for trade and other legitimate demands to protect its specie reserve and foreign exchange.

Japan's Political Offensive.—Simultaneously with the military offensives Japan used political weapons to destroy China's internal unity by creating a puppet central government and then by trying to subjugate China with the help of the Chinese themselves. After Japan formally notified the diplomatic representa-

tives of other powers at Tokyo in July 1938 that the Japanese government would withdraw its recognition of the national government of China, she began to look for a prominent Chinese to form a new central government. After the death of Wu Pei-fu in Dec. 1939, Wang Ching-wei, who was willing to accept Konoye's declaration of the three-point peace settlement of Dec. 1938, was chosen to head the new central government. In Dec. 1939, the draft agreement of the Sino-Japanese Treaty for Mutual Adjustment which made China virtually a Japanese protectorate was signed between Wang and Japan. In Jan. 1940, Wang asked General Chiang to end resistance and make peace. On March 30, the All China government which was an imitation of the Chungking government and actually confined to the occupied areas of Kiang-su, Chekiang and Anhwei was inaugurated at Nanking. Before the signing of the peace treaty Japan only acknowledged Wang's regime *de facto* and formal recognition was not granted until Nov. 30, 1940. The foreign minister at Chungking pronounced the new regime illegal, China threatened cessation of normal relations with any power recognizing the Wang regime, and the United States, Great Britain and soviet Russia declared Chungking to be the legitimate government of China.

Since the creation of the new regime at Nanking failed to secure the recognition of foreign powers and the support of the Chinese people, Japan could only bring about peace either by crushing Chinese resistance or by offering peace terms acceptable to the Chinese. The deterioration of the economic and financial situation, the unsatisfactory result of the exploitation in the occupied territories, the heavy cost of the revival of strong military action and the popular demand to bring hostilities to an end caused Japan to make, unofficially, fresh peace offers in July and Aug. 1940. In October, encouraged by Germany who wanted Japan to have a free hand for bigger adventures, Japan offered China more liberal terms. Having failed to approach Chungking, General Nobuyuki Abe, special envoy representing the emperor of Japan, signed the "peace treaty" with Wang. Japan recognized his regime as the "national government of the republic of China."

Europe and the Far East.—The conflict in Europe has had its effects in the far east. The conclusion of the anti-Comintern pact of Nov. 1936 and the Italian adhesion to the pact in Nov. 1937 weakened France and Britain in the far east and diminished Japanese fear of Russian intervention in the Sino-Japanese war. In Aug. 1939, when Germany concluded a nonaggression pact with

Russia, the Japanese anti-Comintern policy was shattered. Before the outbreak of the European war in 1939, irritation was caused in Tokyo by German aid to, and trade with, China. Japan stopped this trade and tried to prevent China from receiving any aid from the powers. Before the conclusion of the Berlin-Rome-Tokyo tripartite alliance Japan followed a policy of "non-involvement" while the British and French tried to appease Japan and looked to the United States to keep Japan in check. As the effective strength of Britain and France in the far east declined, Japan extended its control and influence.

On June 19, 1940, Britain, yielding to Japanese demands for the right to dispose of the Chinese government's silver deposits to circulate the so-called Federal Reserve bank notes and to have certain police power in the British and French concessions, signed an agreement with Japan to settle the two-year-old disputed issue at Tientsin. On June 20, the French ambassador at Tokyo signed a statement pledging respect for Japan's "military necessities" in China. The British ambassador used the same phrase in the Craigie-Arita formula of July 24, 1939. Immediately after this statement France allowed Japanese inspectors to be stationed at Hanoi, Hai-phong and other points in Indo-China to examine the stocks of materials which might go to China. In Shanghai, in the latter part of June, French concession authorities surrendered a part of the International Settlement and the French concession to Japan and permitted the Japanese army to extradite Chinese suspects and participate in military searches within the concession. In November they handed Chinese courts to the Wang regime. In order to put pressure on Britain to close the Burma road, Japanese troops occupied the mainland north of Hongkong on June 22. In early July the British government announced its decision to shut off the transport of supplies through Hongkong and to close the Burma road for a period of three months, beginning July 18. In early August Britain withdrew the remaining British military forces at Shanghai, Tientsin and Peiping.

With the approbation of Germany and Italy the new Konoye regime proclaimed Japan's "new order" to include a "greater east Asia" embracing Indo-China and the East Indies. Japan demanded from France the right to establish naval and military bases in Indo-China, to move troops through this area and to secure a new trade agreement favourable to Japanese interests. Despite the French acceptance of the demands on Sept. 22, the Japanese south army invaded Indo-China on the following day. Japan's drive to southern Indo-China and to the south seas led to ne

HUGE BILLOWS of smoke and dust rose over Chungking June 28, 1940, after a three-hour Japanese air raid

concrete action while hostilities and air raids between France and Thailand continued along the border of Indo-China. After the conclusion of the tripartite alliance, Japan tried to reach an agreement with Russia at China's expense. It has been soviet Russia's policy to protect its far eastern interests, to aid a resisting China and to avoid war with Japan. Since the Russian far eastern policy remained unchanged, negotiations for a general soviet-Japanese accord did not go beyond border disputes and the perennial fisheries question. Due to American and British warnings against a Japanese southward move it seemed doubtful in 1940 that Japan would undertake such a drive without a general understanding with Russia.

The United States and the Far East.—Japan's aggression in China constituted a threat to American interests in the far east. As Japan carried out her policy of aggression in China with vigour, the United States faced a choice between a compromise with Japan and firm resistance. Before Japan's invasion of Indo-China and the conclusion of the tripartite alliance, American action to stem the Japanese advance was limited to moral gestures, statements of policy, denunciations of Japanese bombings of civilians, disapproval of Japan's "new order," moral embargo and economic measures, such as the termination in Jan. 1940 of the treaty of commerce and navigation with Japan, the licence control since July of aircraft parts, metal-working machinery, aviation gasoline and iron and steel scrap of the Number 1 grade and small credit loans to China.

Since the United States had the power both to increase the strength of Chinese resistance and to cut off the supplies of oil, steel scrap and other war materials upon which Japan depended for the prosecution of the war, Japanese former foreign ministers Nomura and Arita in the Abe and Yonai cabinets made gestures to improve Japanese-American relations, but the situation became worse when Japan embarked on a policy of southward expansion and became a member of the axis.

Japan's drive to the south not only endangered the source of much of American rubber and tin but it also menaced the security of the Philippines. On April 17, 1940, Secretary Hull expressed American concern regarding maintenance of the *status quo* in the area of the Pacific and repeated the same statement on May 11 and Sept. 4. When the French-Japanese agreement of Sept. 22, which gave Japan a foothold in Indo-China, was disclosed, Secretary Hull stated that "the *status quo* is being upset and that this is being achieved under duress." On Sept. 27, Washington announced the embargo on all scrap metal to be effective on Oct. 16 and, in December, the export control extended to include steel and iron. On the same day the long overdue Berlin-Rome-Tokyo alliance was signed and the axis powers and Japan recognized and supported each other's leadership in the establishment of a "new order" in Europe and Asia. The purpose of this pact was to isolate Britain and to warn the United States but the result was just the opposite. Anglo-American co-operation in the far east was reinforced by further consideration of possible use by the United States of British naval and air bases in that area. Despite threatened reprisals Britain reopened the Burma road and extended a new loan to China. The United States took a firmer attitude toward Japan by extending new and larger loans to China, by sending naval and air reinforcements to Hawaii and the Philippines, by pronouncing the policy of aiding nations resisting aggressors and by advising American citizens to evacuate the far east. This last measure created a sobering effect on Japan and Admiral Nomura was selected as Japanese ambassador to the United States to follow a new policy of temporary appeasement. Chinese Turkestan: see SIN KIANG.

Chosen (Korea), a part of the Japanese empire, is a peninsula extending southward from the northeastern part of the continent of Asia. Its eastern coast faces the Sea of Japan, its western coast the Yellow sea; and it borders Manchoukuo and the maritime province of Siberia on the north. Area 85,206 sq.mi., including 1,018 islands. Population (Dec. 31, 1937) 22,355,485, including 629,512 Japanese and 43,118 other foreigners, mostly Chinese. The capital is Seoul (Keijo), population (1937) 706,396. Other cities: Fusan, 213,142 (1937); Ph्यों-yang (Heijo), 185,419; Taikyū, 110,866. Governor general, General Jiro Minami (since 1936). The country is administered by the government-general, which is divided into a secretariat and the bureaus of internal affairs, finance, justice, industry, education, politics, communications, railways and monopolies. A central council, consisting of a president, vice-president, five advisers and 65 councillors, acts in an advisory capacity to the governor.

Education and Religion.—Chosen in 1937 had 4,740 schools of all kinds and 1,211,449 pupils. There are a number of foreign Christian mission schools in the country. There were 6,397 Korean students studying in Japan on Oct. 1, 1936. Prevalent forms of religion among the Koreans are Confucianism, Buddhism and Taoism. There were 489,626 Christians in Chosen in 1936.

Finances and Banking.—The unit of currency is the Japanese yen (worth 23.48 American cents in Dec. 1940). The Bank of Chosen is the central banking institution and there are nine other banks, including the Chosen Industrial bank and the Chosen Savings bank. Deposits in the Bank of Chosen in 1937 were 293,944,000 yen and deposits in seven ordinary banks (excluding the Chosen Industrial bank and the Chosen Savings bank) were 172,749,000 yen. The budget for 1939-40 was 643,217,000 yen.

Trade and Communications.—Chosen's foreign trade is mainly with Japan. Exports to Japan in 1938 were 710,540,000 yen and imports from Japan were 921,346,000 yen. (These figures include trade with all parts of the Japanese empire). Exports to foreign countries in the same year were 169,067,000 yen and imports were 134,583,000 yen.

There were 5,397.8 km. of railways and 27,731 km. of highways in Chosen in 1938. There were 1,134 steamers with a tonnage of 70,184 and 11,730 sailing boats with a tonnage of 150,473. There are three airports at Seoul, Ph्यों-yang and Urusan and there is a meteorological station at Urusan. The total length of telegraph and telephone lines is 8,863 km. and 11,115 km. respectively.

Agriculture, Manufactures, Minerals.—Chosen is predominantly an agricultural country, with rice as the most important crop, but manufacturing industry and mining have been making rapid progress. The value of agricultural production grew from 681,399,000 yen in 1929 to 1,303,016,000 yen in 1937. During the same period the value of industrial production increased from 327,007,000 yen to 959,308,000 yen and that of mining from 26,488,000 yen to about 150,000,000 yen. There have been considerable fluctuations in the rice crop, a bumper yield of about 120,000,000bu. in 1938 being followed by a crop of a little over 70,000,000bu. in 1939 as a result of drought. Other agricultural products include wheat, barley, soybeans, apples, cotton, sugar beets and silk. Gold is the most important mineral product, its value in 1936 (the last year when statistics were published) being 49,909,000 yen (then worth about \$14,000,000). (W. H. CH.)

Christian X (1870—), King of Denmark, K.G., of whom a biographical account will be found in the *Encyclopædia Britannica*, vol. 5, p. 630, nephew of Queen Alexandra of Great Britain, succeeded his father, Frederick VIII, in 1912. He has been known for his horseback rides through Copenhagen and has been generally beloved by all classes of his people. The Germans made no move in 1940 to displace him. His 70th birthday (Sept. 26, 1940) was the occasion for popular demonstrations throughout the kingdom, and especially before Amalienborg palace, expressive of a deep national solidarity as well as personal love of the monarch. (F. D. S.)

Christian Science. Mary Baker Eddy issued her first and principal book on Christian Science, *Science and Health with Key to the Scriptures*, in 1875. She founded the Church of Christ, Scientist, at Boston in 1879, as a church "which should reinstate primitive Christianity and its lost element of healing" (*Church Manual*, p. 17). By 1940 this denomination had spread to all countries where English is spoken and to other countries on all continents of the world. Authorized Christian Science literature was published to different extents in 17 languages. It included periodicals in the English, French, German, Dutch and Scandinavian languages.

Christian Science, as an individual interest and as an organized religion, has progressed steadily from its beginning. This progress continued in 1940 but was somewhat hindered then by the conditions incident to war. Wartime conditions also furnished opportunities for wartime helpfulness. These opportunities the Christian Scientists have accepted in increasing measure, as permitted by the many pertinent laws and regulations. For instance, the Christian Science Mother Church (The First Church of Christ, Scientist, in Boston, Mass.) supplied "officiating chaplains" for British army camps and this Church's War Relief Committee collected and forwarded large quantities of clothing to British sufferers from the war.

The *Christian Science Monitor* (international daily newspaper) has its own European news service besides that which it gets through membership in the Associated Press. The Christian Science denomination (Dec. 1, 1940) included 2,858 churches and societies, besides many Christian Scientists living where local congregations are not yet organized. There were 2,177 churches and societies in the United States, 319 in Great Britain, 88 in Germany and 274 in other countries, including those most distant from Boston (Australia, New Zealand and South Africa). There were 72 Christian Science Organizations at colleges or universities, of which 69 were in the United States. Over 11,000 practitioners were engaged in Christian Science healing in 1940. (C. P. S.)

Christian Unity. Marked progress took place in 1940 in the closer combination and strengthening of agencies in which the churches were already united. The assembly of the English Free Church council, meeting in April, completed the merger of two existing organizations, the Federal council and the Free Church council, thus creating a single common organ for the group. In the United States the Home Missions council and the Council of Women for Home Missions united in December. A Joint Field department has been maintained by six of the major national co-operative agencies, and representatives of these agencies have carried on formal conversations looking toward their unification, which were in 1940 expected to pass into the stage of active negotiations. The Protestant Episcopal Church, previously affiliated in only limited areas of activity, accepted full membership in the Federal Council of the Churches of Christ in America.

The confused state of the world complicated movements for

church unity at numerous points. Thus, Japanese churches had long been looking toward unity on established lines, but had it arbitrarily forced upon them as a result of the drastic Religions bill requiring "all religions to fit into the framework of Japan's new national structure." Under this pressure the churches of Baptist, Congregational, Lutheran, Methodist, Presbyterian and United Brethren origins united on Oct. 17. The Anglican Japanese Church attempted to maintain independent existence and the government apparently accorded separate status to the Roman Catholic and Eastern Orthodox churches within the now legally recognized Christian group. Heightened racial tension in South Africa caused churches of African natives to withdraw from inclusive negotiations for unity in favour of a movement for an all-African church.

Discussion of unity was also accelerated by political circumstances. The unification of the German Free churches was actively discussed.

The piecemeal unification of denominations went forward, especially in the United States. The union of the United Brethren and Evangelical denominations was being submitted in final form to the minor jurisdictions of these churches. In discussions of the doctrinal basis for union among the three major Lutheran groups, agreement in principle seemed to have been reached, but without a common understanding as to the kind of union which should follow.

In connection with current negotiations between the Protestant Episcopal and the Presbyterian Church, U.S.A., a proposed concordat intended to provide "means whereby each church may, whenever it seems locally desirable, assume pastoral charge of members of the other church and offer them the privileges of the Holy Communion, thus establishing one congregation," was not pressed for action because of strong opposition in the convention of the Protestant Episcopal Church; but further negotiations were authorized.

Additional churches in Australia, Canada, England, Scotland, Switzerland and seven in the United States joined the World Council of Churches. The most notable of its new adherents was the Church of England. The activities of the World Council have gone forward continuously, its agents moving somewhat freely among the churches of all the belligerent and many of the occupied countries in ministries of encouragement and mutual aid, and in work for war prisoners and refugees. (H. P. D.)

Christopher, PRINCE (1888–1940), uncle of King George II of Greece, was born at the chateau of Pavlovsk near Leningrad (St. Petersburg) July 29, the son of King George I of Greece and the former Grand Duchess Olga of Russia. He received a military training and served in the Balkan wars. As a possible heir to the throne he was initiated into the duties of a ruler. On Feb. 1, 1920, he married Mrs. William Leeds, the widow of an American tin-plate manufacturer. She died Aug. 29, 1923. On Feb. 10, 1929, he married the daughter of the Duc de Guise, Orleans pretender to the French throne. He died in Athens, Jan. 21.

Chromite. World production of chromite declined materially in 1938 and 1939 from the high figure of 1937, and it remained to be seen to what extent European war demand in England and the United States is able to offset the decline caused by the loss of practically the entire continental market in Europe. No import figures were available in 1940 outside of the U.S., where, judging from the first 10 months' returns, the total for the year would probably exceed the record figure of 1937. Among the important producers, Turkey during the first quarter of 1940 remained at about the average for 1939; South Africa during

the first half showed a small increase over the 1939 average for production, but a decline of 45% in exports, part of which was due to loss of continental markets, and part to lack of shipping facilities; the greatest improvement was in Southern Rhodesia, where output during the first half almost equalled that for the whole of 1939, but no information was available on exports; the Philippines increased by more than one-third during the first half, as compared with the 1939 average, while Yugoslavia declined about one-fourth in the first quarter.

The Turkish government made a loan of £T.1,000,000 to the Eti bank, which will be used to assist chromite producers, by making loans on ore stored at export ports.

The United States produces only a few hundred tons of chromite, but in 1937 imported 562,800 tons; in 1938 and 1939 imports dropped but recovered to 520,000 tons for the first 10 months of 1940.

(G. A. Ro.)

Chromium: see METALLURGY.

Chronology: see CALENDAR OF EVENTS, 1940, PAGES 1-16.

Chrysler, Walter Percy (1875-1940), U.S. industrialist, was born in Wamego, Kan., April 2 and was educated in the high school at Ellis, in the same state. He began work as a machinist's apprentice in the railroad shops in Ellis. At the age of 33 he had risen to the post of superintendent of motive power and machinery of the Chicago and Great Western railroad. Two years later he was made assistant manager of the Pittsburgh works of the American Locomotive company; he was made manager the next year. Sensing the future of the motor car, he abandoned railroading to accept a position with the Buick Motor company in 1912, becoming its president and general manager in 1916. In 1919 he was made vice-president in charge of operations of the General Motors corporation, leaving this corporation in 1920 to manage the Willys-Overland company and the Maxwell Motor corporation. While he was engaged with the Maxwell corporation he developed a car of his own and put it on the market. This venture was followed by the organization of the Chrysler corporation, into which were absorbed the Maxwell and Chalmers corporations, and later the Dodge company. Mr. Chrysler served as president until 1935. In the meantime he had built the Chrysler building in New York city, which was the tallest structure in the city at the time. He died at Great Neck, L.I., N.Y., Aug. 18.

Churchill, Winston Leonard Spencer (1874-), British statesman, was born on Nov. 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during the war of 1914-18, see *Encyclopædia Britannica*, vol. 5, pp. 686-7.

Particularly after the union of Austria and Germany in March 1938 did Churchill become an outspoken opponent in parliament of Prime Minister Chamberlain's conciliatory dealings with Germany and Italy. But when the government took a firmer stand with the axis, Churchill pledged Chamberlain his political support. The outbreak of war on Sept. 3, 1939, was the occasion for his re-entry into the cabinet in his old office of first lord of the admiralty. On May 7, 1940, Chamberlain, partly in answer to criticisms of the Norwegian campaign, made him supervisor of day-by-day military operations. Three days later, as the big German drive began and Chamberlain resigned, Churchill became prime minister. The military disasters which followed in rapid succession served to emphasize his qualities of leadership, which had a strong effect in bolstering British morale at one of the gravest moments in the empire's history. On June 4, after the successful evacuation of Dunkirk, he promised that Britain would fight on alone, "whatever the cost may be."

Churchill's public addresses and reports to parliament as the war progressed were in the main simple and frank statements that did not attempt to disguise the gravity of Britain's danger but invariably pointed up the nation's will to resist. Among his more notable pronouncements of 1940 were the following: June 16, he proposed a Franco-British federation which was rejected by the new Pétain government; July 18, he announced the agreement with Japan to close the Burma road (reopened three months later); Oct. 21, in a radio message to the French people, he urged them not to sabotage British war efforts which in the end would bring about France's liberation; Nov. 5, he warned against the growing peril of German submarines to British supply lines and urged the necessity for naval bases in Eire; Nov. 13, he announced Britain's great air raid against the Italian fleet at Taranto; Dec. 12, he reported on the success of the drive against the Italian forces in Egypt, a victory "of the first order"; Dec. 23, he appealed to the Italian people to oust Mussolini.

On Oct. 9 he was elected leader of the Conservative party to succeed Chamberlain (*q.v.*). (See also GREAT BRITAIN.)

Church Membership. Church membership showed an increase of 528,631 for 1940, in inclusive membership, as compared with statistics of 1939. The number of churches was 248,780.

This report is based upon the latest figures available, as reported by Dr. Henry Barraclough, secretary of the Association of Statisticians of American Religious Bodies. They cover the period between Jan. and Oct. 1939, and they include churches of over 50,000 members. Further information will be found in the *Year Book of the Churches*, published in 1941 by the Federal Council of Churches of Christ in America.

The "inclusive membership" column in this report gives the official records of the church bodies listed, based on their own reports. The "13 years or over" column is given for use in comparisons and discussions of the relative numerical standing of the churches reported.

The Methodist Church, which became the name of the merged Methodist Episcopal, Methodist Episcopal South, and Methodist Protestant bodies, had no new census report based on the merged body. Hence, they are given here under their former names. The largest Protestant group since their union, they listed 7,544,057 members. (See also CHRISTIAN UNITY.)

*Continental United States only.

Church of England. During 1940 the church's special efforts to meet the needs of the times were impressive. The archbishops, bishops and clergy were tireless in leadership, and the work of church organizations of all kinds in connection with the migrations of women and children from the danger areas was excellent. The response of the younger clergy at the outbreak of the war to the need for chaplains to the military forces had its sequel in the heroic work of the chaplains in the evacuation of the British expeditionary force from France, when some deliberately chose to become prisoners of war rather than leave the wounded and when a number received awards for gallantry. Such deeds, however, should not be allowed to obscure the courage of thousands of incumbents who remained at their posts, some of them doing so in parishes where whole streets had been reduced to ruin.

The cathedrals and collegiate churches continued their services. A time bomb just missed St. Paul's cathedral and the danger may be estimated from the fact that when removed and exploded on Sept. 15 it caused a crater 100 ft. in diameter. Later, a bomb damaged the high altar. Canterbury, Southwark and Rochester cathedrals were among others which had narrow escapes; and several hundred churches in London and elsewhere were demolished or severely damaged. Building was continued on the new cathedrals of Liverpool, Guildford and Blackburn and on the extension of Portsmouth cathedral.

On June 10 the king opened the new church house, Westminster, probably the most important architectural building completed in 1940, the business headquarters of the Church of England and a centre also for the whole of the Anglican communion. Tributes were paid on that occasion to the initiative and ability of Dr. Frank Partridge, bishop of Portsmouth, the "moving spirit" of the enterprise, and to the genius of the architect, Sir Herbert Baker. During the year the church assembly

passed the benefice buildings (postponement of inspections and repayment of loans) measure and the ecclesiastical dilapidations (chancel repairs) measure.

Outstanding changes in personnel included the resignations of Dr. W. G. Whittingham as bishop of St. Edmundsbury and Ipswich, of Dr. M. Linton Smith as bishop of Rochester, and of Dr. C. C. B. Bardsley as bishop of Leicester, and the appointments to these bishoprics respectively of the Ven. R. Brook, archdeacon of Coventry; of the Rev. C. M. Chavasse, master of St. Peter's hall, Oxford; and of the Rt. Rev. G. Vernon Smith, bishop of Willesden.

In the wider world of the Anglican communion special mention must be made of the decision of the Nippon Seikokwai (Japan Holy Catholic Church) to assume complete independence of western aid; of the continuing difficulties of the dioceses in China due to the war; of the very special difficulties of the diocese of Gibraltar and the Anglican chaplaincies in the jurisdiction of northern and central Europe; of the affiliation of the Church of England to the World Council of Churches (in process of formation), which is to carry on officially the work of the oecumenical movement on behalf of the churches; of the serious decline in the incomes of important British missionary societies; and of the generous declaration by Dr. H. St. G. Tucker, presiding bishop of the Protestant Episcopal Church in the United States of America, made on July 11, inviting the American church to contribute to the support of those world-wide missionary activities which looked to the Church of England for financial assistance in the years before the war. (Ro. Sto.)

Church Reunion: see CHRISTIAN UNITY; RELIGION.

Ciano, Galeazzo (1903—), Italian statesman, born March 18 at Leghorn, was the son of Costanzo Ciano, naval hero of the World War of 1914-18. After completing his studies in law at the University of Rome, Galeazzo Ciano entered the diplomatic service and was stationed successively at Rio de Janeiro, Buenos Aires and Shanghai. After his marriage in 1930 to Edda, daughter of Benito Mussolini, his advancement was rapid. In 1934 he was appointed undersecretary of state for propaganda and in the following year minister of the department. In June 1936 he was named foreign minister by Il Duce. The year 1940 held a series of important diplomatic conferences for Ciano and his German counterpart, Ribbentrop (*q.v.*). In June he headed the Italian delegation which signed the Italo-French armistice of June 24.

During the remainder of the year he was present at conferences with Hitler, Goering, Ribbentrop and Laval. On Nov. 20 he signed for Italy the Vienna pact by which Hungary adhered to the axis.

Civil Liberties. The increasing violence of the struggle in Europe, plus the spectacles of disintegration from within, à la Quisling, during 1940 gave rise to increasing antagonisms and pressures for suppression in the U.S. In particular, fears of fifth-column activity, stemming from the stealth and anonymity of communist and nazi forces, gave rise to an indis-

criminate suspicion of all persons and groups who, because of their origins or their ideas, differed from the norm. The most vocal expression of these fears was to be found in the publicity of the Dies committee, which tarred bona fide consumers' groups, liberals and progressives with the same brush as paid agents of foreign governments. The committee is responsible, however, for the passage of a bill calling for fuller disclosure as to foreign agents.

Because of the experience abroad, aliens came to be associated in the public mind with subversive activity, and a federal statute requiring all aliens to register and be fingerprinted was enacted. Fortunately, local state efforts at repression and regulation of aliens proved abortive, but many states denied to the communist party a place on the ballot. This denial of election rights was in 1940 the greatest setback to civil liberties and could have been avoided had the communists not used such tactics as bespoke an active desire to be driven underground.

The LaFollette civil liberties committee continued its courageous disclosures of suppressive groups, particularly among employers, but in 1940 no legislation stemmed from its efforts.

In the field of freedom of conscience the United States supreme court held it to be a proper school legislation to require all those attending public schools to pledge allegiance to the American flag. The cause of racial equality in the school system was given fresh impetus when the test case brought by the National Association for the Advancement of Colored People resulted in a decision that the state of Maryland could not validly pay lower salaries to Negro teachers than to whites in similar positions. Prejudice of a different kind triumphed in New York city when Bertrand Russell was prevented from taking his professorship at the City college on the ground that the ideas he held on such subjects as sex rendered him unfit to teach mathematics and logic.

A victory in the struggle against prudery was won when the federal court of appeals for the District of Columbia held proper for importation a dignified treatise on nudism containing pictures of nude males and females, both singly and together. Partially on the debit side was the decision of the highest court in Connecticut upholding the Connecticut birth control statute which prohibits the use of contraceptives and which was invoked against two doctors and a nurse (who had prescribed contraceptives) on the ground that they were accessories to the crime of using them. The court expressly left open, however, the question whether such prescription might not be legal in cases involving actual "jeopardy of life" from pregnancy. The Massachusetts supreme court whittled away some of its former antinatal control decision when it held that druggists could legally sell prophylactics unless the prosecution could show that the prophylactics were not to be used for the prevention of disease, a virtually impossible assignment.

Books and magazines bearing the imprint of reputable publishers were singularly free from attack during 1940. The continued lack of courage on the part of movie producers, however, meant that various state censorship boards continued to snipe at productions, forcing cuts in some cases and complete withdrawal in others.

In the case of the radio, the code of the National Association of Broadcasters which prohibits the sale of time for the discussion of controversial issues unfortunately meant as a practical matter that less time was devoted to such discussion and, in particular, scant attention was paid to subjects of local interest no matter how vital to the communities served. Nevertheless, the radio, under the administration of the federal communications commission, continued to grow in strength in comparison to the newspapers, which were declining in number. It may be that freedom of the air will overshadow in national importance freedom of the press.

It was feared that the Selective Service act might provoke a host of civil liberties problems. However, the act itself makes provision for conscientious objectors and its wise and tolerant administration has been such that relatively few cases have arisen and those for the most part because the men involved refused not only to serve but also to register.

(M. L. E.)

Civil Population, Protection of: *see* CHEMICAL WARFARE.

Civil Service. During the calendar year 1940 the merit system continued to make steady progress, thus closing the decade on a more hopeful note for an improved public service than might have been thought possible in its mid-term. The most significant event was the passage of the Ramspeck bill in the closing days of the 76th congress. This enactment authorized the president to cover into the classified civil service practically all federal positions now exempt, with the exception of positions in the Tennessee Valley authority, the Work Projects administration and positions subject to confirmation by the senate.

The act also authorized the president to extend the provisions of the Classification act of 1923 to the federal service generally (the field service has never been affected), to set up new classifications and scales of pay and to introduce pay differentials for offices at isolated, remote or inaccessible stations or which involve excessive physical hardships or hazards. Finally the Ramspeck act required the establishment in each department of one or more boards of review to hear appeals on efficiency ratings; the chairman of the board is designated by the civil service commission, one member is selected by the head of the department and one elected by the employees. The board and its employee representative both constitute significant innovations. On its broad scope and authorizations, this act deserves to stand as one of the landmarks of civil service reform.

During 1940 state merit councils were organized in all states which lacked civil service commissions for the purpose of holding the examinations required by the 1939 amendments to the Social Security act, and by the end of the year most of the state offices co-operating with the Social Security board had passed under the merit system. The basic requirements of the state systems were specified by the board.

In the Nov. 1940 elections three constitutional amendments requiring or permitting state-wide civil service systems were approved in Michigan, Louisiana and Kansas respectively. The Michigan amendment repaired the damage to the merit system wrought in 1939 by a political overturn, although the form of the amendment was widely criticized; the Louisiana proposal confirmed a new merit system established a few months earlier by legislation and which will be fully effective in 1942; and the Kansas amendment was permissive in nature, although having the important effect of terminating a four-year limit on officeholding. Meanwhile a breakdown in Rhode Island was feared as a result of the 1940 elections in which Governor Vanderbilt, who was chiefly responsible for the inauguration of the merit system in that state, was defeated.

Another important phase of the civil service movement was the enactment by congress in 1940 of the second Hatch act, extending prohibitions against pernicious political activity to all state and local employees paid in part from federal funds, protecting both such employees and relief clients or workers from political assessments and limiting the total expenditures of national party committees.

The provisions of this enactment are sufficiently important both in themselves and in their federal-state context to warrant brief enumeration. The act prohibits any officer or employee of any state or local agency financed in part with federal funds from using their official authority to influence an election or nomination and from requesting any other such officer or employee to make political contributions. They are prohibited from taking any active part in political management or in political campaigns. Certain forms of pernicious political activity are defined and prohibited. The U.S. civil service commission is given power of enforcement, with provision for appeal to the courts.

Despite some loopholes in this measure it revealed the impatience of congress with local political machines fed in considerable part by federal funds and, it must be added, sometimes in the hands of local politicians hostile to incumbent congressmen. The effect upon political participation of public employees in the 1940 election was both noticeable and beneficial. New York state enacted a similar but somewhat weaker measure dealing with state employees.

The civil service assembly issued a revised edition of its census of civil service jurisdictions which revealed the magnitude of the growth of the merit system since 1937. The number of city merit systems increased from 674 to 869; four new state-wide systems were recorded and one was abolished, but all states had introduced merit systems for social security employees. Little progress was recorded in the counties, but the number and proportion of federal civil service employees had increased.

National Defence.—The impact of the defence program was felt in full weight by the U.S. civil service commission. The employment of workers on the defence program was entrusted to the commission by congress. As a result the staff of the commission was more than doubled by the end of 1940 and its appropriations were increased from about \$3,000,000 a year to about \$8,000,000. The record of accomplishment in timely recruiting of needed employees in arsenals, navy yards, training camps and elsewhere was exceptionally satisfactory. A shortage of personnel technicians and administrators was apparent by the close of the year. The nation's resources in this field were being canvassed in the National Roster of Scientific and Technical Personnel, jointly conducted by the National Resources Planning board and the U.S. civil service commission.

New York.—During 1940 further steps were taken in New York to work out the practical aspects of placing about 150,000 local government employees under the provisions of the merit system. In 1937 the court of appeals held that the constitution of New York required positions in local government to be filled by the merit system. The problem was considered in 1938 by the constitutional convention, which declined to alter the constitutional provisions. In 1939 the legislature established a commission to recommend the necessary steps to cure the defect of a half-century's appointments without examination. An interim report was submitted in 1940 laying down in principle that present employees would not be required to take examinations in order to retain their positions and suggesting alternative methods of future administration. See *Legislative Document 92, 1940.*

Personnel Administration.—Omitting more than passing reference to the consolidation of the council of personnel administration into the U.S. civil service commission (without change of function) and the slow but still perceptible development of joint examinations between different jurisdictions, there may be noted in conclusion the steady development of professional interest and organization in the field of personnel administration. The Washington (D.C.) Society for Personnel Administration strengthened its numbers and position. The civil service assembly began publication of a quarterly, the *Public Personnel Review*, and initiated a study of standards in professional and technical fields in co-operation with the professional group appropriate in each case. The New York city civil service commission started publication of *Public Personnel Quarterly*. Supporting this general trend, the American Society for Public Administration was organized at the close of 1939 and in 1940 issued the first number of *Public Administration Review*, a quarterly in which the broader aspects of personnel administration receive attention. (L. D. W.)

Clairvoyance: see PSYCHICAL RESEARCH.

Clarke, Marguerite (1887-1940), U.S. actress, was born in Avondale, Ohio, Feb. 22, and was educated in the Brown County convent. While studying for the stage she took part in amateur performances with success and made her first professional appearance with a stock company in Baltimore in 1899. Her first appearance in New York city was as a child actress with DeWolf Hopper in *Happyland*. She co-starred with him two years later in *Mr. Pickwick* and *Wang*. She appeared in most of the successful musical shows for several years as well as in *Anatol* with John Barrymore and in *Jim the Penman* and *The Prince and the Pauper*. In 1915 she made her first appearance in motion pictures and within two years was one of the most popular screen actresses. In 1918 she married Harry Palmerston Williams of New Orleans; she then retired from the stage and lived on her husband's plantation in Louisiana. On his death in 1936 she took up her residence in New York city, where she died Sept. 25 after a short illness.

Clay. Clay production in the United States totalled 3,928,000 short tons in 1939, an increase of 14% over 1938, but 12% less than in 1937. Imports were 151,400 tons, against exports of 136,500 tons. Refractories of various kinds usually take 45-60% of the supply, ceramics 12-20%, paper 10-13%, filtering and bleaching oils and fats 7-8%, rotary-drilling mud 4-5%, and rubber and linoleum 2-3%. The production of clays of all kinds in Canada is so small as to be negligible, but there

is a well-established clay products industry which consumes something like 200,000 tons of imported clays. The clay industry of the United Kingdom is quite extensive, the output of low grade clays and shales amounting to 24,538,000 long tons in 1938; the higher grades included 2,598,000 tons of fireclay, 855,000 tons of china clay and ball clay; all were lower than in 1937.

(G. A. Ro.)

Cleveland, a city of northeast Ohio, occupies 73.74 sq. mi. with a population (1940) of 878,336. Cuyahoga county, which includes Cleveland and its major suburbs, has a population (1940) of 1,217,250.

History.—After Mayor Harold H. Burton was elected to the United States senate in the November election he designated Assistant City Law Director Edward Blythin to succeed him. This was accomplished by Burton appointing Blythin law director and then resigning at the end of December.

Under the city charter Blythin then automatically succeeded Burton as mayor.

The passage at a special election March 27 of an amendment to the city charter permitting city council to levy real estate taxes outside the constitutional 10-mill limitation and the passage of 2.1-mill relief levy at the Nov. 5 election contributed toward prevention of relief crises such as the city knew in 1939. In the last quarter of 1940 new acceptances of relief cases were at the lowest point in the history of Cleveland relief. The federal food stamp plan of distributing regular and surplus commodities was put into operation Nov. 1.

Education.—Budget problems continued to plague the Cleveland board of education throughout the year. After voters had defeated a one-mill special levy on May 14, the board on June 23 wiped out an impending operating deficit by cutting the salaries of all employees on a regular schedule. This it did by first raising all employees to 100% of schedule and making all automatic wage increases and then imposing a 30% cut from Sept. 1 to Dec. 31. But when the board sought renewal at the Nov. 5 election of a four-mill, five-year operating levy which provided about one-third of its income, the voters rejected it. The board then reduced the time limit to two years and resubmitted the levy at a special election Dec. 20 at which time it was approved by a majority of nearly two to one.

The Cleveland Health museum, first permanent exhibit of its kind in the United States, was opened Nov. 14 under the direction of Dr. Bruno Gebhard, former director of the health museum at Dresden, Germany.

Finance and Commerce.—Spurred by defence contracts and improved business generally, Cleveland factories expanded, hired more men and added new shifts in 1940. Direct defence contracts awarded to the city's industries during the year amounted to \$100,000,000. Still further construction was in sight, for first bids were received Dec. 23 on the \$8,400,000 aircraft engine research laboratory which is to be erected on a 200-ac. plot at Cleveland airport. About 300 persons will be employed at the laboratory when it is completed. Other large construction projects under way in 1940 included: \$8,200,000 generating station for the Cleveland Electric Illuminating company; \$5,500,000 Cuyahoga river straightening project which will open the upper river to the largest lake freighters; \$4,600,000 extension of Outhwaite homes, a public housing development; and a \$1,000,000 plant for the East Ohio Gas company to liquefy and store natural gas. Up to Dec. 1, 1940, collections in Cleveland's internal revenue district amounted to \$34,696,400 as compared with \$29,721,400 for the full year in 1939.

(P. By.)

Climate: see METEOROLOGY.

Clothing Industry. The clothing industry in 1940 continued recovering from the debacle of 1938. Particularly toward the latter part of the year a vigorous production upswing was noted which would unquestionably carry over to 1941. This was to a great extent due to government military contracts, wherein specifications ensured better garments for soldiers than those made in 1914-18. In civilian clothing the most noteworthy occurrence was the continued rise of sportswear in consumer favour, indicating a desire to stick to comfort and ease in clothing.

New machines appearing on the market included a new belt loop cutting machine, a saddle-stitch machine, a simulated hand-stitch machine, several new fast sewing machines, a very high speed buttonhole machine and special cloth laying equipment, all being timesavers and increasing production.

In the textile field the most outstanding events were the increased use of rayon and cotton—due primarily to the rise of sportswear. Woollens rose in price, due to vast government purchases, and it was debatable as to whether or not a shortage would appear.

The Wool Labeling act, requiring manufacturers to specify fibre content, became a law and there was much discussion as to its merits and the burden it placed on the manufacturers.

The European war did not greatly affect the industry except as pointed out above. Exports rose to a slight extent—almost entirely to countries in the western hemisphere. Interesting is the fact that several large clothing factories were being built in South America—formerly the stronghold of the custom tailor.

There was some wages and hours skirmishing, but generally the industry accepted the wage raises without bickering; some violations were reported and prosecuted by the government. Government activities in size standardization slowed down, due to financial retrenchment.

Up to and including Nov. 30, 1940, with about 56% (based on value) of the clothing industry reporting, total garments cut (including suits of wool, cotton, linen, mohair, trousers and knickers, overcoats, topcoats and separate coats, but not including dress pants, work clothes, shirts, leather garments, pajamas, and very heavy coats) in the men's, young men's and boys' industries totalled 25,208,000 compared with the 1939 figure of 26,064,000. Approximate cuttings in 1940 for all other divisions of clothing were (figures represent 71% of total production based on value), overalls and industrials, 4,850,000 dozen; cotton work pants, slacks, breeches, lined and leather coats, windbreakers, mackinaws, ski suits, hunting coats and miscellaneous sportswear, 7,550,000 dozen; shirts, pajamas and miscellaneous cotton garments, 15,960,000 dozen. Retail sales up to Nov. 30, 1940 were approximately 6% more than 1939, indicating increasing activity for 1941.

British manufacturers in 1940 suffered from government regulation and enemy bombing. They concentrated on uniforms.

(H. SN.)

Cloves: see SPICES.

Coal Industry. Of a world total coal production estimated at 1,466,000,000 metric tons in 1938, 75% was concentrated in four countries: Germany 26%, United States 24%, United Kingdom 16% and U.S.S.R. 9%. The comparative status of these major countries is shown in the accompanying graph. The second rank producers, 11 in number, controlled a total of 19%; France and Japan each had 3%, while Manchoukuo, which is under Japanese control, adds 1% to the latter; Poland, Czechoslovakia, Belgium and India, ranging from 2.4% to 1.7%, averaged 2% each, although Czechoslovakia and Po-

land have disappeared as independent producers and their outputs will be included in that of Germany. South Africa, Netherlands, Canada and Australia each had approximately 1%.

This leaves 4% to be distributed among no less than 34 minor producers.

British empire production is largely in Britain itself; the empire total being 22%, with 16% in Great Britain, nearly 2% in India, about 1% each in South Africa, Canada and Australia, there is only 0.6% remaining for other British territory; half of this is supplied by New Zealand, one-quarter by Southern Rhodesia and the remainder by Malaya, Nigeria, Eire and British Borneo.

United States.—Bituminous production in 1940 was estimated at 453,337,000 short tons, an increase of 15% over 393,065,000 tons in 1939. Anthracite production declined 3%, from 51,487,000 tons in 1939 to an estimated 50,059,000 tons. This gives a grand total of 503,396,000 tons in 1940, an increase of 13.2% over 1939. Industrial consumption of bituminous coal dropped from 33,183,000 tons in Jan. 1940 to 24,988,000 tons in June, with improvement to 37,652,000 tons in November. There were small rises in July and August, increasing in September and October, and declining again in November. The total increase from June to November was divided in the successive months as follows: July 7%, August 10%, September 41%, October 30% and November 13%.

Considering coal as a whole, Pennsylvania is the foremost producing state, but eliminating anthracite and comparing only on a bituminous basis, West Virginia comes first. These two states alone contribute well over half of the bituminous coal output of the United States. Distributed by fields, about 70% of the bituminous output comes from the Appalachian region (Pennsylvania, Ohio, West Virginia, Virginia, eastern Kentucky and Tennessee), 20% from the central region (Indiana, Illinois, Iowa, Missouri and Kansas), 6% from the Rocky mountain and western states and 3% from the southern field (Alabama).

COAL PRODUCTION OF THE WORLD and the major producing countries, as compiled by *The Mineral Industry*

CARLOADS OF GERMAN COAL entering Italy through the Brenner pass in 1940. Britain's blockade forced Mussolini to rely on Germany as almost the sole source of supply

Although there is some international trade in coal, the amounts are relatively so small that the United States is practically self-contained; imports are usually well under 1,000,000 tons and exports have ranged from a high of 24,000,000 tons in 1929 to a low of 10,000,000 tons in 1932, including bunker fuel and the coal equivalent of coke. The 1940 exports were naturally somewhat higher than usual, the total for the year approaching 20,000,000 tons.

The year 1940 started with the production level at about 10,000,000 short tons of bituminous coal weekly, gradually dropping through February and March to 8,000,000 tons during the second quarter; during the third quarter the 10,000,000 tons level was gradually regained, only to be broken by a heavy sag back to 8,000,000 tons during the first three weeks of October; the former level was regained in mid-November, and held to the end of the year. Aside from the variations mentioned, there were no marked breaks in the production trend except at the usual holiday periods. The first quarter decline was the usual seasonal drop from the winter to the summer rate of production, and the October break was due to the price situation. The government price fixing provisions were scheduled to go into effect the first of October, after having been postponed from the first of September. This having been postponed once, many buyers thought it might be done again, and sought to protect themselves against possible rise in price in the event that prices were not fixed, by making considerable purchases in advance. The prices were fixed at the time set, and this left those who bought in advance with stocks for some weeks to come, with the result that there followed a six weeks' period of slack buying and correspondingly low production. However, on the whole, production conditions were unusually sta-

ble during 1940, the spread between the minimum and maximum weekly outputs being less than for several years past. The production rate for anthracite was also more stable.

European Production.—Since the beginning of the war Sept. 1939 statistics of production have been suppressed in the major European producing countries, all of which were involved in the war, and in most of the minor countries from the time of their occupation by Germany; after some delay this procedure was also followed by the more important producing areas in the British empire, with the result that figures became available only for part of the year 1939. By Jan. 1, 1941, reports for a material proportion of the 1940 output were available only for Belgium.

Australasia.—The coal output of Australia was 17,184,000 long tons in 1939, and of New Zealand 2,342,000 tons.

Belgium.—Having borne the brunt of the German thrust to the west, it might be expected that Belgian industry would be pretty well disorganized, but curiously enough, this does not seem to have been the case. Production in 1939 was little affected by the outbreak of the war, the monthly average output during the last quarter being practically the same as that for the year.

U.S. PRODUCTION OF BITUMINOUS AND ANTHRACITE COAL. Source: Bituminous Coal Division, U.S. Department of the Interior.

and the year's total was 29,846,000 metric tons, only 1% over that for 1938. But for the outstanding application of the slogan "business as usual" one must turn to the period immediately following the invasion of Belgium, early in May. It is true that instead of the usual monthly reports of output, the May and June reports were consolidated into a single total, but this total was 3,870,000 tons, against 2,832,000 tons in April, a drop of only 26%. In June the monthly reports were again back on schedule, though output had dropped to 684,000 tons, and each succeeding month showed marked improvement, until for September, the last to be received (Jan. 1, 1941), the output had climbed to 2,229,000 tons, 15% below the April figure. The total for the nine months was 18,429,000 tons, or at the rate of 24,600,000 tons for the year, 15% less than for 1939.

Canada.—From preliminary figures for 1940 an output of 17,420,000 tons is estimated for the year, a 10% increase over 1939. Imports increased heavily in the second and third quarters, but declined in the fourth; the total for the year will exceed 18,000,000 tons, up one-third from 1939.

India.—Production in 1938 rose by 13% to 28,343,000 tons; no total is available for 1939, but such data as were at hand (Jan. 1, 1941) indicated little change from 1938, and in the first half of 1940 the production rate rose about 5%.

Netherlands.—Production dropped 5% in 1939, to 12,681,000 metric tons. Imports during the year, including the coal equivalent of coke and briquettes, were about 7,000,000 tons and exports about 6,500,000 tons.

South Africa.—Production in 1939 increased 5% over 1938, to 21,524,000 short tons, and to 9,176,000 tons in the first half of 1940. Sales in the first three quarters of 1940 were 14,125,000 tons, or at the rate of 18,800,000 tons for the year. (See also FUEL BRIQUETTES.) (G. A. Ro.)

Coast Guard, U.S. On Aug. 4, 1940, the coast guard celebrated its 150th anniversary. Its antecedent, the U.S. revenue cutter service, was organized after the American revolution by an act of congress approved by President Washington Aug. 4, 1790. The sesquicentennial year was marked by an addition of national defence duties to the usual peacetime activities of enforcing all federal laws on navigable and territorial waters and safeguarding the security of vessels in U.S. waters. During the year the personnel was increased by national defence appropriations to provide for an average enlisted force of about 15,000 men for the fiscal year 1940-41. Of the \$10,700,000 appropriated by congress for defence activities of the coast guard, approximately \$8,200,000 was scheduled

to pay for emergency conversion of coast guard vessels for naval use. This work included revision of armament, installation of guns, enlargement of magazines and other structural changes on the cutters and patrol boats.

A major activity of the coast guard during 1940 was its neutrality patrol, established in 1939 to prevent any belligerent from using U.S. ports for unneutral acts. Because of the almost total lack of meteorological data normally supplied to the U.S. weather bureau by ships of all nationalities at sea, the coast guard set up an Atlantic weather patrol in Feb. 1940. Two cutters were equipped as floating weather bureaus and stationed between the Azores and Bermuda to collect and transmit data. By presidential proclamation of June 27, 1940, the coast guard was charged with supervision of the anchorage and movement of vessels and the loading and unloading of vessels with explosives and other dangerous cargoes.

In the fiscal year 1939-40 the coast guard rescued 9,249 persons in peril, assisted 32,084 persons aboard vessels, cared for 410 persons in distress, assisted vessels and cargoes valued at \$88,016,268, boarded and examined papers of 39,450 vessels and seized 21 vessels.

A total of 1,581 aids to navigation, principally daymarks, buoys and minor lights, were established during the year and 767 aids were discontinued, leaving a net increase of 814 and a net total of 30,420. Relief forces were dispatched to aid sufferers from the Susquehanna river flood in April 1940, and considerable planning was undertaken for coast guard activities in future floods.

At the end of its first year on Oct. 5, 1940, the newly-established coast guard reserve numbered more than 3,000 men. This organization was created by congress to educate yachtsmen and other small boat operators in the proper handling of their craft. (R. R. W.)

Coast Guard Academy, U.S. The largest entering class in the U.S. Coast Guard academy's history—147 cadets—began its training at the academy in 1940. This class represented the top contestants among the 1,763 who took the nationwide competitive examinations for admission to the academy.

The congressional board of visitors, after its annual inspection of the academy May 3, 1940, recommended the appropriation of an additional \$1,000,000 for expansion of the educational program made necessary by increased enrolment of the cadet corps.

NEWEST AIR STATION of the U.S. Coast Guard, dedicated Oct. 17, 1940 at Elizabeth City, North Carolina

In its report the board commented on the high educational standards of the institution.

As a result of the Engineering Council for Professional Development's inspection of the Coast Guard academy in 1940, the academy was certified and classed among the upper 10% of technical colleges in the United States.

During the year the academy was also approved by the Association of American Universities as an institution having the right to grant the degree of bachelor of science. This approval places a graduate of the Coast Guard academy on the same footing as the graduate of an accredited civilian university.

The annual practice cruise of the first and third classes took place during the summer aboard the cutters "Saranac" and "Sebago." During this cruise the cadets visited the west coast and several ports of Spanish America.

Total enrolment at the beginning of the fall semester in 1940 was 287, of which 24 were in the first class, 36 in the second class, 84 in the third class and 143 in the beginning class. Four of the original 147 in the beginning class dropped out before the start of the term.

(R. R. W.)

Coaxial Cables: see TELEPHONE: *Coaxial Cable*.

Cobalt. World production of cobalt was estimated at 4,800 short tons in 1939, including approximately 1,700 tons from Northern Rhodesia, 1,400 tons from the Belgian Congo, 800 tons from French Morocco, 366 tons from Canada (for many years the leading producer), and 250 tons from Burma. The chief metal use is in the so-called stellite alloys, combinations of cobalt and chromium, with sometimes other metals added, and in special alloy steels, mainly for permanent magnets. The most used compound is the oxide, which has long been a standard blue colouring agent in the glass and ceramic industries, while smaller amounts of other compounds are used as driers in paint and varnish.

(G. A. Ro.)

Cochin-China: see FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). As a "comparatively unessential" commodity cocoa in world trade was severely restricted in 1940 by governmental regulations, shortage of shipping and the British blockade. As of Sept. 1, 1940, the British government took control of cocoa in the United Kingdom and rationed supplies to manufacturers on an annual basis of 100,000 tons, about 20% under current consumption. Early in the year the British government announced it had bought the 1939-40 Gold Coast main crop of cocoa at approximately £16 per ton to protect growers in British West African mandates. During the war of 1914-18 cocoa sold as low as £4 per ton. The main 1939-40 crop in the Gold Coast and Togoland was estimated at 235,000 long tons. Later, in May, the government announced it would buy the light intermediate crop in Nigeria, estimated at 10,000 tons, at £10 per ton for destruction. Before the European war Germany consumed about 15% of world production of cocoa. With Germany and other European countries out of the market, growers throughout the world faced disaster. In Brazil, exports the first seven months of 1940 were 459,128 bags of 60kg. each, compared to 840,096 bags in the same period in 1939. In an effort to relieve growers the Brazilian government took charge of exports. The 1939-40 main crop in Brazil was estimated at 1,900,326 bags. The Dominican Republic's main crop was 21,000 metric tons. Exports from Ecuador the first seven months of 1940 were 6,389,238kg. (11,531,353kg. in the same period in 1939).

(S. O. R.)

Coco-Nuts. Of all agricultural products that enter into international trade, coco-nuts were among those most

adversely affected in 1940 by the European war. So large was the surplus stocks of coco-nut products in the Philippine islands that copra prices in August sank to an all-time low and copra cake was being used for fuel, with an over-supply even for that form of consumption. Normally copra cake and meal are exported from coco-nut growing countries to be used as cattle feed. In 1940 many countries found their markets for coco-nut oil, copra and cake in Europe almost completely cut off. The market for oil and copra in the United States was also severely affected by an abundance of lard, cotton-seed oil, soybean oil and other vegetable oils that compete with coco-nut oil in the manufacture of oleomargarine and cooking fats. Lard exports from the United States were a substantial competitor against coco-nut oil in Latin America. Heavy increases in ocean freight rates also curtailed coco-nut products shipments. In May 1940, rates from the Philippines to U.S. Pacific coast points were increased from \$9.50 to \$13.50 per ton for copra, from \$8 to \$11.50 per ton for copra meal, and from \$15.50 to \$20 per ton for oil. Manufacturers of desiccated coco-nut continued to operate at capacity in the Philippines owing to the cheapness of coco-nuts, but the market for desiccated coco-nut in the United States was thereby threatened with an over-supply. World production of coco-nuts, in terms of copra, is approximately 7,333,000,000lb. a year. Of this the Netherlands Indies produces about 25%, the Philippines 22%, British India 18%, Ceylon 9%, Malaya 8%.

(S. O. R.)

Coffee. A new use for coffee, as raw material for the manufacture of plastics, was initiated in 1940 when the Brazilian government bought the patents for a newly-developed process of plastics manufacture and began in August the erection of a plant to convert green coffee beans into plastics for use in radiolux automobiles, telephones, etc.

The new plant is at São Paulo, Brazil, and is designed to produce 37,000 bags (133lb. to the bag) of coffee a year. If the enterprise is successful the plant will be expanded. The new plastic is called "cafelite."

The Brazilian government annually spends millions of dollars to take surplus coffee off the market and destroy it. From 1939 up to Feb. 29, 1940, it had bought and destroyed 9,100,000,000 lb. of coffee.

World production of coffee in the crop year ending in 1940 was reported by the International Institute of Agriculture, Rome,

Table 1.—Production in Principal Coffee Countries for 1939-40

	13,228,000	0.3%	13,228,000	13,228,000

Production in the principal coffee countries in 1939-40 and 1938-39 and the average for 1936-40 were reported as in Table I by the International Institute of Agriculture.

Table I omits smaller producers such as Peru, Bolivia, Netherlands Guiana, Trinidad, Tobago and others and therefore the grand total is less than that of Table II. Brazilian 1940 production was officially estimated at 2,892,000,000 lb. which the International Institute of Agriculture considered too high because of unfavourable drying weather and, therefore, gave a smaller estimate of 2,755,000,000 lb. The Brazilian carry-over was 93,000,000 lb. Brazil in 1940 extended the prohibition against new coffee planting to June 30, 1941. The government also provided extraordinary war-risk insurance, indemnities to be paid in coffee where loss was from torpedoing or confiscation. Larger American producing countries continued or adopted government support for coffee growers in 1940, including provision for a coffee planters' bank in Cuba. The Mexican government is endeavouring to extend coffee cultivation. Coffee was rationed in 1940 in Italy and Sweden and in Germany a considerable coffee substitute industry was built up. Canada placed a war tariff on coffee imports. (See also BRAZIL; GUATEMALA.) (S. O. R.)

Coinage. The United States mint service is an adjunct of the treasury department. It consisted in 1940 of eight field institutions in widely scattered localities, administered by the director of the mint, from the bureau of the mint in Washington. The eight institutions were three coinage mints, in Philadelphia, Pa., Denver, Colo., and San Francisco, Calif.; assay offices in New York, Seattle, Wash., and New Orleans, La.; a bullion depository for storage of gold, at Fort Knox, Ky., and a bullion depository for storage of silver, at West Point, N.Y.

Coinage.—Coinage manufactured by the U.S. mints for the United States during the calendar year 1940 was the largest in the history of the mint, amounting to 1,209,478,982 pieces, valued at \$50,157,850.32.

Half dollars	13,717,279 pieces
Quarter dollars	46,756,846 pieces
Dimes	108,119,827 pieces
Nickels	259,729,158 pieces
Cents	781,155,872 pieces

The nickel was the Jefferson design, adopted in 1938; it superseded the buffalo nickel, which, however, continued in circulation.

All mint records for monthly coinage in the United States were broken in Dec. 1940, when 199,453,615 pieces were struck, the largest production in any one month since the founding of the mint in 1792. September production was the second largest in mint history, reaching 171,067,068 pieces.

Coinage executed for foreign governments amounted to 33,170,000 pieces. The U.S. mints in 1940 executed coins for El Salvador, Indo-China, Nicaragua and Panama.

Gold and Silver Acquisitions.—Gold acquisitions by the mints and assay offices of the United States, during the calendar year 1940, amounted to approximately \$4,351,000,000. Silver acquisitions of the mints and assay offices of the United States in 1940 amounted to 212,400,000 ounces (approximate).

(N. T. R.)

Coke. The production of coke centres in the more heavily industrialized countries, particularly those with a large pig iron output. World production, including both oven coke and gas-house coke, decreased about 14% in 1938, to an estimated 165,000,000 metric tons, the approximate distribution being: United States 19%; Germany 31%; United Kingdom 16%; U.S.S.R. 12%; France 6%; Belgium 3%; Japanese empire 2%; Netherlands 2%; India, Canada, Poland, and Italy 4%. Figures are incomplete for 1939, but there was an increase in the larger producers, except Russia.

The United States produced 44,327,000 short tons of oven coke in 1939, of which 97% was by-product and 3% beehive, and an additional 3,406,000 tons of breeze; this is an increase of 36% from 1938. Of the total consumption, 70% was used in the production of pig iron and ferro-alloys. Production recovered still further in 1940, the output for the first 11 months being 31% above that for the corresponding period in 1939; this should give a total for the year that just about equals or possibly slightly exceeds the former record high of 56,478,000 tons, made in 1918. Foreign trade plays very little part in the industry, exports and imports each being of the order of 1% of the output. Coke production took 16% of the bituminous coal production of the United States in 1939, aside from that used in gas works.

Germany is normally the second largest producer of coke, but the reduced output in the United States in 1938 left Germany in the lead; in 1938 oven coke increased 6% to 43,511,000 metric tons; in addition, gas works coke is approximately 5,000,000 tons, and brown-coal coke 2,000,000 tons. Germany is a heavy exporter of coke, but net exports in 1938 took only 12% of the output, as against 20% in 1937.

Data for 1939 include only through July, with output 4% above the 1938 average.

Coke production decreased 7% in the United Kingdom in 1938, to 26,699,000 long tons, including 12,843,000 tons of gas-house coke, 12,645,000 tons of by-product, 180,912 tons of beehive, and 1,030,000 tons of breeze. Coke production consumed 17% of the bituminous coal output in 1938. Coke exports were 1,991,000 tons.

(G. A. Ro.)

Cold, Common. New studies were reported in 1940 on constitutional factors which predispose to the common cold. These included abnormal vasomotor reactions, i.e. control of the blood vessels, examples of which are blushing and pallor, minor disorders of the endocrine system and of the acid base metabolism. At least one group of observations on school children supported the theory that a variety of micro-organisms may act as the inciting agent in the production of common colds.

Reports during 1940 on the value of vaccines continued to give mixed results. Dochez, using a cultivated filtrable virus, produced immunity in animals for a period of 18 months but failed to produce any immunity in human beings. Others using the virus produced immunity to artificially produced but not to natural colds. Stafford immunized a group of students with a bacterial vaccine so that the number of severe colds and total days of illness were only one-fifth of that suffered by a group not vaccinated.

On the other hand Diehl and his associates produced no worth-while immunity with a variety of bacterial vaccines.

Neoprontosil (of the sulphanilamide family) nasal sprays have been recommended to reduce congestion in acute stages of head colds. Avoidance of pneumonia may be accomplished, it is suggested, by administering small doses of sulphapyridine thereby reducing the number of pneumococci in the nose and throat of the cold sufferer.

Collins, Edward Day (1869-1940), twice acting president of Middlebury college, was born at Hardwick, Vt., Dec. 17. He was graduated in 1896 from Yale, which gave him his Ph.D. three years later. After teaching history at Yale for two years he entered business, resuming teaching in 1909 when he became professor of pedagogy at Middlebury, serving successively as acting president, provost and controller. He retired from college work in 1923 and devoted himself to the development of École Champlain, a French camp for girls. He died at Middlebury, Jan. 1.

Colombia, a republic in northern South America bordering both the Caribbean and the Pacific; language, Spanish; capital, Bogotá; president, Dr. Eduardo Santos; area, 448,794 sq.mi. The population was 8,724,839 according to the census of 1938. The principal cities are: Bogotá, 331,400; Medellín, 170,622; Barranquilla, 152,348; Cali, 110,579; Cartagena, 86,197; Manizales, 83,346; Ibagué, 61,860; Cucuta, 57,251; Bucaramanga, 49,891; Pasto, 49,533; Neiva, 34,699; Santa Marta, 33,163; Popayán, 24,479; Tunja, 20,417. Population is very largely concentrated on the eastern Andean plateau, the interior departments of Antioquia and Caldas, and the upper Cauca valley.

History.—The year 1940 was marked in Colombia by sharp and frequently acrimonious disagreements and splits within the ranks of the Liberal party and, to a lesser degree, in the Conservative (opposition) party, with the differences arising from disagreements on internal as well as external policies of government. The chief source of friction was the prospective candidacy of former president López, representing the more leftish wing of the Liberal party, in the presidential election of 1942. President Santos, a moderate Liberal, held relatively aloof, but a majority of the Liberal members of congress went on record as favouring López. In September, however, a temporary Conservative and moderate Liberal coalition in the lower house of congress gained control of the house's organization. A few weeks later, Laureano Gómez, leader of the Conservative party, declared López' return to the presidency would invite civil war. Gómez likewise was strongly critical of President Santos, whom he bitterly attacked for his strong support of western hemisphere solidarity and friendship with the United States. In so doing Gómez tended to link himself and the Conservative party with pro-nazi and fifth-column elements, whose activities were strongly opposed by the government. For this he was strongly criticized by important sections of his own party. In May and June, especially, national attention was focused on fifth-column activity. Charges were freely made that former personnel of the German-owned SCADTA airline, whose services were taken over by the Pan American airways, and German commercial agents in the country were plotting eventual political domination of the country. Anonymous handbills were circulated declaring that, upon German victory in Europe, Panama would be restored to Colombia. Upon Italy's formal entry into the European war, serious anti-Italian rioting occurred in Bogotá. In June President Santos defended his support of Pan-Americanism, declaring it a policy "based on the realities and needs of the continent." In other respects Colombia acted in close accord with the United States, supporting that country at the Havana conference.

In June the government announced a far-reaching economic and financial program creating facilities for medium and long term credits to farmers and cattlemen, and giving state aid to agriculture, cattle raising and manufacturing, and accelerating construction of railways, highways and other public works. Likewise, efforts were made to shift the country away from single crop economy. To this last end, in conjunction with the Inter-American Coffee Quota agreement, a system of price and export control of coffee was inaugurated in November. Introduction of new crops, as rubber and quinine, were encouraged through government financial aid.

Education.—In 1938 there were 9,208 primary schools (enrolment 627,730), largely supported by the national and local governments; 401 secondary schools (enrolment 33,730), over 75% of them privately controlled, but with government financial assistance and determination of standards; and 21 normal schools with 2,633 students. Numerous commercial, night, art and other schools made a grand total of 10,483 schools (enrolment 717,051). Between 1934 and 1938 primary school enrolment increased 14.6%, secondary and normal school enrolment by nearly 16%. The National university at Bogotá and the University of Medellín are the most important of the country's several universities.

Finances.—The monetary unit is the peso (value: 58 cent U.S.). During 1940 Colombia received a \$10,000,000 loan from the United States Export and Import bank. In December, after a temporary resumption of payments on defaulted bonds, a permanent arrangement was effected, under which, beginning Feb. 15, 1941, annual payments would be made which would amortize \$45,000,000 of bonds over a 20-year period. The total debt of the republic aggregates an approximate \$54,000,000, but departmental and other bonded indebtedness guaranteed by the central government bring the total to an approximate \$150,000,000, not including heavy accrued interest. A sterling indebtedness of £2,666,290 is in similar default.

Trade and Communication.—Colombia's external maritime communication is mainly through Cartagena, Barranquilla and Santa Marta on the Caribbean, and Buenaventura and Tumaco on the Pacific. Highways connect the country with Ecuador and Venezuela. Air transport looms large in the country's international communications, as well as in internal, owing to the inadequacy of land routes from the coast to the interior plateau where the great bulk of the population is centred. In 1938 railroads in operation totalled 3,282 km. The national highway system included 7,507 km. in operation, 2,796 km. under construction, and 4,648 km. projected. Departmental highway systems included 4,844 km. in operation and brought the grand total to 12,340 km. in operation, 4,874 km. projected. There are short aerial cableways for freight and passenger transportation measure 88 miles. The Magdalena river is still an important commercial artery, despite difficulties of navigation during the dry season.

In 1939, imports (largely textiles and other manufactured goods) totalled 183,462,000 pesos (15.2% over 1938), with the United States leading (54.0%), followed by Germany (12.8%) and Great Britain (9.5%). Exports, including 40,582,000 pesos in gold bars, were 177,054,000 pesos, an 8.5% increase, with the United States taking 66.9%, followed by Curaçao, Germany and Canada. In 1939 coffee comprised 49.2% of all exports, petroleum 18% and bananas 4.9%. In the first half of 1940, with a sharp decline in coffee shipments, exports declined nearly 15%. Petroleum export, however, increased.

Agriculture and Mineral Production.—In addition to the principal agricultural exports, Colombia produces sugar, wheat, rice, cotton, cacao and tobacco, largely for domestic consumption. Mineral resources are extensive. Colombia is ninth in world petroleum

leum production (1939: 23,774,150 bbl.; 1940 est.: 26,864,400 bbl.); second in platinum and first in emeralds, while gold is also extensively mined. The coffee industry is the main basis of the national economy, however, as it is Colombian-owned, while the petroleum, banana and platinum industries are largely foreign-owned.

Under the Inter-American Coffee Quota agreement of Nov. 1940, Colombia is allotted 3,150,000 bags (of 60 kg. each) for export to the United States, 5% less than actual export in 1938. Manufacturing for domestic consumption is on the increase. In June 1940 the Industrial Development institute was established to encourage domestic manufacturing and stimulate development of mineral resources, with power to grant certain tax exemptions and other financial aids. (L. W. BE.)

Colorado, a Rocky mountain state of the United States, popularly known as the "Centennial state," admitted to the Union in 1876; area 103,658 sq.mi., one-third occupied by mountains; highest mean elevation of all states in the Union, 6,800 feet. Population (1940) 1,123,296; urban population slightly larger than rural; whites 90% of total, Mexicans 5%, remainder Indians, Negro and scattered. Capital and largest city, Denver, 322,412.

History.—State officers were in 1940: Ralph L. Carr (R.), governor; John C. Vivian (R.), lieutenant governor; Walter F. Morrison (R.), secretary of state; Charles M. Armstrong (R.), state auditor; Homer F. Bedford (D.), state treasurer; Gail L. Ireland (R.), attorney-general; Mrs. Inez Johnson Lewis (D.), state superintendent of public instruction. In the 33rd General Assembly, convened Jan. 1, 1941, the senate was Democratic and the house Republican. In the 1940 presidential election the returns for Colorado show 278,855 votes for Mr. Willkie and 265,364 for Mr. Roosevelt. Principal legislative measures with political significance: reorganization of state government and continued diversion of income taxes from school funds to state general fund to offset demands of public assistance program.

Public Assistance.—In Jan. 1940, 53,647 households were receiving assistance (pensions, dependent children's aid, aid to the blind, tuberculosis hospitalization and direct relief), the cost of these activities in 1939 having been \$19,259,429, including \$6,528,296 in federal grants. The number receiving old-age pensions increased from 37,960 in Jan. 1939 to 40,168 in Jan. 1940. Although the pension amendment, twice upheld by popular vote, provides for \$45 a month, average 1939 payment was \$29.55, due to insufficient income. Colorado's pension payments are second highest in the United States.

Water Development.—In addition to projects costing more than \$2,000,000 completed in 1939 for storage of irrigation water, projects totalling more than \$60,000,000 in cost were under construction in 1940 for transmountain diversion, flood control and storage. The largest are the Colorado river diversion through the mountains to the South Platte valley and the combined irrigation storage and flood control project on the lower Arkansas river, near the Kansas line.

Highways.—Following completion of the \$25,000,000 highway construction program in 1939, funds for road construction were curtailed by the demands of debt service. Including federal aid, construction in 1939 totalled \$9,009,000 and in 1940, \$8,540,500. Construction of the primary highway system is now considered about 85% complete.

Public Buildings.—The program of new construction at 21 state institutions continued through 1940 under the terms of a 10-year financing plan established in 1937. Some revision of original allotments was for the last five years of the period to meet changing conditions.

Agriculture, Manufactures, Mineral Production.—Farm products, \$134,265,000; manufactures, \$237,838,000; tourist business, \$73,000,000; all minerals, \$60,403,000; 145 banks with total assets of \$379,735,800. (E. D. F.)

Columbia, District of: see WASHINGTON, D.C.

Columbia University, in New York city, had in 1940-41 a registration of 31,411 resident students, including the summer session of 1939; there were 10,568 students in the summer session in 1940. The total number of officers of administration and instruction was 3,317. There were 70 university buildings on Morningside Heights. In 1940 the university capital endowment was \$87,995,257.73 and the total resources were \$155,071,205.43.

The budget appropriation for 1939-40 was \$14,929,915.69. Tuition fees range from \$400 to \$553. Its library numbered 1,710,062 volumes. A new building, Brander Matthews hall, erected on 117th street, provides for the theatre arts work of the university. Earl hall, formerly used in large part for dramatic work, has been restored to its original purpose, a centre of the religious life of the university. New educational experiments were begun at Bard college at Annandale-on-Hudson. The Columbiana collection, the university archives, was transferred to new and enlarged quarters in the Low Memorial library.

Celebrations were held upon the 50th anniversary of the founding of Barnard college and upon the 75th anniversary of the school of mines. (M. H. T.)

Columbium. Columbite recovered by retreatment of tailing piles at tin mines in Nigeria is the world's chief source of columbium, but it is also found associated with tantalum in ores from the Belgian Congo, Australia, Uganda, South-West Africa and Brazil.

Shipments from Nigeria were discontinued after the outbreak of war in Europe, exports for 1939 amounting to 231 long tons, against an output of 431 tons. The metal is sold mostly as a ferro-alloy containing 50-55% Cb, for use as an addition agent to stainless steels for the reduction of intergranular corrosion, and was quoted throughout 1940 at \$2.25-\$2.35 per pound of contained columbium. Pure metal was quoted at \$560 per kilo for rod, and \$500 for sheet. (G. A. Ro.)

Commonwealth Fund, The. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, president of the fund from its inception until his death on Jan. 29, 1940, amounted in 1940 to approximately \$49,000,000. In 1940 the fund appropriated some \$2,000,000. Of this total more than two-thirds was devoted to the promotion and maintenance of physical health. Appropriations for needs arising out of the war amounted to \$135,000.

Public health activities, designed to raise standards of rural service, centred in Tennessee, Mississippi, Oklahoma and Alabama. The 12th in a group of rural community hospitals built

or remodelled with aid from the fund was opened in 1940; two more were under way. Some \$450,000 was given for medical research. The Commonwealth fund fellowships for British graduate students at American universities were curtailed but not suspended. The fund continued to aid child guidance enterprises in England; maintained an advisory service for community mental hygiene clinics in the United States; supported studies in administrative law and legal history; and published in 1940 11 books and pamphlets of educational significance in its fields of operation. The directors of the fund were in 1940 Malcolm P. Aldrich, president; Robert A. Lovett, vice-president and treasurer; Phil W. Bunnell, Samuel H. Fisher, George Welwood Murray, Dean Sage and William E. Stevenson.

Communism, or revolutionary Marxism, is a system of government evolved under the leadership of Lenin and Stalin in the soviet union. Communism believes in the dictatorship of the proletariat for a transitional period, after which a free society would come into existence in which everybody would contribute to the common weal according to his capacities, and receive a reward according to his need. This ultimate goal seemed in 1940 still very far away in the soviet union; meanwhile the soviet union represented a dictatorship of the Communist party with state ownership of all the important means of production. Communism proclaims the equality of all peoples and races and believes in the final establishment of a peaceful international order. Within this general frame communist policy has undergone several fundamental and sometimes sudden changes since 1920. The last of these so far occurred in Aug. 1939, when the soviet union, and with it all the communist parties throughout the world, abandoned the pretence of collaboration with the democratic nations and struggle against fascism, and lined up side by side with aggressive fascism which they had proclaimed until then as the mortal enemy of the proletariat, of peace and of progress. Since then, and during 1940, the Communist party everywhere has played a rather enigmatic and ambiguous role; nevertheless it has directed all its main attacks against democracy, against Great Britain's effort to resist fascist aggression, and against the defence program of other democracies, including the United States, to prepare themselves against similar fascist aggression. At the same time, the spirit of co-operation between fascist Germany and the communist soviet union was emphasized repeatedly. Even the conclusion, on Sept. 27, 1940, of a formal alliance of the three great fascist powers, Germany, Japan and Italy, which fundamentally represented the revival of the old anti-Comintern pact, did not lead to any estrangement between national socialist Germany and communism, although the hopes for closer co-operation between the soviet union and fascist Japan were not in 1940 realized. A visit by the prime minister and foreign secretary of the soviet union, Mr. Molotov, to Chancellor Hitler in Berlin on Nov. 12, 1940, did not bring any new elucidation of the communist stand, and the subjects and results of their talks remained unknown.

Several changes in the high command of the Communist party were indicative of changes in policy. Vice-Commissar of Foreign Affairs Vladimir P. Potemkin, who had been the collaborator of Maxim Litvinov, was transferred on Feb. 29 from his post to the minor one of commissar of education of the Russian Socialist Federated Soviet Republic. On May 8 Marshal Klementiy E. Voroshilov, who had been people's commissar of defence for 15 years, was named vice-premier, and Marshal Semyon Timoshenko took his place. The next day the soviet army ended the divided commands under which political commissars had wielded wide power, and fuller authority was given to the military officers. The generals and admirals of the red army and of the red navy

were re-instituted to full military authority and responsibility. The soviet press hailed this return to the old order and assailed its own former standpoint as "ossified dogmas." The measure was intended to strengthen the discipline of the fighting forces. A step of a similar nature was taken when on Oct. 3 the soviet system of free universal education in all grades was altered to require payment of tuition in high schools and colleges. Students in the eighth, ninth and tenth grades were ordered to pay 200 roubles yearly in the cities and 150 in the towns and villages, while tuition in the colleges amounted to 400 roubles yearly, and in the art, music and theatre schools to 500 roubles. The change was motivated officially by the increased expenses of the government and by the rising material level of the workers, though the standard of life in the soviet union still remained extremely low. On the 23rd anniversary of the foundation of the soviet union the usual military parade was accompanied by the proclamation of full preparedness on the part of the soviet union and the need of "maximum vigilance in an exceptionally alarming international situation."

While communism in the soviet union thus armed to the utmost and enforced the strictest labour discipline in the factories and military discipline in the armies, communists outside the soviet union conducted a violent propaganda campaign against the full rearmament of the democracies, against discipline in the factories, and often tried to sabotage all efforts to put the democracies on a basis of preparedness similar to that which the soviet union boasted. Communists in France co-operated with the fascist groups in undermining the will to defence of the French people, and especially of the French working class, against national socialist Germany. In Great Britain the communists were in the front rank of the "appeasers," pleading for the immediate cessation of hostilities against Germany. In the United States, and similarly in other American republics, the Communist party pursued a similar policy, aligning itself with the "appeasers" of the right wing, protesting the rearmament, and trying generally to undermine the will to and preparations for resistance to fascist aggression, as they had done in France. To that end they were ready to co-operate with extreme pacifists and with pro-fascist groups.

Communism extended its hold through the incorporation of southern Finland, Bessarabia, northern Bukovina, Lithuania, Latvia and Estonia into the soviet union. These newly acquired territories were quickly subjected, as eastern Poland had been in 1939, to a complete co-ordination of their political, cultural and economic life along communist lines. In all fascist countries communist activities were strictly forbidden, though Chancellor Hitler seemed ready to make use of communism to disintegrate the nations which he considered antagonistic to his aspirations. General Ludendorff had used Lenin and his fellow-communists for the purpose of disintegrating Russia in 1917. Chancellor Hitler apparently thought Germany immune to communist penetration while he favoured the propagation of communist social revolutions outside Germany. In democratic countries the Communist party, as a result of its dubious attitude in the struggle between fascism and democracy, made hardly any headway, although it was given full liberty of action in Great Britain in spite of the serious war situation. In the United States the Communist party, in order to escape the requirements intended for groups under foreign control, dissolved its formal ties with the soviet union, because the cause of proletarian internationalism would best be served by temporarily severing all affiliations with the communist international. Similarly the official organ of the Communist party in the United States, the *Daily Worker*, was constituted as the private property of three individuals. The Communist party participated in the presidential elections of Nov. 1940. In

candidate was, as in 1936, Earl Browder. In spite of the fact that the party was not admitted to the ballot in all states, the party received 48,789 votes, as compared with 80,159 in 1936 and 102,991 in 1932. (See also DEMOCRACY; FASCISM; PACIFISM; SOCIALISM.)

(H. Ko.)

Communist Party.

Outside the U.S.S.R. and the territories it acquired during 1940, the Communist party continued its decline in influence which began with the Russo-German pact of non-aggression in 1939. In the U.S. national election of Nov. 5, 1940, Earl Browder, the party's presidential candidate, and James W. Ford, a Negro from New York who ran for vice-president, polled 48,789 votes. In 1936 the communist presidential vote was 80,159; in 1932, 102,991. The party appeared on the ballots of only 22 states, having been barred in some (notably New York and Illinois) and having failed to qualify in others by securing the required number of petitions. Of the states which permitted balloting for Browder and Ford, California tabulated the largest number of communist votes (13,586), with New Jersey second (8,814) and Pennsylvania third (4,519). The party failed to qualify in Ohio. During 1940, Browder, for reasons of political expediency, dissolved the party's ties with Moscow.

In Mexico, President Avila Camacho made a pre-election promise on Sept. 19 that communists would hold no official positions in his administration. France's stringent control of communist activities, begun after the start of war in 1939, did not change after her defeat by Germany.

Thousands of Moscow's adherents were arrested or interned during a series of raids in October. In May Great Britain began a round-up of communists and fascists as a precaution against fifth-column activities after the start of Germany's big military drive to the west. Ted Bramley, leader of the communist party in London, was arrested May 26.

Community Chest,

a term used to describe a local co-operative organization of citizens and social welfare agencies. It has two general functions: (1) to raise funds each year by a community-wide appeal for affiliated social welfare and health agencies and to distribute those funds by a budget procedure; and (2) to promote the social welfare and health of the community by co-ordinating services, improving standards, studying local problems and developing better public understanding. Closely allied with the community chest is the Council of Social Agencies.

In 1940 there were 550 community chests, 534 of them in continental United States, one in the Virgin Islands, two in Hawaii, 11 in Canada and two in South Africa. Almost every city in the United States with more than 100,000 population has a community chest or similar plan of federated financing for its voluntary welfare services. In 1940, 552 campaigns were reported, raising a total of approximately \$86,000,000. The 523 chests reporting campaign results for both 1939 and 1940 showed an average increase of 3.5% for 1940 as compared with 1939.

The all-time peak for community chests was \$101,181,949, raised in 1932 when private agencies were trying to cope with unemployment relief before Federal relief was under way. Subsequently chest funds declined somewhat until 1936. In that year the decline halted and chest funds have increased steadily since, with the exception of a lag of about 3% in 1939 below 1938, when they had reached 90.2% of 1929 funds.

Community Chests and Councils, Inc., 155 East 44th st., New York city, the national organization of community chests and councils of social agencies, was organized in 1918 as a clearing house for information for the 21 chests then organized. There are 346 community chests and councils of social agencies affil-

ated with the organization on a voluntary membership basis. A board of directors and an executive committee composed of chest and council laymen and executives guide the organization's policies. It is financed by dues from its corporate members.

An important activity of Community Chests and Councils, Inc., is administration of the annual Community Mobilization for Human Needs, which is sponsored by 36 co-operating national social agencies to give nation-wide backing to local campaigns.

Officers for 1940-41 are George E. Vincent, honorary president; Robert Cutler, president; John Stewart Bryan, Kenneth Sturges, vice-presidents; J. Herbert Case, treasurer; Lynn D. Mowat, secretary.

Allen T. Burns is executive vice-president.

(A. T. B.)

Community Trusts.

Philanthropic resources lodged in 78 community foundations established since 1914—principally in continental United States but with several in Canada and one in Hawaii—rose in 1940 to approximately \$52,000,000.

The aggregate resources of community trusts reached \$25,000,000 in 1928 and \$50,000,000 in 1939. Their combined appropriations in 1939 totalled \$1,278,000. The largest of these foundations, measured by capital held at the beginning of 1940, were the Chicago Community trust with funds aggregating \$9,700,000 and the New York Community trust with assets of \$8,800,000, followed by those in Cleveland, Boston, Winnipeg, Indianapolis and Minneapolis.

Congregational Church.

There are in the United States 6,041 churches with 1,049,575 members in the Congregational Christian denomination. The records for 1939 show an increase of 6,299 in net membership of the churches. These churches raised \$1,907,439 for benevolences and \$14,767,254 for the support of the local congregations.

A Congregational church is a church of self-governing Christian believers organized on a democratic basis in close association with a great body of Congregational churches throughout the world, covenanting together for religious worship, work and fellowship, acknowledging Christ only as authoritative head. Congregational churches were first organized in England in the 16th century, in revolt against state control of religious worship, in the demand for personal Christian experience and in an effort to reproduce New Testament simplicity and democracy.

The old world and the new are indebted chiefly to Congregationalism for the establishment and progress of the principle of religious toleration. Congregationalism sailed to America in the "Mayflower" as the church of the Pilgrim Fathers. Settling first at Plymouth, then later fusing with the Puritan colonists that followed them, these founders of Congregationalism spread over New England and through their democratic ideals laid the foundations for the free church, the free state, the free school and the free social life of the country. The Congregational churches have been pioneer Protestant churches in the promotion of education, missions, evangelism and in movements for Christian union, religious progress and moral reform.

International Congregationalism maintains an international organization known as the International Council of Congregational Churches. This body meets once in ten years, and publishes a decennial volume on the life and work of the Congregational churches around the world. Normally, a meeting of this council would have been held in Wellesley, Mass., in 1940, but on account of war conditions it was postponed until peace comes.

The principal regions in which Congregational churches flourish are shown in the table.

Principal Locations of Congregational Churches and Membership

Countries	Places of Service	Members of Churches	Countries	Places of Service	Members of Churches
Africa	2,314	70,743	Jamaica	56	2,670
Argentina	39	2,040	Japan	198	32,740

Congressional Legislation: see LEGISLATION: Federal; UNITED STATES.

Congress of Industrial Organizations.

Probably the most significant thing in the affairs of the Congress of Industrial Organizations in 1940 was the retirement of John L. Lewis as president and the election of Philip Murray to succeed him.

Both members of the United Mine Workers of America, main-spring of the movement for industrial unionism which caused a split with the American Federation of Labor in 1935, these two men had been active co-workers for nearly 30 years. They presented a striking contrast, for Mr. Lewis was dramatic and emotional while Mr. Murray was soft spoken and reflective.

Meeting in Nov. 1940, at a time when national defence was a matter of intense interest, the C.I.O. convention, for the first time since it was established as a permanent organization in 1938, adopted a resolution denouncing all isms—communism, naziism and fascism. Previously it had attacked naziism and fascism only. Failure to include communism had evoked considerable criticism, including charges that the C.I.O. had unions which were communist-dominated. Such accusations have always been denied by C.I.O. officials.

Created by Mr. Lewis and a small group of leaders in the A.F. of L. in 1935 as the Committee for Industrial Organization, to work inside the federation as a lever to stimulate formation of industrial unions, the unions in this venture were suspended in 1936 and subsequently most of their charters were revoked. In 1938, retaining the same initials, the name was changed to that of the Congress of Industrial Organizations and Mr. Lewis, up to that time chairman, became its first president, being re-elected in 1939.

No current membership figure was announced at the 1940 convention, but unofficially it was claimed that the C.I.O. had 4,000,000 members. The C.I.O. was in 1940 no longer confined to or-

PHILIP MURRAY, new president of the Congress of Industrial Organizations, addressing the C.I.O. convention at Atlantic City, N.J., Nov. 19, 1940, shortly before his election to succeed John L. Lewis

ganizing workers into industrial unions, but it formed craft unions as well, rivalling the A.F. of L. (See also AMERICAN FEDERATION OF LABOR; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (L. STA.)

Connecticut, one of the original states of the United States, popularly known as the "Nutmeg state" and the "Land of Steady Habits"; land area, 4,820 sq.mi.; population (U.S. census, 1940), 1,709,242, an increase of 6.4% since 1930 as compared with 16.4% in the ten years preceding 1930. Capital, Hartford, 166,267. Other cities of over 50,000 population in 1940: New Haven, 160,605; Bridgeport, 147,121; Waterbury, 99,314; New Britain, 68,685. The 1940 census showed an increase of population in each of the eight counties and in 19 of the 24 urban communities of over 10,000, the larger increases being in the towns of West Hartford, West Haven, Stratford and East Hartford, all suburban communities. Aside from New Haven, the declines of population in five urban communities were less than 1,000 each. Of the state's population in 1940, 1,158,162 were urban, or 67.8%. In 1930 there were 1,576,673 whites; 29,354 Negroes; 1,222,267 native born; 384,636 foreign born.

History.—The principal state officers in 1940 were: governor, Raymond E. Baldwin; lieutenant governor, James L. McConaughy; secretary of state, Mrs. Sara B. Crawford; chief justice of the supreme court of errors, William M. Maltbie (term 1930-46). The above officers will be succeeded in Jan. 1941 by governor, Robert A. Hurley (Democrat, elected 1940, with 388,361 votes to 374,581 for Baldwin, Republican, and 18,090 for McLevy, Socialist); lieutenant governor, Odell Shepard; secretary of state, Mrs. Chase Going Woodhouse. The presidential vote of the state in 1940 was Roosevelt, 417,621; Willkie, 361,825. Francis T. Maloney, Democrat, was re-elected United States senator. The general assembly of 1941 will consist of 22 Democrats, 13 Republicans in the senate; 88 Democrats, 184 Republicans in the house.

The state income for the fiscal year ended June 30, 1940 was \$74,596,669.95 and the net expenditures were \$72,195,799.63, leaving a surplus in the general fund of \$1,748,808.18. The expenditures from the highway fund were \$20,964,984.96; from the building fund for construction and equipment of new institutional buildings \$12,078,901.37; from the Unemployment Compensation Benefits fund \$5,459,786.52 and from the Old Age Assistance fund \$5,418,611.77.

Education and Charities.—In the year 1939-40 the average daily attendance in public high schools was 79,662 and in other public schools 186,172. The school census of 1939 showed 242,427 attending public schools and 53,065 attending private schools and institutions. As a result of an extensive building program conducted by the state in co-operation with the Federal Public Works administration a new school was opened for feeble-minded at South Britain and a new veterans' home at Rocky Hill, and various new buildings and other improvements have greatly enlarged and improved the facilities at the University of Connecticut, at the state hospitals in Middletown and Newtown, at Long Lane farm for girls and at other institutions.

Banking and Finance.—On Sept. 30, 1940, the 72 mutual savings banks in the state had total deposits of \$742,861,831 and total assets of \$830,623,664, being a considerable increase over the previous year. The number of accounts increased to 984,506. In all but six cases the dividend rate was 2½%. The 64 state banks and trust companies had total assets of \$400,685,665, an increase of more than 10% for 1940. Hartford is the headquarters of most of the 25 large insurance companies operating under Connecticut charters. The five life companies of Connecticut wrote 11.12% of the new ordinary life insurance written through-

out the country in 1939 and had 11.01% of such insurance in force in all companies. The number of ordinary life policies issued in Connecticut in 1939 was 82,093, amounting to \$131,838,774, being a considerable increase over the preceding year, but the average life policy was \$1,606 as compared with \$2,079 in 1938. In 1939 Connecticut companies wrote 20.49% of all casualty business in the country. The figures for the Connecticut fire companies for 1939 were favourable, except for some decline in underwriting profit.

ROBERT A. HURLEY, a Democrat, was elected Connecticut's governor Nov. 5, 1940

Highways.—The final section of the Merritt parkway was opened to use in the summer of 1940 and work on its continuation, the Wilbur Cross highway, and on the new bridges across the Connecticut at Hartford and across the Thames at New London, has been in progress. The number of car registrations on Oct. 1, 1940 was 490,421, of licensed operators 564,433, and the number of miles travelled by motor vehicles on Connecticut highways 3,480,968,244. Each showed increases of about 6% over the same period of 1939 and constituted new records. The number of traffic accidents remained approximately the same as for 1939.

Agriculture and Manufacturing.—Agricultural production of the state in 1940 was good. The combined value of livestock products and crops exceeded \$50,000,000 annually. The dairy industry led with \$20,000,000, tobacco was second with \$10,000,000 and poultry raising third with \$9,000,000. In addition to tobacco, hay, potatoes and corn were the leading crops and fruit growing and gardening were extensively conducted. Pre-eminently a manufacturing state, Connecticut is an extensive beneficiary of the national defence program. Large contracts were let to industries in the state, especially in the fields of aviation, small arms and machine tools. By Oct. 1940 the volume of employment in Connecticut industries once more returned to the 1929 level.

Although the working day was much shorter, the daily and weekly earnings were higher than in 1929, and the volume of production greater.

While there was some increase in the number of labour disputes, the number of strikes during 1940 was less. (G. M. DU.)

Conservative Party. For the third successive year the holding of the British Conservative party's annual conference was cancelled in 1940, but the organization in the constituencies was effectively maintained although the local associations largely transferred their attentions from political work to the various war activities. By the beginning of 1940 more than 100 of the nearly 400 full-time qualified agents

attached to the associations in England and Wales at the outbreak of war were in the armed forces, and more than 60 others in some form of national service.

The annual meeting of the Central Council of the National Union of Conservative and Unionist Associations (the first meeting representative of the whole party organization since war came) took place on April 4, Lord Queenborough—who had held the office in 1928-29—being elected president in succession to the marquess of Londonderry. Its main business was the passing of an amendment to a resolution calling for national unity and emphasizing the need for not confining the political truce to by-elections, to the effect that the organization should not only abstain from provoking party feeling but should make known its appreciation of a similar attitude when adopted by other political parties. A further resolution condemning the activities of certain peace organizations that were alleged to create an atmosphere of defeatism was also adopted. This matter was reopened later in the month when Sir John Anderson, then honorary secretary, met the 1922 committee (which consists of the entire body of Conservative back-benchers) and told them of the measures being taken to deal with such societies and with the closer supervision of aliens.

The leader of the party since 1937 had been Neville Chamberlain and he remained as leader even after he had resigned from the premiership in May 1940, his successor as prime minister not wishing at that time to undertake the leadership of his party. In October the state of Mr. Chamberlain's health made it necessary for his resignation to be accepted, and Winston Churchill, after being elected unanimously, now became leader, since, as was in daily relation with the leaders of the other two parties, it would be more convenient if he could speak for the Conservatives with first-hand knowledge of their outlook on fundamental issues and with their authority. This action of Mr. Churchill's, though generally welcomed, was a disappointment to those of his supporters who had hoped he would hold himself aloof from party altogether, or even form a new one that could give the country something that was beyond the power of even the most enlightened conservatism to give.

Some concern was expressed by the 1922 committee over the power possessed by the chief whip, Captain David Margesson, and his assistants, and in October the prime minister received a deputation from it. This expressed the view that the chief whip had become more of a buffer than a channel between the party rank and file and the cabinet, and urged closer co-operation. Mr. Churchill, while in no way modifying his confidence in Captain Margesson, conceded the need of a closer liaison.

The earl of Clanwilliam, chairman of the Carlton club, was in April elected chairman of the Association of Conservative Clubs in succession to the late Lord Bayford.

Contests: *see* ADVERTISING; *Contests*; RADIO, INDUSTRIAL ASPECTS OF.

Contract Bridge. It was expected that 1940 was to be a very active year in contract bridge, but the spread of the war, quiescent in early 1940, prevented this. The drafting of the new code of laws, work on which had started late in 1939, came to a standstill. The Portland club of London, the Commission Française du Bridge of Paris and the Whist club of New York, under whose supervision the laws are promulgated, were in communication with each other for months regarding the new code. But when the war engaged the full attention of the French and the British, negotiations ceased, and Harold S. Vanderbilt, chairman of the Whist club committee, announced that nothing further would be done until such time as the foreign

committees would be able to co-operate.

This decision met with popular favour with the U.S. bridge players for two reasons: (1) it gave them another year, at least, of the old rules without the trouble of learning the new laws and adapting their games to them; and (2), being in full sympathy with their British and French brother players, they felt it only fair that the latter two groups be consulted before bringing out a new code. The committee announced no future date for the new laws; all it promised was that, as soon as Great Britain and France were able to start negotiating again, the three bodies would get together.

Contract bridge did its part, early in 1940, for the beleaguered nations. Huge bridge parties were held all over the United States to aid Britain, France and Finland. More than 30 ambulances were purchased and equipped in this manner and all surplus funds were used to relieve the suffering of the inhabitants in devastated areas.

The year 1940 brought out nothing new in respect to bidding systems. The Culbertson system, used by over 90% of the estimated 15,000,000 U.S. followers of the game, remained virtually the same. However, a new Culbertson system was promised the bridge players for the spring of 1941. Ely Culbertson was working on the new system and released a few of the contemplated changes.

The first change involves lowering the requirements for an opening bid. Mr. Culbertson believes that too many hands are passed out which should be opened. Many partial scores are missed due to the present high requirements for opening bids; by lowering the requirements a bit, he believes a more flexible group of bids can be introduced.

Another contemplated change is the definition of a biddable suit. At the present time the minimum requirement for a four-card biddable suit is Q-J-x-x (the x's denoting cards smaller than the ten). By scaling this down to Q-x-x-x or possibly J-10-x-x, Mr. Culbertson believes that opening bids will become easier to select, and more flexible in connection with the subsequent bidding. Naturally, if the requirements for a biddable suit are reduced, it will be necessary to raise the values for trump support of a once-bid suit. This will foster more one-over-one bidding, and, as a result, additional information will be exchanged between partners.

The American Contract Bridge league (1937 amalgamation of the American Bridge league and the United States Bridge association) reported larger attendance than ever before at its tournaments. A new high was reached in its two blue-ribbon events when 64 pairs of master players competed in the World Championship Master Pair event at Asbury Park, N.J., in August 1940, and 128 pairs competed for the National Pair championship at the winter tournament in Philadelphia, Pa. Over 300 sectional state and city championships were held throughout the United States, at which master points were awarded. The league in 1940 had 12,000 members, of which 3,000 were on the national master point list. Once again, the league's annual charity card party was held all over the country on St. Valentine's Day, and the proceeds were used for crippled and undernourished children. Upwards of \$30,000 was realized.

Tournament bridge laws, which come under the jurisdiction of the National Laws commission, were in the process of revision and the new code was promised for the summer of 1941. Many of the laws were undergoing minor changes, which should not affect tournament play. In the scoring, however, there was one major change contemplated which would affect the bidding habits of tournament players; there is a 50 point bonus for bidding and making a partial score, undoubled or doubled; under the new law, if a partial is doubled and the total is less than 100, the bonus

will be 100 instead of 50. If redoubled (a club or a diamond), the bonus will be 200. There was much dissension among the players as to the desirability of this change. The group against it contended that it would curtail "close" doubles and thus eliminate one of the exciting features of the game. The favouring group maintained that when the bonus for making a doubled contract was taken out of contract bridge, the game lost one of its most desirable elements.

The death list of 1940 included three well-known figures in the world of bridge. They were Mrs. Emory F. Clement, championship player; Walter F. Wyman, sportsman, lecturer and bridge writer; Cloyd F. Waltman, one of the first-string tournament directors of the American Contract Bridge league. (E. CUL.)

Cook, Frederick Albert (1865-1940), U.S. explorer, was born in Callicoon Depot, N.Y., June 10. He was graduated from the medical school of New York university in 1890 and was the surgeon of the Peary Arctic expedition in 1891-92 and of the Belgian Antarctic expedition in 1897-99. On Sept. 1, 1909, he reported to the Royal Observatory at Brussels that he had reached the north pole and had discovered "land far north" on April 21, 1908. He was welcomed with enthusiasm when he arrived at Copenhagen, but his account of his discovery did not satisfy all the experts. On Sept. 6, 1909, Commander Robert E. Peary reported from Indian Harbour, Labrador, that he had discovered the pole on April 6, 1909. Dr. Cook's evidence of his priority of discovery was submitted to the University of Copenhagen, which failed to find it satisfactory and Dr. Cook did not appear to challenge that decision. He then left the country and sank into obscurity. In 1923 he was convicted on a charge of using the mails to defraud and was sentenced to prison. He served five years of his term, was paroled in 1930 and pardoned by Pres. Roosevelt May 17, 1940. He died after a long illness in New Rochelle, N.Y., Aug. 5.

Coolidge, Dane (1873-1940), U.S. naturalist and novelist, was born in Natick, Mass., March 24, was graduated from Stanford university in 1898 and spent the next year in study at Harvard. While in college he spent his vacations as a field collector for Stanford, the British museum and the United States Biological survey. In 1900 he was a field collector of mammals in France and Italy for the United States Natural History museum. He published his first novel in 1910 and continued to write until his death. He died in San Francisco, Aug. 8.

Cooper, Courtney Ryley (1886-1940), U.S. author, was born in Kansas City, Mo., Oct. 31. He ran away from school at the age of 16 to become a circus clown. He began to write for newspapers in 1910 and a few years later wrote tales of the circus for magazines. He wrote more than 500 such stories and was the author of more than a score of books of adventure. He died in New York city, Sept. 29.

Co-operatives: see FARMERS' CO-OPERATIVES; MARKETING.

Copper. World production of copper in 1939 increased by 9% over 1938, to 2,161,500 metric tons, of which the United States produced 666,800 tons (31%) and the British empire 580,000 tons (27%). The United States output increased by 32%, and the Mexican by 18%, but other producers had either losses or increases below the average.

Smelter production in the United States in 1940 was estimated at 823,000 metric tons, an increase of 27% over 1939. The refinery output, which included recoveries from scrap, was 900,000 tons, up 19% from 1939. Deliveries to consumers at 953,000 tons were

U. S. S. R.	25.8	30.7	92.5	98.0	107.0
United States . . .	931.1	231.8	757.4	505.0	666.8
World Total . . .	1,921.6	905.5	2,271.6	1,984.1	2,161.5
Ex. U. S.	990.5	673.7	1,514.2	1,479.1	1,494.7

6% above output, and 11% above deliveries during 1939. During the first half of the year sales lagged behind production, and stocks increased 35%, but this was more than offset in the second half, the year ending with stocks 10% less than at the beginning.

The total copper imports into the United States in the first 11 months of 1940 were 678,118,000lb., of which 532,890,000lb. were for processing and export, and 145,228,000lb. were for domestic consumption; this compares with 463,018,000lb., 431,639,000lb. and 31,380,000lb. respectively for the whole of 1939. Exports of crude and semifinished copper, including bare wire but not insulated wire, were 776,637,000lb. in the first 11 months, against 840,307,000lb. in the whole of 1939.

Chilean production during the first three quarters of 1940 was 13% ahead of the same period in 1939. During the first quarter Rhodesia was 14% ahead of the 1939 average, rising to 37% in May. The total for the first seven months in Mexico was 20% behind the same period of 1939. Later figures for these producers did not appear, and for others no information was at hand, practically all of them having discontinued the publication of statistics for the duration of the war.

There was little improvement in the German copper position through its conquests in 1940, for while about 170,000 tons of additional smelting capacity was acquired in Belgium, France and Norway, this was largely dependent on imported ores, so that the only relief to the German shortage was that derived from such stocks of ore and metal that were on hand at the time of seizure. (See also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION; STRATEGIC MINERAL SUPPLIES.) (G. A. RO.)

Copra: see COCO-NUTS.

Copyright. During the year 1940 the copyright law of the United States (Act of March 4, 1909) was amended in various important respects. By Public act No. 434, approved March 15, 1940, the words "when such contribution has been separately registered" were deleted from section 23 of the Copyright act. The effect of this amendment is to permit renewals by authors or their widows, children, executors, etc., of works originally published as contributions to periodicals or other composite works.

Other bills for general revision of the copyright law were introduced in congress in 1941. Thus far, however, the conflict of interests involved and the exigency of other matters have succeeded in postponing the adoption of an entirely new law and confined the changes to amendment of the existing statute.

With the transfer of jurisdiction over prints and labels from the commissioner of patents to the register of copyrights on July 1, 1940, by the act of July 31, 1939, the copyright office has in its charge all copyright business. During the fiscal year ending June 30, 1940, 176,997 registrations of claims of copyright were made in the copyright office. The total fees received amounted to \$304,005.00.

The copyright law in force requires, as one of the conditions precedent to the registration of a claim of copyright in any work the deposit of two copies of U.S. books and one copy of foreign books. The purpose of this provision is to secure copies of the best edition of a work for the enrichment of the library of Congress. The number of books and other articles deposited in connection with registrations made during the fiscal year amounted 272,041, of which number 171,738 were transferred to the library of Congress. These included 77,814 books, 69,579 periodical numbers, 19,759 pieces of music, 3,053 maps and 1,533 photographs and engravings.

(C. L. B.)

Cordier, Constant

(1880-1940), retired U.S. army officer, was born in New Orleans, La., May 3. He was educated at Harvard and the University of Lima, Peru. He served as an officer in the regular United States army from 1900 to 1919, during which time he was engaged in organization and administration and missions abroad. He advised Peru in its boundary dispute with Bolivia and Ecuador and was for a time political adviser to the U.S. legation at Quito, Ecuador. Congress thanked him for his diplomatic work in South America. During the World War of 1914-18 he assisted in the organization of the American expeditionary force and was then liaison officer for the war department and the foreign missions in Washington. He received the Distinguished Service medal. France made him a member of the Legion of Honour and he was decorated by Great Britain, Japan, China and Italy. He died in Mineola, N.Y., Feb. 21.

Corn (MAIZE). The United States corn crop of 1940 was estimated by the department of agriculture Dec. 1 as 2,449,200,000bu., about 6% less than the 1939 crop of 2,602,133,000bu., and 10% over the ten-year (1929-38) average of 2,299,342,000bu. Stocks of old corn on farms Oct. 1 were 555,135,000bu., a supply that has been exceeded but once on that date, 555,596,000bu. Oct. 1, 1939. The ten-year (1929-38) average carry-over Oct. 1 was 193,967,000bu. It was estimated that 430,000,000bu. of the 1940 crop were sealed under government loans Oct. 1. On the same date in 1939 corn sealed under federal loans was 254,000,000bu. to which 301,000,000bu. of the 1939 crop were subsequently added. Government loans in 1939 were at 57 cents per bu. Owing to higher prices for corn in 1940 the amount advanced by the government was raised to 61 cents per bu.

The yield per acre in 1940 was 28.3bu. compared to 29.4bu. per acre in 1939 and a ten-year average of 23.2bu. In the 12 states constituting the corn belt 25,000,000 of the 49,544,000ac. planted to corn in 1940 were in the new, higher-yielding, drought-resistant hybrid varieties, the Federal Agricultural Marketing service re-

Corn Production by States in 1940 and 1939

(See also CEREALS.)

ported. The marketing service's survey reported that 88% of the 1940 Iowa corn crop was in hybrid varieties; in Illinois 77%, Indiana 66%, Ohio 57%, Minnesota 54%, Wisconsin 51%, Missouri 28%, Nebraska 23%, Michigan 17%, South Dakota 12%, Kansas 8%, North Dakota 3%.

Reports of foreign production of corn were fragmentary because of wartime restrictions on agricultural statistics. The corn crop harvested in Argentina in 1940 (1939-40 crop year) was reported as 408,442,000bu. compared to 191,485,000bu. in 1939. In a decree of Aug. 14, 1940, the Argentine government offered 36 cents a bushel to growers for corn for export up to Nov. 30. The South African crop harvested in 1940 was estimated at 72,277,000bu. of which 8,534,000bu. were grown by natives. The 1940 crop in Hungary was reported as 116,686,000bu. compared with 91,906,000bu. in 1939. (S. O. R.)

Cornell University. A non-sectarian, co-educational institution in Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law and medicine (located in New York and operated in conjunction with the New York hospital), and the state-supported colleges of agriculture, home economics and veterinary medicine. Two experiment stations, at Geneva and Farmingdale, are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school. During the academic year 1939-40, there were 7,174 students, of whom 1,552 were women. The faculty, which had 1,689 members, included 52 emeritus professors, 310 professors, 38 associate professors, 265 assistant professors, 32 lecturers and associates, 443 instructors and 549 assistants. A significant appointment during the year was that of Dr. Peter Debye, former George Fisher Baker non-resident lecturer in chemistry, as professor of chemistry and chairman of the department of chemistry. Productive funds on June 30, 1940, amounted to \$31,015,017. Land and buildings were valued at \$19,654,425 and equipment at \$8,402,189. The library contained 1,071,844 volumes. President, Edmund Ezra Day, Ph.D., LL.D. (E. E. D.)

Corporation Income Tax: see INCOME TAX.

Cortelyou, George Bruce (1862-1940), U.S. statesman and industrialist, was born in New York city, July 26, and was graduated from the Georgetown university law school in 1895. He was stenographer and executive clerk under President Cleveland and secretary to Presidents McKinley and Theodore Roosevelt. In 1903 President Roosevelt appointed him to the cabinet as secretary of commerce and labour. Later he was postmaster general and secretary of the treasury.

He was chairman of the Republican National committee from 1904 to 1907. On his retirement from the cabinet in 1909 he was elected president of the Consolidated Gas Company of New York, a position he held until his retirement in 1935. He died at Huntington Bay, N.Y., Oct. 23.

Corundum. The United States has no production of corundum, the natural oxide of aluminium, and depends entirely on imports, which vary from 2,000 to 4,000 long tons annually, mainly from South Africa. Extensive deposits are known in the Zoutpansberg, Pietersburg, and Leydsdorp district of Northern Transvaal and these now furnish the bulk of the world supply; the 1939 sales were 2,620 short tons, increasing to 2,039 tons in the first half of 1940. Costa Rica, a Central American republic; language, Spanish; capital, San José (pop. 66,800); president, Rafael Angel Calderón Guardia; area, 23,000 sq.mi. The population is 639,197 (Dec. 31, 1939 official estimate).

On Feb. 11, 1940, Rafael Angel Calderón Guardia was elected president to succeed Dr. León Cortés, and assumed office on May 10. Under Pres. Calderón Guardia, Costa Rica continued to maintain exceedingly cordial relations with the United States and to co-operate closely with western hemisphere defence measures. Popular support of the government's foreign policy was indicated in June by strong demonstrations of protest against Italian entry into the European war. A vigorous stand was taken against "fifth column" agitation, and the government summarily rejected the German minister's efforts to dissuade Costa Rica and other Central American states from participation in the Havana conference.

Economically, Costa Rica was hard hit by European war conditions, especially through loss of European markets for her coffee, but continued banana development in the Parrita-Quepos region, involving an annual influx of over \$3,000,000 new capital, helped to modify the economic crisis. The new plantations were declared to be the most scientifically prepared in the world. The precarious state of the coffee industry, Costa Rica's economic mainstay, was somewhat improved by the Inter-American Coffee Quota agreement of Nov. 1940, which allotted Costa Rica 200,000 bags (60-kg. each) for export to the United States against 104,036 bags in 1936.

Most significant of all the year's events was beginning of work on the 360-mi. section of the Pan American highway from San José to the Panama border under supervision of United States Public Roads administration experts. The project, financed by a \$4,600,000 United States Export and Import bank credit, was regarded as a valuable offset to unemployment, as well as an eventually important factor in the national communications system. Costa Rica has extensive external communication by sea and by Pan American Airways. Several domestic air lines, 450mi. of railway, and an 1,800mi. highway system provide internal communication.

In 1939, imports (chiefly foodstuffs and manufactured goods) totalled \$16,884,962 (United States, 58.8%; Germany, 17.7%), including \$3,873,475 for banana development; exports were \$9,086,498 (United States, 45.6%; Germany, 25.1%; Great Britain, 16.9%). Coffee (51.1%), bananas (21%) and cacao (8.2%) are the most important exports.

Costa Rica, cultural centre of Central America, has 671 public schools (64,594 pupils). A national university was established in Aug. 1940. The monetary unit is the colon (value: 17½ cents U.S.). (L. W. BE.; L. C. DE A.)

Cost of Living. The upward trend of the cost of living characteristic of almost the entire world after 1933 continued into 1937-38, but only in France and Norway (excluding war areas) did 1937-38 indexes of food prices go higher than in 1929. In most nations 1937-38 food prices were higher than 1936 and higher again in 1939. The outbreak of the European war was stimulating the upward movement of prices during the last half of 1939. Great Britain, Finland, Belgium, Norway and Switzerland experienced almost a 10% increase in food prices in 1937-38 but during the first half of 1938 cost of living stabilized at approximately the 1937 levels in most of the nations. In 1939 there was a slight increase during the early part of the year and a more substantial upward movement during the late summer and fall. Early 1940 figures showed slight increases.

*Table from *International Labour Review*, July 1938 (p. 140), Oct. 1939 (p. 567) and July 1940 (p. 78). Quarterly averages for 1937 computed in February, May, August and November. Australian and French figures are for February, May, August and November instead of months listed in the table.

The cost of living reached a very high level in Great Britain early in 1940. In January alone, food costs rose 2½% in spite of the efforts of the government, which was spending £1,000,000 a week in pegging down the prices of such staples as bread, flour, meat and milk. The indexes for Norway and Sweden also revealed extremely rapid upward movement of the cost of living in early 1940. In Germany, government control of prices explains the relatively small increase. For Italy, figures were not available. The United States cost of living rose less than 5% during the first year of the war which began in 1939.

The accompanying table shows the relative trends of cost of living in 11 countries from 1929 through May 1940. The figures have been recalculated by the International Labour office on a 1929 base and this table cannot be compared directly with the table published for 1937 and previous years. (See also FINANCIAL REVIEW; PRICES; WEALTH AND INCOME, DISTRIBUTION OF.)

BIBLIOGRAPHY.—Readers interested in additional information are referred to current issues of the *Monthly Labor Review* (U.S. bureau of labour statistics), the *Ministry of Labour Gazette* (British ministry of labour), and *The Labour Gazette* (department of labour, Canada). Cotton. World production of cotton in the 1940-41 crop year was estimated by the office of foreign agricultural relations, U.S. department of agriculture, as 30,500,000 bales of 478lb. net to the bale. Production in 1939-40 was placed at 28,900,000 bales; 29,200,000 bales in 1938-39. Owing to the absence of official reports in a number of countries, because of the war, the office of foreign agricultural relations placed its production estimates in three divisions: (1) estimates based on official reports or other credible information; (2) estimates based on acreage, reported growing conditions and crop records; (3) estimates based on production in recent years. These estimates on production in bales of 478lb. net are shown in Table I.

Production of cotton in the United States in 1940 (1940-41 crop year) was estimated by the department of agriculture at 12,686,000 bales of 500lb. gross, as of Dec. 1. Production in 1939 (1939-40 crop year) was 11,817,000 bales, and in the ten-year (1929-38) average, 13,547,000 bales. Yield of lint cotton in 1940 was 252.4lb. per acre. In 1939 it was 237.9lb. per acre. The ten-year average was 198.1lb. per acre. The area harvested in 1940 was estimated at 24,078,000ac. compared with 23,805,000 ac. in 1939. Estimated production by states is shown in Table II.

Consumption of cotton in the United States during the crop year ending July 31, 1940, was 7,745,574 bales. Domestic consumption during the year Aug. 1, 1940, to July 31, 1941, is ex-

pected to run more than 8,000,000 bales, the highest on record. Activity of cotton mills in the United States increased greatly during 1940. Cotton ginning Aug. 1, 1939, to July 31, 1940, were 11,376,233 bales. Stock of cotton on hand in the United States at the end of the crop year July 31, 1940, totalled 10,595,720 bales compared with 13,032,513 bales July 31, 1939. Data on world supplies are fragmentary because wartime regulations prohibit giving of cotton statistics in a number of European countries. Up to Oct. 1 the Federal Commodity Credit corporation reported loans of \$40,908,466 on 84-

439 bales of the 1940 crop. Of this amount \$5,699,597 was advanced on 117,595 bales by co-operatives. Trade reports anticipated that probably 4,500,000 bales of the 1940 crop would be stored under loans. The national marketing quota of cotton in 1940 was 12,000,000 bales, the same as in 1938 and 1939, and the same as proposed for 1941.

World trade in cotton during the year ending July 31, 1940, was substantially higher than the preceding year and only 9% below the average. Outstanding in the world movements of cotton during the year was the increase of United States shipments to the

Italy	577,000	292,000			

*Includes shipments to free port of Bremen.

United Kingdom, United States cotton being 31% of the imports by the United Kingdom, while Japanese imports of United States cotton were 28% below the ten-year average. United States shipments to the United Kingdom were the highest of any year since 1927.

The principal cotton exports of the United States in the year ending July 31, 1940, and in the preceding 12 months were as shown in Table III.

The heavy increase in United States exports was attributed to three factors. One was the depleted foreign stocks of United States cotton. Another was the federal government's aid in exports. The third was the fear that shipping losses in the war would curtail shipments subsequently. Japan, which is one of the largest exporters of cotton goods, consumed 2,419,000 bales of cotton during the year ending June 30, 1940, compared with 2,516,000 bales in 1939. Much of Japan's market for cotton goods has been reduced, while its stocks have accumulated. As a result of smaller imports of cotton by Japan and a shift to Brazil as a source of supply the U.S. department of agriculture reported that Japan would probably take not more than 500,000 bales of U.S. cotton in 1940-41. The Japanese eight-year plan to increase cotton production in northern China from less than 500,000 bales to 3,000,000 bales annually made no "notable progress" in 1940 because of lack of funds, U.S. agricultural advices reported. Japan bought the entire 1940 cotton crop of Iraq. The British government took over the Egyptian crop and established a fixed price to growers. Effective Oct. 1, 1940, the British government announced a maximum price for American and Egyptian cotton based on Liverpool price levels as of Sept. 24. The same order provided that utilization of all nonempire cotton would be under licence.

Cotton pledged on U.S. government loans, from the 1940 crop, totalled about 2,553,000 bales through Dec. 19, 1940, bringing the total stocks of government-financed cotton to about 10,800,000 bales.

(S. O. R.)

Cotton Manufacture.—The national defence program was by

COTTON CROP in the United States. The figure for 1940 is the Department of Agriculture's December estimate

PLOWING a New Mexico cotton field in the spring of 1940

far the greatest influence in the United States cotton manufacturing industry in 1940. Although it can be shown statistically that government purchases added a relatively small percentage to the total quantity of cotton consumed during the year, there were indirect effects of far greater significance. In the first place, the defence program boosted the level of general industrial activity throughout the country and in practically all divisions of U.S. economy, with the result that the level of purchasing power was likewise raised. This, in turn, had its effect on textiles, just as such moves always influence a consumer-goods industry. In the second place, the pressure of army purchases upon certain groups of cotton textiles, in which a scarcity or potential scarcity existed, had an effect far beyond the poundage or yardage of the bids involved.

Some idea of the extent of the government operations can be gained from the list of partial purchases of cotton products by the quartermaster corps of the army between June 30 and Dec. 1, 1940.

Cloth, cotton herringbone twill, yd.	4,600,000
Cloth, cotton khaki, 8.2 oz., yd.	36,919,000
Coats, working, denim, yd.	2,874,000
Drawers, cotton, short, yd.	5,155,000
Duck tentage, cotton, o.d. light, yd.	3,450,000
Duck tentage, medium, yd.	6,547,000
Duck tentage, heavy, yd.	19,396,000
Handkerchiefs	5,005,000
Shirts, cotton khaki	926,000
Sheets	7,380,000
Socks, cotton, pr.	14,000,000
Towels, hand, huck	5,200,000
Towels, bath	1,500,000
Trousers, cotton khaki	1,300,000
Trousers, work, denim	2,800,000
Undershirts, summer	4,200,000

The principal bottlenecks in cotton textiles, so far as the defence program was concerned, were in heavy cotton goods, because of the tremendous demand for duck, and in combed yarn cotton goods, because of the specification of a combed yarn fabric by the army for shorts and for cotton khaki uniforms. At times, offerings on invitations to bid were below the specified quantities, and it was necessary to modify specifications to draw out sufficient bids.

The Fall Boom.—Due to both the direct and indirect influences of the defence program, as noted above, the fall of 1940 was the most active one in cotton manufacture in the history of the industry. The calendar year 1940 as a whole closed with a domestic consumption of approximately 8,000,000 bales, a new high. This was approximately 8% greater than the consumption of the previous year which had been a record. Since, as just mentioned, the height of the activity was reached in the fall of 1940, and since it was still going strong at the start of 1941, there are predictions of a total domestic consumption of 8,500,000 bales or even 8,750,000 bales for the crop year which ends July 31, 1941. Brilliant as this statistical picture may seem, the thoughtful student sees in it no assurance of a permanent solution of the cotton problem. Consumption has not increased as the result of a broad awakening of cotton consciousness, but rather because of a combination of national and international developments which acted as artificial stimuli. The reaction from them will eventually take place and there will be the same problem of a burdensome cotton surplus and continued inroads from competitive fibres, particularly the synthetics.

The Synthetics.—On the matter of synthetic competition, there is no question that the defence demands delayed the march into the territory of cotton. There was immediately a considerable demand for cloths made of cotton. Nevertheless, there is no reason to believe that the advance of synthetics at the expense of cotton has been halted at all permanently. The advantage was in 1940 still definitely with the man-made fibre, because of its controllability both as to characteristics and quantity. The possibility of a completely synthetic industry some time in the future could not be discarded as a crazy notion.

That, of course, is from the standpoint of the supply, which threatened cotton agriculture more than it did the cotton industry. In fact, some of the developments in connection with synthetic fibres held promise of an increase rather than a decrease in the function of the cotton mill. Cotton manufacturers were turning more and more to equipment designed specifically for handling of spun rayon—either alone or blended with wool fibres—and were producing from such yarns outerwear fabrics for men's and women's summer wear which previously had been made in woollen and worsted mills. The advantage the cotton mill has in this respect is, generally speaking, greater speed of production.

The tendency toward ever-increasing speeds of operation was further evidenced by such developments as extension of the installations of long-draft roving, and the perfection of automatic winding. The cotton mill is constantly becoming more and more completely automatic.

Wage-Hour Legislation.—The operation of the wage-hour law, which was cotton-textile issue No. 1 in 1939 up to the outbreak of the war in Europe, was relegated to a position of almost negligible importance in 1940, principally because of the dominance of the needs of the defence program. The minimum wage of 32½ cents adopted by an industry committee and made effective Oct. 24, 1939, was still in force. Constitutionality of the wage-hour law had been attacked by a group of southern cotton mills and the decision on their suit was pending before the United States supreme court at the close of 1940.

In other respects, also, the field of employer-employee relations in the cotton textile industry was quiet. Strikes were few in number and the main problem was one of securing an ample supply of help, particularly in the more skilled classifications, to meet the needs of the defence program. The tendency toward sale of mill houses by the company to employees in the southern industry continued but did not yet develop into a major trend.

Anti-Trust Action.—A case which held in its implications the question of what an over-competitive industry such as cotton tex-

tiles can do to put its house in order was the suit brought by the federal bureau of investigation against a committee representing the print cloth branch of the cotton textile industry. This committee had undertaken a joint voluntary program, on the part of the members of the industry, toward the reduction of operations in the summer of 1939, prior to the stimulating effect of the war in Europe. The committee had discussed its intent and its method publicly. The case finally came to trial in Greenville S.C., toward the end of 1940. The defendants entered pleas of *nolo contendere*, thus admitting no violation of the anti-trust statutes, but at the same time preventing delays in the national defence program which would have resulted from prolonged trials. They were given nominal fines of \$100 each, and the presiding federal judge stated that the payment was not in any way a penalty but simply intended to meet the technicalities of the law. He stated that if he were sitting on a jury, he would declare the defendants innocent of any violation of the law in the case. It is recognized that the answer to this question of industry-wide co-operation, and its relation to the anti-trust statutes, has still not been given.

Cotton Promotion.—An important step taken by the industry in 1940 was a launching of a still more aggressive cotton promotion program. The Cotton-Textile institute, with the co-operation of other groups, proposed to develop what was called a Cotton Bureau of America, for the purpose of trying to increase domestic cotton consumption to 10,000,000 bales a year. It secured pledge of special assessments of two cents per bale of cotton consumed from more than half of the spindles in the industry and also enlisted the co-operation of all groups engaged in cotton economy from the grower through to the retail distributor. One of the important factors in this movement is the co-operation of some 100,000 retail stores, large and small, chain and independent. Craigavon, James Craig, 1ST VISCOUNT (1871-1940), prime minister of Northern Ireland, was born in Craigavon, County Down, Ireland, Jan. 8, 1871, and died at Glenraig near Belfast, Nov. 24, 1940. For a biographical sketch see *Encyclopædia Britannica*, vol. 6, p. 630.

Cramer, Stuart Warren (1868-1940), U.S. manufacturer, was born in Thomasville, N.C., March 31, and was graduated from the United States Naval Academy in 1888. In that year he entered the school of mines of Columbia university. In 1889 he was employed as an assayer in charge of the U.S. assay office in Charlotte, N.C., remaining there until 1893, when he was employed as manager of a mill. From 1895 to 1918, as a mill engineer and contractor, he designed or equipped about one-third of the cotton mills in the south. He served as president or treasurer of several cotton mills. During the World War of 1914-18 he was a member of the production engineering committee of the U.S. council for national defence and served on several other commissions, including President Hoover's commission on relief for the unemployed and the commission on home ownership. He died in Charlotte, N.C., July 2, 1940.

Cravath, Paul Drennan (1861-1940), U.S. corporation lawyer, was born in Berlin Heights, Ohio, July 14. He was graduated from Oberlin college in 1882 and from the law school of Columbia university in 1886. He

was first employed by the law firm of which Charles Evans Hughes was a member, and at the same time was a law tutor in the Columbia law school. During the World War of 1914-18 he was counsel to the Col. House commission to the inter-Allied war conference, and in 1918 he was made counsel of the U.S. mission to the inter-Allied council on war purchases and finance. Because of his services with these commissions Gen. Pershing gave him the Distinguished Service medal; he was also made a Chevalier of the French Legion of Honour, a Grand Officer of the Italian Order of the Crown, an honorary bencher of Gray's Inn, London, and an officer of the Crown of Rumania. He died at Locust Valley, L.I., N.Y., July 1.

Crawshaw, William Henry (1861-1940), U.S. educator, was born in Newburgh, N.Y., Nov. 6 and was graduated from Colgate university in 1887. He was then appointed an instructor in English and elocution at Colgate. In 1893 he was made professor of English literature and in 1917 professor of general literature, holding that post until his retirement in 1930. He was dean for 33 years until his retirement, and acting president of the university three times. He was the author of several books, including *The Interpretation of Literature*, *The Making of English Literature* and *The Indispensable Soul*. He died in Hamilton, N.Y., July 2.

Cricket. The war put the shutters up against county cricket for the summer of 1940. The game was barely kept alive in the first-class sense, the most ambitious effort being that of a miscellaneous side calling themselves the "London Counties"—somewhat of a misnomer as players such as Arthur Wellard of Somerset turned out consistently. This team played week-end matches regularly, mostly one-day events, and were too strong for the majority of their opponents; perhaps the most interesting feature of their play was the return to this class of cricket of Jack Durston, the former fast bowler of Middlesex, who now met with considerable success as a bowler of slow leg-breaks. This one-day cricket demonstrated the adaptability of first-class players to the unaccustomed conditions; 600 runs in a day did not prove beyond the capacity of the competing teams, and players of promise were discovered; but, without any real standard by which to judge, it would be unwise to attach too much importance to their performance.

Many of the county professionals played Saturday afternoon cricket with the Bradford league. In this competition Eddie Paynter, playing for Keighley, and Wilf. Barber, for Brighouse, indulged in a duel for honours. Paynter won, scoring over 1,000 runs and finishing with a final average of 79 per innings, closely followed by Barber, who generally scored at a much faster pace than was usual with him in county games. George Pope, the younger of the two Derbyshire brothers, playing for Lidget Green, getting near the 1,000 runs and having over 100 wickets to his credit, set up all-round figures without parallel in the long history of the Bradford league.

In Australia a normal season's play was gone through, with an unusually exciting finish. When New South Wales and Victoria met in the last match of the season the situation was such that the championship depended upon it. New South Wales were eventually victorious, in what was to all intents and purposes a "final tie" match, despite the fact that Hassett, the Victorian batsman, scored a century in both innings. As further demonstrating the all-round strength of New South Wales—who recovered brilliantly from a bad start—the side met and defeated by two wickets a team made up of the rest of Australia, including Bradman, who was not quite the outstanding success of previous seasons. Stan McCabe, captain of New South Wales, was again

their premier batsman, but W. J. O'Reilly, with 52 wickets in Sheffield Shield games, exceeded his previous best in a season in that competition. Valuable assistance was rendered by another spin bowler, Pepper, who is mentioned as a likely successor to Clarence Grimmett, the googly man who, by the way, continued to get many victims.

It was noticeable that the Australian pitches in general, and the one at Sydney in particular, were of the kind to balance much more evenly the struggle between bat and ball, and there was brighter cricket all round. In Cohen, New South Wales had an opening batsman who might succeed some of the famous players who have occupied this role for Australia in the past. Cricket in South Africa was not distinguished either for outstanding performances or general quality of the play; it was restricted, also.

Crime. With the advent of 1940, the *Uniform Crime Reports*, initiated in 1930 as a means for securing comparable data on the volume and distribution of criminal acts, moved into their second decade. As the reporting area was extended, rapid growth of the crime reporting system naturally slackened. As of Jan. 1, 1940, it included 94.1% of all cities and towns in the United States with over 10,000 population, and 98.3% of the total population of all communities of this character. A large number of smaller places and many extensive rural areas were also included. Using such representative sources as an index for the country as a whole, the federal bureau of investigation estimated that a total of 1,484,554 "reportable offences" (comprising the eight selected types of crimes listed below) were committed in the United States during 1939. This represented an increase of 3.6% over a similar estimate for 1938.

Crime in Cities, Towns and Villages.—During the 1930-39 decennium, all classes of reportable offences declined in number, except rape and larceny, which increased perceptibly. These depression years might be expected to increase the number of thefts, many of which were of a petty nature. Aggravated assaults and burglaries, however, showed a rising tendency towards the end of the ten-year period, and this apparent reversal of the trend was extended into 1940. The long, and at times precipitous, decline in auto thefts also came to a temporary halt during 1940. Thus there were surface indications that the urban portions of the United States might be about to experience a new wave of criminal acts, though the extent of the upswing was not significantly large in any of the affected offence categories.

A comparative statement of crime rates for the first nine months of the years 1938, 1939 and 1940 appears in Table I. It is based upon returns from 2,025 cities, towns and villages in 1940, from 1,964 such communities in 1939 and from 1,894 in 1938.

Table I.—Offences Known to the Police
January-September, 1938-40 Inclusive; Rates per 100,000 of Population

Offence	1940	1939	1938	Offence	1940	1939	1938
Murder and Non-negligent Manslaughter	4.0	4.0	3.9	Robbery	39.1	40.7	42.4
Manslaughter by Negligence	3.1	2.9	3.1	Aggravated Assault	34.8	34.3	32.8
Rape	6.8	6.8	6.3	Burglary—Breaking or Entering . . .	263.8	259.4	243.0
				Larceny—Theft . . .	690.3	652.1	584.9
				Auto Theft	129.0	128.8	134.8

There were no major changes in the geographic distribution of crime. The south Atlantic, east south central and Pacific states in general had the highest urban rates, with New England and the middle Atlantic region having the lowest. Homicides and assaults reached their highest levels in the south; auto theft and burglary were highest on the west coast.

Crimes tend to be relatively more frequent in the larger cities, with diminishing rates as cities dwindle in size. This general rule again prevailed in 1940, except that Group II cities (with

AFTER THE FATAL BOMBING of July 4, 1940 at the New York World's fair, 675 detectives of New York city attended a special course to prevent repetition of such outrages. In the picture Police Commissioner Lewis J. Valentine is addressing the class

populations from 100,000 to 250,000) dislodged the largest cities from their leading position in 1939. Even this shift, however, was in accordance with rule, because the two groups often thus exchange their relative positions.

The percentage distribution of reportable offences during 1940 showed larceny with 58.9% of the total, burglary 22.5%, auto theft 11%, robbery 3.3%. As compared with 1938 and 1939, these figures showed an increase for larceny, but relative declines for the others. As in 1939, so again in 1940, crimes against the person represented only 4.3% of all reportable offences. In Table II the per capita rate for the several offences, during the first three quarters of 1940, is shown for 2,025 cities, towns and villages, grouped according to size, and with a total population (1933 estimate) of 62,288,351.

Table II.—Crime Rates per 100,000 Population
January-September, Inclusive, 1940

	Population Groups of Cities (000 Omitted)						Total
	I Over 250	II 100-250	III 50-100	IV 25-50	V 10-25	VI under 10	
Murder and Non-Negligent Manslaughter	4.0	4.4	3.9	2.9	3.0	3.6	4.0
Manslaughter by Negligence	4.0	3.2	2.7	2.6	1.4	1.8	3.1
Rape	8.6	5.2	4.8	4.0	5.4	6.2	6.8
Robbery	54.2	37.4	20.6	22.0	18.5	17.6	39.1
Aggravated Assault	37.4	11.2	45.4	20.0	23.0	21.2	34.8
Burglary—Breaking or Entering	296.5	305.1	274.0	243.0	196.0	193.3	263.8
Larceny—Theft	700.4	777.5	724.0	719.3	507.0	424.1	690.3
Auto Theft	149.5	151.7	118.5	116.0	83.7	77.2	120.0

The increasing frequency of larceny since 1930 has been marked chiefly by a relative increase in the smaller thefts, as reflected by figures for 1938-40, shown in Table III.

Table III.—Relative Frequency of Smaller Larcenies

Value of Property Stolen	Per Cent of Total Larcenies		
	1940	1939	1938
Over \$50.00	10.9	11.8	13.0
\$5.00 and under \$50.00	65.0	64.9	65.0
Under \$5.00	24.1	23.3	22.0

Although Table III shows the increasing relative frequency of the smaller larcenies, and a relative decline in the larger losses by theft, this fact should not be allowed to obscure the social

significance of the continuing rise in the larceny rate.

Coincident with the rise in the larceny rate was a slight decline in the per cent of stolen property recovered. During the first three quarters of 1940, only 66.5% was recovered, as compared with 67.2% in the corresponding period of 1939, the latter being a peak year. A further rise, however, was shown in recoveries of stolen cars. In 1940, recovered cars represented 97.8% of those stolen, as compared with 96.0% in 1939, and 93.5% in both 1938 and 1937.

With respect to larcenies in general, thefts from parked motor cars represented by far the largest single type, reaching the impressive figure of 36.5% of all larcenies reported. Bicycle thefts were 15.3% of the total. Police were unable to suggest any new means by which they could better protect from theft the hundreds of millions in property left unattended on city streets and rural highways.

Rural Crime.—The federal bureau of investigation made a special statistical study of rural crime rates for 1939 in seven selected states (California, Idaho, Massachusetts, Michigan, Minnesota, Rhode Island and Washington). It served to confirm the results of earlier fragmentary studies to the effect that while the rural rates for crimes against property quite generally are well below urban levels, the rural rates for homicide, rape and aggravated assault were quite likely to exceed those of the cities. In the states under review, this was particularly true of California, Idaho and Washington, and was least pronounced in Rhode Island and Michigan. As to negligent manslaughter (traffic accidents) and rape, the rural rate exceeded the urban in five of the seven states.

(See also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; POLICE.)

(Br. S.)

Great Britain.—Statistics for 1938, the latest year for which they are complete and available, show a slight decrease in the total number of persons found guilty of offences of all kinds, the number having fallen from 805,336 in 1937 to 787,482. Of this total no less than 475,124 (rather over 60%) were found guilty of offences against the traffic laws and under 10% in respect of indictable offences (actual crimes—the large majority in the

PORTABLE RADIO for patrolmen devised for Atlantic City police in 1940. It is worn on the belt with an aerial wire thrown back over the shoulders. Power is supplied by a flashlight battery

A SMALL SPOT LIGHT, attached to the barrel of a revolver, was devised in 1940 to help policemen hunt criminals in the dark. As demonstrated above, the light projects a small circle on the target that the bullets will strike. The beam has an effective range of approximately 50 feet

case being thefts), the remainder being nonindictable cases.

Of the offences against the traffic laws nearly 366,000 were in connection with cars and about 84,100 with pedal cycles; 29,400 persons were found guilty of careless or dangerous driving and 60,000 of obstruction.

Of the 78,463 persons found guilty of indictable offences half were under 21 years of age. Larcenies account for 56,092 convictions and cases of "breaking and entering" rose slightly to 10,814; in these two groups 35% of the former and 63% of the latter were in respect of persons under 17 years of age. Of all the indicted offenders less than 5% were convicted of sexual offences and personal violence; 87.5% of this group were males, the numbers per 10,000 of the total offenders of all kinds being 39 among the males and 5 among the females. Cases of fraud and false pretences numbered 2,749, of receiving stolen goods 2,584 and of violence against the person 1,583.

Of nonindictable cases drunkenness showed a small rise on the year to 52,661, but a large rise on the 1932 total of 33,100; betting and gaming convictions amounted to 18,504; offences against police regulations, by-laws and the licensing of cars, dogs, etc., totalled 68,772; nonindictable assaults 10,699; and offences against the liquor laws other than drunkenness 4,136.

Of all offenders found guilty only 3% received sentences of imprisonment or detention, 6% were bound over, 10% dismissed and cautioned and 81% fined.

It is satisfactory to note the steady decline in the reconviction rate is being maintained.

Murders during 1938, known to the police, numbered 84; in 30 cases the suspect committed suicide, and of those brought to trial 18 were sentenced to death (of whom 9 were hanged, the sentences of the others being commuted to penal servitude) and one ordered to be detained during his majesty's pleasure on the ground of insanity.

Suicides at 5,263 numbered 98 more than in 1937, but 8 less than the average for the five years 1933-37; 3,303 attempts were reported, 22 more than the recent average.

(L. H. D.)

Croatia: *see* MINORITIES; YUGOSLAVIA.

Crompton, Rookes Evelyn Bell (1845-1940), British engineer, was born May 31 and was educated at Harrow. At the age of 11 he was a naval cadet serving in the Crimean War and was decorated with a medal

with the Sevastopol clasp. From 1864 to 1876 he was in the rifle brigade and in 1900 he fought in the Boer War. In the meantime he had engaged in the electrical business and came to be known as the father of the electrical industry in Great Britain. He was made a Companion of the Bath in 1900 and in 1933 became a Fellow of the Royal society. During the World War of 1914-18 he was asked to inquire into the possibility of building "land ships" and as the result of his investigation the first tanks were constructed.

He was twice president of the Institute of Electrical Engineers. He was a delegate to the International Electro-Technical commission in the United States in 1926 which met to consider standardization of electrical equipment. He built a steam automobile and was the founder of the Royal Automobile club. He died in London, Feb. 15.

Crop Insurance. The number of United States wheat growers insuring their crops in 1940 increased 128% over 1939, which was the first year the Federal Crop Insurance corporation issued "all risk" insurance to wheat growers. In 1939 the number of insurance contracts issued was 166,000 to growers in 30 states. In 1940 the governmental corporation issued 379,500 contracts, under which farmers were guaranteed income from 106,477,000bu. of production on 11,300,000ac. in 33 states. This was an increase of 56% over the acreage insured in 1939. The larger percentage gain in the number of contracts, 128%, was because a larger number of small farmers took out policies in 1940. In 1940 the number of winter wheat growers who insured was 310,000, compared with 107,000 in 1939. Spring wheat growers to the number of 69,000 bought contracts in 1940, as against 59,000 in 1939. On the basis of its two years' experience, the Federal Crop Insurance corporation made revisions in rates and indemnities. Premiums equivalent to 14,807,000bu. of wheat were paid by growers in 1940. In 1939 growers paid insurance premiums equivalent to 6,769,120bu. of wheat.

Farmers may pay premiums either in wheat or in cash, although a large majority pay cash. Application for insurance must be made prior to seeding the acreage. The number of wheat crop insurance contracts issued by the federal corporation in 1940 in the principal wheat-growing states was as follows:

	No. of Contracts		No. of Contracts
Kansas	60,500	Indiana	28,300
Nebraska	57,240	Minnesota	21,000
North Dakota	31,600	South Dakota	21,000
Ohio	28,700	Illinois	14,800

Cruisers: *see* NAVIES OF THE WORLD.

Cryolite. The only known commercial deposit of cryolite in the world is at Ivigtut, Greenland; since this is Danish territory, the industry is closely linked to the trend of affairs in Europe. Shipments in 1938 dropped 15% from 1937 to 44,000 metric tons, 23,000 tons to Denmark and 21,000 tons to the United States; later figures are not available. In some years shipments were made direct to Canada, but in general the Canadian demand was supplied by re-export from the United States, while Denmark supplied the rest of the world. Imports received in the United States in 1940 increased heavily over 1939, but presumably exports to Denmark were discontinued. Since cryolite is a necessary ingredient in the electrolytic bath for the production of aluminium, countries producing this metal are the chief consumers of cryolite, with the U.S. heading the list. Cryolite is also used

CRYOLITE IS MINED only in Greenland. The picture shows a cryolite quarry where the mineral is extracted well below sea level. The industry was disrupted by Greenland's isolation after Germany seized Denmark in April 1940

in the manufacture of opaque glass and small amounts are used in enamels, glazes and insecticides. Some manufactured cryolite has been used in place of the natural product. (G. A. Ro.)

Cuba, a republic occupying the largest of the West Indian islands; language, Spanish; capital, Havana; president, Colonel Fulgencio Batista; area, 41,634 sq.mi. excluding small neighbouring islands. The population, 3,962,344 by the census of 1931, was unofficially estimated at 4,275,000 in Dec. 1940. Approximately 68% are whites. The chief cities (with 1930 populations) are: Havana, 542,522; Santiago, 103,525; Cienfuegos, 87,699. The United States has a leased naval base at strategic Guantánamo bay.

History.—Cuba is under constitutional government, with a regularly elected president and a bicameral congress, as provided by the constitution put into effect on Sept. 15, 1940. Politically, the outstanding events of the year 1940 centred about the deliberations and achievements of the constituent assembly elected in Nov. 1939 for the purpose of drawing up a new constitution for the republic, and about the election of a successor to President Federico Laredo Bru, whose term expired on Oct. 10.

The constituent assembly formally opened its sessions on Feb. 9, and under the presidency of Dr. Ramón Grau San Martín, former provisional president of the republic, proceeded to draft a new constitution. On June 8, the document, embodying some 318 articles, was officially adopted, and became effective Sept. 15. Politically, it provided for a semiparliamentary government with a quasi prime minister responsible to the congress and removable by it through a vote of lack of confidence. The lower house of congress was somewhat reduced in size, with one member for each 35,000 inhabitants instead of 25,000 as formerly, but the senate was enlarged from 36 to 54 members, nine for each province instead of six. Members of the lower house serve four years, half being elected each biennium; members of the upper house were

given six year terms, with a third of the membership elected each two years.

Several articles met with bitter opposition from business interests. Among the more outstanding of the ultraliberal social and labour provisions were the requirement of a month's paid vacation each year for workers; a 44-hour work week; unemployment accident and old age insurance; and government-fixed minimum wages. Restrictions on the amount of land which a corporation might hold were regarded as so vague that further interpretation would be required. The most bitterly contested feature of a was the transitory provision dealing with "liquidation" of the mortgage moratorium effective since 1934. Its cancellation of accrued interest and reduction of future interest, coupled with the long terms of amortization allowed, was subjected to attack on the grounds that it was semi-confiscatory and would impair Cuban credit abroad. A transitory clause empowering the government to grant monopolistic manufacturing privileges was subsequently suspended by congress (in October), pending further consideration of its effects. A further provision of the constitution barred from presidential candidacy anyone connected with the army within a year preceding the election, but specifically exempted Colonel Fulgencio Batista, who was at the time candidate for the presidency.

On July 14, accompanied by small but spectacular disorders, the election of a successor to President Laredo Bru was held. The election was preceded by a campaign of several months' duration, featured by political manipulation and log-rolling as Cuba's territorial political parties manoeuvred for political advantage. Seven parties endorsed the candidacy of Colonel Fulgencio Batista, one time army sergeant who had been regarded as Cuba's "Warwick" since 1933, when he became the dominant political figure of the nation. The other three parties gave their support to former provisional president Grau San Martín, regarded as definitely leftist. The actual campaign centred on personalities, however, rather than on issues or political philosophies, with groups ranging from extreme left to extreme right supporting each candidate. In the election itself, Colonel Batista won easily, although charges of fraud were freely made and formal investigation into alleged election irregularities was necessary before his election was finally certified. Legal battles over congressional and other election results were so common that the congress was unable to obtain a quorum on its constitutional date of assembly (Sept. 15). Some elections were undecided until late October.

On Oct. 10 the new president was inaugurated. Politically, his greatest problem was to provide adequate representation for the multifarious groups which had accorded him their support. For this reason, his cabinet included 14 members, 4 of them without portfolio. The new president was faced with difficult economic problems, especially financial, due to the unbalance caused by the European war and by efforts to protect the national credit. To this latter end extended efforts were made to obtain a \$50,000,000 credit from the United States Export and Import bank. Earlier, the congress authorized a bond issue to liquidate defaulted gold obligations approximating \$20,000,000 due to United States contractors for services during the Machado dictatorship.

The European war and its ramifications played little part in the presidential campaign, for both candidates were staunch advocates of hemisphere solidarity. Anti-democratic minority groups were active, however, during the year. On July 24, immediately after the presidential elections, the Falange Española, a pro-fascist organization closely linked with fascist Spain, was legalized. During the Spanish civil war it had been outlawed to preclude disorder and controversy between it and partisans of republican Spain, but it was given legal recognition after it had

amended its internal organization to conform to Cuban constitutional requirements. Vigorous public disapproval was manifested toward this act, which was regarded as "appeasement." In September, another pro-totalitarian group, the Cuban nazi party, was dissolved by order of the governor of Havana province. Cuban sympathy continued to be predominantly in favour of Great Britain in the struggle against Hitler and in November it was formally advocated in Congress that a gift of 300,000 bags of sugar be made to British civilians.

Administration policy under both President Laredo Bru and President Batista was to give practically unqualified support to the United States. In July Cuba was host to the Inter-American conference held at Havana. Subsequently the government facilitated development of defences. Following the lead of the United States, compulsory military service was authorized and extensive increases in the air force approved.

Education.—Total enrolment in primary schools was 423,420 for the 1937-38 school year. Schoolhouses devoted to primary education numbered 4,115, with more than 8,300 classrooms.

Army and Navy.—Cuba has an army numbering 15,000 men and officers, supplemented by a rural guard of 6,000. In Sept. 1940, compulsory military service for all males between 18 and 35 was required by law. The navy includes 16 small ships. Both army and navy have air services. In Aug. 1940, a new aviation school to train 800 pilots a year for the army air reserve was established.

Trade and Communication.—Cuba has numerous good ports, the most important being Havana and Santiago. Regular, frequent, external steamer communication is maintained, with daily service from Key West, Fla. Havana is on the main route of the Pan American airways. In 1939 international air traffic through the country increased more than 20% over 1938. The entire country enjoys excellent internal as well as external air transport facilities. Land communication is by a railway system (3,850mi., including 250mi. electric), based on an east-west trunk line, and by a network of 2,500mi. of improved highways, principal of which is the 706mi. Central highway from Havana to Santiago. Telephone and telegraph facilities, with 52,740 telephones and 10,939mi. of telegraph lines in 1939, are superior to those of any other western hemisphere country except the United States and Canada. Cuba has 54 radio broadcasting stations.

In 1939, imports totalled \$105,862,000, exports \$147,676,000, substantially the same as in 1938, with the United States supplying 74.1% of imports and taking 75.3% of exports. Great Britain, with 12.2%, was second best customer. Sugar and sugar products comprised over 76% of all exports in 1939; tobacco accounted for nearly 8%. In the first 9½ months of 1940, however, sugar tonnage exported was 19% less than in 1939. In the first full year of European war sugar exports were 25% less than in the preceding year, while stocks on hand were increased by substantially the amount of lost exports. Accompanying this was a lower sugar price than in the previous period. Total imports in the first 9 months of 1940 were 5½% greater than in 1939, but export values declined nearly 10%, with a steady monthly decrease after sugar-grinding season closed in 1940. Tobacco exports in the first 9 months of the year declined 10%. The United States took 86.7% of Cuban tobacco exports. Export of fresh fruits (avocados, grapefruit, pineapples and papayas) advanced sharply, while volume of fresh vegetable exports (largely tomatoes) increased over 50%. The sugar and tobacco export losses were ascribed primarily to trade disruption caused by the European war. In 1939, tourist trade declined, with 135,635 tourists (14% less than in 1938) entering the country. A slight recovery was made in 1940.

Finances and Banking.—The monetary unit is the peso, theo-

FULGENCIO BATISTA (right) taking the oath of office as president of Cuba Oct. 10, 1940, at the Presidential palace in Havana

retically equivalent in value to the U.S. dollar, but actually valued in international exchange during 1940 at 88 cents to 93 cents (Dec. 1940 value: 90½ cents U.S.). In 1939, net ordinary revenues were 69,079,000 pesos, actual expenditures approximately 82,000,000 pesos. The 1940 budget presumed 76,000,000 pesos revenue, 75,985,000 expenditures. Actual receipts exceeded estimates, but heavy supplementary credits more than offset, and the year's deficit was expected to be 5,459,000 pesos. The 1941 budget was fixed at 83,986,959 pesos. As of Jan. 31, 1940, the public debt was \$135,905,000, exclusive of a floating debt in excess of \$50,000,000. In Sept. 1940, congress authorized a loan of \$50,000,000.

Agriculture and Other Production.—Cuba is primarily agricultural, with sugar, above all, and tobacco the main crops. Set government policy, however, is to encourage crop diversification. World overproduction of sugar has resulted in crop and export restriction by international agreement, under which Cuba is given an export quota of 3,042,011 long tons, of which 1,693,647 long tons may enter the United States. Actual production in 1939 was 2,720,127 long tons, against 5,156,278 in 1929.

Tobacco, the second crop, was faced in 1940 with a chaotic world market condition as a result of the European war, and efforts were made to have all tobacco planting for 1941 proscribed by legislative action, with government compensation to growers. Coffee is increasing in importance, but production is relatively small. Under the Nov. 1940 Inter-American Coffee Quota agreement, Cuba was given a quota of 80,000 bags (of 60kg. each) for export to the United States. Total exports in the first 9 months of 1940 were 81,672 bags.

Cuba has valuable but undeveloped iron, oil, gold and other mineral resources. Total exports of mineral products in 1939 were valued at 4,621,000 pesos.

Manufacturing, except processing of agricultural products, is entirely for domestic consumption, and on the whole quite small. Plans for the erection of Cuba's first automobile tire factory were announced late in 1940. With a daily production of 200 tires, the factory will care for two-thirds of the country's requirements. (See also WEST INDIES.) (L. W. BE.; L. C. DE A.)

Curaçao, a Netherlands colony in the West Indies, comprising the islands of Curaçao, Aruba and Bonaire in the Leeward group, off the coast of Venezuela, and Saba, St. Eustatius and the southern part of St. Martins in the Windwards;

language, officially Dutch; capital, Willemstad (on Curaçao), pop. 30,453; governor, G. J. J. Wouters. The area of the colony is 436 sq.mi. (Curaçao, 210 sq.mi.; Bonaire, 95 sq.mi.; Aruba, 69 sq.mi.). The population (Dec. 31, 1938 official est.) was 101,021 (Curaçao, 62,798; Aruba, 28,155). The colony is administered by an appointed governor and a council, of whom a majority is elected.

History.—German invasion of the Netherlands in May 1940 had sharp repercussions in Curaçao. To protect the colony's oil refining industry, French and Canadian troops were landed, although the former were later withdrawn. Under war conditions, output of the refineries was considerably curtailed, with adverse effects upon employment and upon business. The colony benefited, however, from the transfer of the Royal Dutch Shell Co.'s home office to Willemstad and from the arrival of numerous refugees who took up residence. Unquestioned loyalty to the Netherlands government in exile was maintained, and proposals made at the Havana conference in July (see HISPANIC AMERICA AND THE EUROPEAN WAR) that a Pan-American trusteeship be established over European colonies in America met with sharp disapproval.

Communication.—External and inter-island communication is by steamer, with adequate air service from Curaçao and Aruba. In 1938 an average of over 41 ships cleared daily from ports of the colony.

Industry.—Refining of crude oil, chiefly of Venezuelan origin, on Curaçao and Aruba, dominates the colony's economy, and petroleum, with its derivatives, represents 99% of export values. Total exports in 1938 were 340,545,295 guilders; imports, over 90% crude oil, totalled 391,130,826 guilders. Around 75% of imports (entirely crude oil) normally comes from Venezuela, with miscellaneous imports supplied by the Netherlands and the United States. Under war conditions, the latter became the principal source of general imports in 1940.

Education.—The colony had 49 schools with 11,044 pupils in 1938. Three-fourths of the population is Roman Catholic.

Finance.—The monetary unit is the Netherlands East Indies guilder (since May 1940), valued at approximately 53.5 cents U.S. (See also WEST INDIES.) (L. W. BE.)

Curling. The Gordon International medal, the leading trophy in this old Scottish game, went back to Canada in 1940 for the first time since 1938 when the Royal Caledonia Curling club won it in Montreal. Sixteen rinks from the United States and an equal number from Canada competed.

The Douglas medal for the Canadian-United States invitation bonspiel, held at St. Andrew's Golf club, was won by the Schenectady Curling club's rink A, after a thrilling three-day tourney. The Royal Montreal team also took the Munson shield from Utica, N.Y., where it had been since 1932. The Saranac Lake Curling Club won the Patterson medal during the three-day bonspiel at Utica, and the Utica Curling club won the Mitchell medal. The Lake Mahopac club won the Allen medal. (J. B. P.)

Currency: see EXCHANGE CONTROL AND EXCHANGE RATES.

Cycling. For the first time in a number of years there was no six-day bicycle race held in New York. The reason was that most of the foreign riders, who in the past added so much colour to the endurance race, were kept at home by the war.

At the same time no world championships in cycling were contested in 1940 for the same reason. Therefore, the world champions succeeded themselves, Arie Van Vliet of the Netherlands retaining the professional sprint title and Jan Derkens, a compatriot, keeping the amateur sprint crown. In the United States Gustav Kilian, good-will German cyclist, dislodged Tino Reboli

of Newark from the perch of national professional motor-paced champion, and Mickey Francoise of Montclair, N.J., replaced George Shipman as the national professional sprint king. The national amateur sprint crown was won by Buster Logan of Arlington, N.J. Ed Carafagnini of Chicago took the A.A.U. senior title and Chuck Edwards, also of Chicago, won the junior A.A.U. honours.

The revival of cycling in the United States was popularly accepted both as a sport and as an economic manifestation. The U.S. department of commerce reported that 1,130,736 bicycles were manufactured in the U.S. during 1940, within 50,000 of the banner year of 1899. A movement was in 1940 under consideration to further cycling in the national parks, and many cities were organizing bicycle clubs and planning extensive cycle paths. A network of paths in 20 countries was on the list of the American youth hostels. The New York city department of parks installed bicycle paths in 21 of its parks, having a total of nearly 60 mi. of paths, and in Westchester county paths will be constructed.

At Buffalo, Heinz Vopel of Germany and Cecil Yates of Chicago won the six-day international bicycle race, amassing a total of 170 points after 2,025 mi. of riding. When a similar event was held in Columbus, O., Gustav Kilian and Henry O'Brien were the top pair of riders. Vopel also paired with Cesare Maretto to win the 18-mi. international motor-paced race in 40 min. and 1 sec. The National Olympic Bicycle Racing championship was captured by Ed Carafagnini, the Chicago bicycle factory worker. The New York State championship was taken by Joe McKee of the Long Island Wheelmen's association. He won the one mile match race from George Brown of the Bronx Acme Wheelmen. Carafagnini also won the national A.A.U. road racing championship at Chicago, with John Crowder of New York second.

Various countries, including the United States, were training soldiers in bicycle corps to move from one town to the next and also to carry folding bikes as part of a parachuter's equipment. (T. J. D.)

Czechoslovakia. Formerly a republic in Central Europe, Czechoslovakia was dismembered in the fall of 1938, when Germany, Hungary and Poland annexed about one-third of the territory of the republic, and finally ceased to exist in March 1939, when Germany annexed as a protectorate the remaining part, inhabited by Czechs (see BOHEMIA AND MORAVIA). The most eastern part inhabited by Carpathian Ukrainians became part of Hungary (see RUTHENIA), and the part inhabited mainly by Slovaks was established as a nominal independent state under German protectorate (see SLOVAKIA). In spite of this dismemberment the Czechoslovaks continued to hope and to work for their national resurrection. The European war aroused in the Czechs and Slovaks the expectation that Czechoslovak democracy and independence would be revived. Most of the national leaders found themselves at the beginning of the war in France and in Great Britain. The oppression of the countrymen in Central Europe increased their will to resistance and even induced members of the German-protected government of Bohemia and Moravia, Dr. Jaromir Nečas and Dr. Ladislav Feierabend, to arrange their escape abroad, where they joined the other leaders of the revolutionary Czechoslovak movement.

This movement was under the leadership of Dr. Eduard Beneš who as successor of Thomas G. Masaryk had been the last president of the democratic republic of Czechoslovakia. He was reco-

nized in 1940 as being still president of the Czechoslovak republic not only by the large Czechoslovak populations in the United States and in the democratic countries of Europe, but also by Great Britain. In the summer of 1940 when the Czechoslovak army, which had fought on the side of the allies in France against Germany, had succeeded in extricating itself from the chaos of French defeat and in re-organizing itself in Great Britain, a full-fledged Czechoslovak government was formed in Great Britain and was recognized officially by the British government on July 21 as the legitimate government of Czechoslovakia, representing its nation as the governments of Queen Wilhelmina or King Haakon VII were representing the Netherlands and Norway. A Czechoslovak cabinet was formed comprising 11 ministers, of whom six were Czechs and five Slovaks. Monsignor Jan Šrámek, the former leader of the Catholic People's party in Czechoslovakia, became prime minister and Jan Masaryk, formerly Czechoslovak minister in London, became minister of foreign affairs. The Czechoslovak military formations were organized as an independent army and on Oct. 25 the British and the Czechoslovak governments signed an agreement which established the Czechoslovak army under its own command and general staff as a part of the allied forces. A further step in the consolidation of the Czechoslovak administration was taken on Dec. 10 when President Beneš formed a state council of 40 members, with the former leader of the Czechoslovak Social Democrats, Rudolf Běchyň, as chairman. This council consisted largely of former senators and deputies of the Czechoslovak parliament who had succeeded in escaping to Great Britain. It was a purely provisional body which was later to give way to the democratically elected new parliament after the liberation of Czechoslovakia. An important step for the future reconstruction of Central Europe after the war was taken when the Czechoslovak government issued with the Polish government a joint declaration on Nov. 11, 1940, in which the two governments pledged close co-operation in the future in the political and economic field and for military defence. The hostile attitude of Poland toward Czechoslovakia before 1939 had been one of the most important elements in facilitating German expansion in Central Europe and had had fatal consequences not only for Czechoslovakia, but ultimately for Poland herself. In a new spirit the Polish and the Czechoslovak governments declared the past period of discord and recrimination was closed, and that their future close association would form a basis for the new order in Central Europe and a guarantee of its stability. President Beneš thus resumed the policy which he had pursued before the dismemberment of Czechoslovakia and which had always aimed at close and peaceful co-operation between Czechoslovakia and all her neighbours. Dahomey: see **FRENCH COLONIAL EMPIRE**.

Dairying. The year 1940 brought a substantial degree of increasing prosperity to all branches of the dairy industry in the United States. Both production and prices advanced. Increased industrial activity, caused by the national defence program, broadened the buying power and maintained a steady to advancing market for fluid milk and manufactured dairy products in the United States. While the export demand for most United States farm products declined steadily through the year, the demand for manufactured dairy products for export mounted steadily, particularly for condensed, evaporated and dry milk shipped to the United Kingdom. In contrast, competition of European cheese with United States cheese vanished from American markets as imports of European cheese into the United

States virtually ceased after the surrender of France to Germany. Normally European cheese imports constituted about 10% of United States cheese consumption. With the disappearance of these imports, large shipments of South American cheeses appeared in the United States. These came principally from Argentina, although a smaller quantity came from Brazil.

They represented the first large imports of South American cheese into the United States. Owing to increased domestic buying power and consumption the index of farm prices for United States dairy products reached 116 by mid-Oct. 1940, compared with the index of prices of the period from 1909 to 1914. At the same time the index for all farm products stood at 99 while that for meat animals, which caused the largest percentage of increase in farm income in 1940, was 112. Average retail price for butter the first nine months of 1940 was 35.1 cents per lb. compared to 32.5 cents in 1939. Average price paid farmers for butter fat the first nine months of 1940 was 22.3 cents per 0.8085 lb. compared to 19.6 cents in 1939. Average retail price for cheese the first nine months of 1940 was 25.8 cents per lb. compared to 25.3 cents in 1939.

Average price paid farmers for milk by Wisconsin cheese factories the first nine months of 1940 was 13.1 cents for 10.43 lb. of milk compared to 12.1 cents in 1939. Average retail price of evaporated milk in 1940 was 7.7 cents per lb. compared to 7.5 cents in 1939. Average price paid farmers by condenseries the first nine months of 1940 was 3.08 cents for 2.3 lb. of 3½% milk compared to 2.85 cents in 1939. In November, prices of butter futures on the Chicago Mercantile exchange made a new top for the years 1938–40. Milk production throughout 1940 was at a high level and on Nov. 1 production per cow was 4% above the same date in 1939 and the highest on record for that date.

During 1940 the number of cows on United States farms increased by about 500,000 head. Feed supplies were ample to sustain still further milk production, the four principal grain feeds, including the 1940 corn crop, constituting a supply of 113,000,000 tons, the highest in 20 years. Production of manufactured dairy products in the United States, creamery butter, cheese, evaporated, condensed and dried milk and ice cream, increased 16% in the 1930–39 period while population increased only 6%. (For details of production and consumption see **BUTTER**; **CHEESE**; **MILK**.) (S. O. R.)

Daladier, Edouard (1884–), French politician, of whom a biographical notice will be found in *Encyclopædia Britannica*, vol. 6, p. 985. Minister of war in 1925, president of the Radical-Socialist party after 1927, he formed in 1933 a ministry which lasted ten months, and then served under Sarraut and Chautemps. In 1934 he formed another government which, as a result of the riots following the Stavisky scandal, lasted only a few days. Minister of war after 1936 in various *Front Populaire* governments, in April 1938 he became prime minister.

Daladier's war cabinet, formed Sept. 13, 1939, after the declaration of war against Germany, fell on March 20, 1940, when the chamber of deputies withheld a vote of confidence, partially because of France's failure to give effective aid to Finland. His successor, Paul Reynaud (*q.v.*), retained Daladier as minister of defence and war (and later foreign minister) until June 6, when he was dropped from the cabinet. On July 23 the Vichy government ordered him to be tried, along with other former officials, on charges of responsibility for France's defeat. He was taken into custody Sept. 7 and formally arrested Nov. 17 to await trial before the Riom court.

Dams. The table above includes only 20 of the many important dams completed or under construction during 1940. Widely scattered over all the world, a large proportion were being built for irrigation purposes.

The largest of these were in the United States. Grand Coulee, world's largest concrete dam, neared completion with more than 95% of its concrete in place.

Shasta, second largest, part of the great Central Valley project in California, received its first bucket of concrete on July 8 following the completion of over 4,000,000 cu.yd. of foundation excavation begun in 1938. On the extensive 30-mi. relocation of the Southern Pacific railroad the last of the 12 tunnels was holed through in June. Two unique structures are required in building this dam. One is the $\frac{9}{16}$ -mi. belt conveyor which is used to transport sand and gravel for the concrete to the dam site. The other is the 460-ft. high steel tower, from the top of which seven cableways radiate to deliver concrete to all parts of the dam. Heavy rains in January and February, finally culminating in the worst flood of record on the Sacramento river, delayed the work, severely damaging the bridges for the belt conveyor, access road and railroad relocation. On another section of this project, the first bucket of concrete was placed, July 29, in Friant dam, world's fourth (Boulder is third) largest concrete dam.

The outstanding event of the year 1940 in the field of dams was the final completion of Fort Peck, world's largest dam, under construction since Oct. 1934, containing 122,700,000 cu.yd. of hydraulic earth-fill. The upper 25ft. of fill was constructed during 1940 by transferring material from the previously built downstream face of the dam itself.

Kingsley dam, second largest earth-fill, was also nearly complete. The top 20ft. of fill remaining will be taken from excavation for the auxiliary spillway, and will be rolled in place.

Stevens dam, the highest of its type in the world, was changed in July from an earth-fill to a rock-fill with an earth core. This was necessary when it was found that the proposed material for the dam contained an objectionable percentage of fine clay. The wet climate would have made placing of this material quite difficult and the change was also expected to facilitate construction by making work possible even during the rainy season. The change in type reduced the total quantities in the dam by about 900,000 cu.yd. Foundation preparations were in progress at Merriman dam, large earth-fill for New York city's water supply. Twelve of the 18 reinforced concrete caissons being sunk 180ft. to rock have been completed. These caissons will form a cut-off

wall to prevent seepage under the dam, similar to that built Windsor dam in Massachusetts, completed in 1939.

In spite of war conditions work proceeded on the Haweswater dam, vital water supply project for Manchester, Eng., and work on a large multiple-arch dam was started on the Kromme river in South Africa to supply water to the city of Port Elizabeth. Kalkfontein dam, second largest in Union of South Africa, completed. Built for irrigation on the Riet river, it is 111 ft. high, 1,040ft. long and contains 270,000 cu.yd. of rock-fill.

Although the concrete core wall for water tightness has been generally abandoned on earth dams in the United States because of its inflexibility, the Pegu-Yomas dam in Burma was completed in 1940 with such a wall used for want of good core material. The wall is 130ft. high and 350ft. long, built in panels of reinforced concrete and designed to withstand the earthquake typical of that locality. It was expected that this wall could deflect as much as 16ft. at the centre without causing leakage. The dam was built for the water supply of the city of Rangoon. (See also AQUEDUCTS; IRRIGATION; WATER POWER.)

(W. P. C.)

Dance. Continuation of the European war, and of general jitters in the United States, made for the rising popularity of social dancing during 1940. The hectic pace echoed by the headlines was reflected in the more spirited types of dancing prevailing on ballroom floors in the U.S.

Greatest strides were observed in the Latin-born routines, perhaps to the political and economic emphasis on Latin-American relations. The rumba, Cuba's contribution to torrid dancing, reached its crest during 1940, and the conga soared to new heights of popularity. Night clubs and cabarets, in the Latin motif, mushroomed into being all over the continent. Many cafes installed a rumba band to alternate with a U.S. orchestra so popular has Latin dancing become. The great success of the conga can be attributed to the fact that it is ideally adapted to group participation. The conga can be performed in the traditional couple formation, or, like the Lambeth Walk, can be executed as a group performance. Arthur Murray capitalized the dance's group characteristics and created the American conga wedding the thoroughly American Virginia reel with the Latin conga. The Rumba-Reel, another Murray creation, which gained popularity at the year's end, is an Americanization of the rumba.

The Virginia reel itself, along with other U.S. folk dances

Below, right: ROZA DAM, on the Yakima federal irrigation project, Washington, was completed in 1940

enjoyed renewed popularity during 1940. Hillbilly music, back-to-the-soil movements, and "gay '90s" trends have all helped to revive this typical U.S. country dance. Revived in the middle west of the U.S. early in 1939, the Virginia reel was picked up in New England, and, by the end of 1940, was quite a favourite in all parts of the country.

Jitterbug dancing continued to thrive in certain sections, with the Lindy Hop enjoying a renewed popularity. With swing bands still in the limelight, the younger and more energetic dancers have refused to relinquish this type of dancing which many predicted would end in 1940. "Jitterbugging" was probably the factor responsible for the appearance, in great numbers, of Saturday night social dance clubs all over the U.S. This type of affair was especially popular in the big cities, and was well patronized by the younger dancers in search of swing and the chance to widen their acquaintanceship. The swing dancers were also in the majority at the San Francisco and New York world's fairs' open-air public dancing festivals.

England, which in previous years has contributed such "polite" routines as the Lambeth Walk, the Chestnut Tree, and the more recent Booms-a-Daisy, was too much occupied with more trying events to interest the U.S. in a new dance in 1940. Those three aforementioned British dances were declining steadily in popularity in the United States.

A dance which made its initial appearance in 1940 was La Varsoviana, which combines the graceful mazurka with the schottische. La Varsoviana was featured in the Columbia picture, *Arizona*. The U.S. motion picture industry, incidentally, once again placed emphasis on dancing as a social grace during 1940. The year saw the art exploited in such pictures as *Dance, Girl, Dance*; *Down Argentine Way*; *Dancing on a Dime*, and the Fred Astaire picture *Second Chorus* in which Arthur Murray's newest routine, "Dig-It," was introduced. (A. Mu.)

Folk Dancing.—In the United States folk dancing is represented by two types: the Indian dance rituals or ceremonials, carried on chiefly in the pueblos of the southwest, which are a definite part of Indian life bearing actual relationship to their existence; and folk dancing of a social and recreational nature enjoyed in all sections of the country by uncounted thousands.

During 1940, the Indian dance rituals were doubtlessly witnessed by more visitors than ever before, attracted to New Mexico and Arizona by the Coronado Cuarto Centennial celebration. This celebration likewise stimulated a widespread revival of the Spanish-American dances of this section and of the pioneer square dances of Anglo origin. From January through December more than 150 folk festivals were held in the schools, villages and cities throughout New Mexico.

In the U.S. as a whole, reports from many sources indicate a marked increase in folk dancing of the social or recreational type, with early American dances the widespread favourites. For example, the Work Projects administration recreation program with its country-wide activity estimated a 33% increase in the number folk dancing under their leadership. At least 200,000 dance together monthly, representing over 2,000 groups, half of which meet weekly. It was further estimated that 75% of these dancers were married couples over 30.

Colleges and universities in 29 out of the 32 states heard from reported regular social events featuring folk dancing and, in many cases, enthusiastic coed square dance groups meeting weekly. From the National Grange came word that folk dancing, especially square dancing, was being featured in some granges in nearly all the 37 states in which the grange was organized. In the rural areas rise the colourful personalities of "callers" and their musicians. The old timers reported a far larger percentage of young folks and greatly speeded tempo.

The usual annual festivals and institutes were held in 1940, as follows: folk dance leadership sections at the 25th National Recreation congress, Cleveland, Ohio; 20th May festival at Pine Mountain Settlement school, Kentucky; 14th Spring festival of the Country Dance society (formerly English Folk Dance and Song society) in New York city, and their 1st summer school in Massachusetts; 13th Mountain Dance and Song festival, Asheville, N.C.; 11th short course at the John C. Campbell school, Brantown, N.C.; 10th American Folk Song festival at Traipsin' Womaps, Kentucky; 9th White Top festival, Virginia; 9th Spring festival of the foreign language department of Montclair State Teachers' college, Montclair, N.J.; 8th Vermont State festival in Plainfield; Texas Cowboy Christmas ball, Anson (held originally in 1885, revived in 1933); 1st International festival in Milwaukee, Wis.; 7th National Folk festival, Washington, D.C.; 6th International festival, Denver, Colo.; 5th Mountain Folk festival of the Conference of Southern Mountain Workers, Knoxville, Tenn., and their 3rd Folk Dance school, Berea, Ky.; 5th National school of the Co-operative Society for Recreational Education, Tiffin, O.; International festival of the International Institute of Boston, Mass.; Folk festival of Dauphin County, Harrisburg, Pa.; 5th Christmas festival of the University of California in Los Angeles; 5th International festival in the cultural Olympics, University of Pennsylvania, Philadelphia; 1st festival of College of Fine Arts, University of New Mexico, Albuquerque; 2nd Connecticut Dance and Song festival, Storrs; County festival, Morgantown, W.Va.; Square Dance festival, Storwotton Village, West Springfield, Mass.; Old Timers' Day square dance at El Paso's Sun Carnival, Texas, led by famous Bluebonnet club; Robinson Harvest festival, University, Kentucky; International festivals at International houses of Berkeley, Calif., Chicago, Ill., and New York city, at International Center, Baltimore, Md., and at International institutes of Boston, Duluth, Fresno, Los Angeles, Lowell, Mass.; New York, Providence, Toledo and Trenton; Short course and festivals of the Co-operative Recreation service, Delaware; Folk Dance institutes at Henry Ford's county school, Ways, Ga., at Greenfield Village, Dearborn, Mich.; Girl Scout and Camp Fire Girls festivals; recreation conferences of Co-operative Youth Councils of Ohio; Grape festivals and Basque Pique-Nique, California; and the year-round festival of Mexican dance, drama and song, Padua Hills theatre, California.

For the first time in 1940, folk dancing was included in the fashionable Kentucky Mountain Laurel festival in Pineville. State-wide recreation institutes were held in Indiana, leading to a State Play-Party festival in Kokomo, sponsored by the agricultural extension department of Purdue university and the International Church Youth; a Pre-Convention Working Dance conference was held at the University of Chicago under the National Dance Section of the American Association for Health, Physical Education and Recreation; an intensive Western American Dance institute took place at the Cheyenne Mountain school, Colorado Springs, Colo.; and a five-months' American-International festival was carried on as part of the program of the American Common, World's Fair 1940 in New York city.

Outstanding in their far-reaching influence in the folk-dance field in 1940 were Benjamin B. Lovett and his staff, operating from Greenfield Village, Dearborn, Mich., and Dr. Lloyd Shaffer and his Cheyenne Mountain Dancers, Colorado Springs, Colo. (P. Pa.)

Ballet, art dance of the theatre grown from classical traditions, thrived in 1940 despite the spread of war. Evacuees from Europe swelled the lists concentrating activity in the western hemisphere while Australia and New Zealand welcomed De Basil's Original Ballet Russe in an eight months' season.

Under bombs in England, ballet carried on. The Vic-Wells company escaped from Holland at the brink of the invasion, toured the British provinces, extended its season at Sadler's Wells and produced new works: *Dante Sonata* and *The Wise Virgins* (Arton) and *The Prospect Before Us* (De Valois). In August M. De Valois revived her *Barabau*, a topical laugh at dictators. The Arts Theatre ballet, the Ballet Rambert and the London ballet combined in the Arts Theatre club, gave lunch, after-lunch and tea performances, "with snacks in the foyer-shelter," to circumvent blitz and black-out. The *Dancing Times* published regular

In South Devon the Jooss ballet maintained its school until leaders, Kurt Jooss and Sigurd Leeder, were interned, when remaining students, mostly Dutch, continued under direction of Pem Becker. The company (Fritz Cohen, musical director) toured part of the United States with *Chronica* (dance-drama dictatorship) and the revised fairy ballet, *A Spring Tale*, missed the scheduled New York spring season of full repertoire (ten original ballets) because of theatre tie-up, and soon embarked

For their first South American tour, which became extended by return engagements.

The Original Ballet Russe gave four world premières in the Antipodes: Schwezoff's *Eternal Struggle*, Lichine's *Graduation Ball* and Verchinina's *Devotion* and *Étude*, which had American premières in Los Angeles in Oct. 1940, together with Lichine's *Protée*, Fokine's *Paganini* and *Cinderella*. Following a short Chicago season, the company opened an indefinite engagement at the Fifty-first Street theatre, New York, at the close of the Monte Carlo ballet's three weeks' stay, S. Hurok managing both companies. Lichine's version of *The Prodigal Son* and Lifar's *Pavane* were other new works in a repertory of 50 ballets.

Newcomers to these ranks were: Schwezoff, author of the prize-winning autobiography, *Borzoï* (in England); Lifar, touring the Antipodes but not the United States; Nemchinova, formerly of the Diaghilev ballet; Panaieff; Skibine; Toupine and a new set of "baby ballerinas"—Denisova (from Vancouver), Moulin, Leskova, Svetlova and Stepanova. Baronova, who had toured South America as guest artist with the Monte Carlo company, rejoined De Basil for the American tour, thus (with Toumanova and Riabouchinska) bringing the three "baby ballerinas" of the first seasons together again. The nucleus remained as before.

Detoured by war from its annual spring season in Monte Carlo and subsequent engagements in European capitals, the Ballet Russe de Monte Carlo, Leonide Massine, artistic director, made its first tour of South America instead, giving 65 performances in five of the major cities. In Oct. 1940, the company, the personnel practically intact as of previous seasons, opened the fall season at the Fifty-first Street theatre, New York city, since the Metropolitan Opera house, their usual centre, was in process of renovation and at the end of the engagement the company departed for the annual transcontinental tour.

The five novelties were: Massine's *The New Yorker* and *Vienna—1814* in world premières; the Stravinsky-Balanchine *Poker Game* and Tschaikovsky-Balanchine *Serenade*, both originally produced by the former American ballet; and a revival of the Tschaikovsky-Petipa *Nutcracker*.

The new Ballet theatre, a U.S. institution of international make-up and outlook, made its debut at the Center theatre, New York in Jan. 1940, with a distinguished array of dancers, choreographers, composers and stage designers, all collaborating in fresh productions including restyled revivals of the classics. Loring's *The Great American Goof* (Saroyan, librettist) was one of the chief novelties. Bolm contributed *Peter and the Wolf* and his revised *Mechanical Ballet*; Fokine, *Les Sylphides* and *Carnaval* restaged under his direction; Mordkin, *Voices of Spring*. Dolin restaged *Giselle* and *Swan Lake* and presented his new *Raymond Scott Quintet*; Tudor brought *Jardin aux Lilas*, *Dark Elegies* and *Judgment of Paris*; Howard, *Lady into Fox* and *Death and the Maiden*. De Mille created *Black Ritual* for the Negro section, Fernandez, *Goyescas* for the Spanish. Shabelevsky did an *Ode to Glory* in honour of Poland, his fatherland. Nijinska furnished new choreography for Mordkin's production of *La Fille Mal Gardée*.

THE "BOMBER PARADE," a new British dance of 1940, was a rhythmic parody of German attempts to knock out Great Britain from the air

The season stopped short at the end of three weeks' brilliant success. The company gave a series of summer performances at the Lewisohn stadium and in November joined the Chicago Opera for a six weeks' season, offering there several new works among many planned for the New York season in Jan. 1941.

Ruth Page and Bentley Stone, with an enlarged company, made a Latin-American tour in the region of Caracas and Curaçao. Margaret Wallman directed opera ballet in Buenos Aires. The Graff ballet made an eastern tour during the winter, retiring in summer to a co-operative farm in Vermont to prepare for a more extended tour in the fall.

Ballet made its second appearance as an advertising medium when Kirstein's American Ballet Caravan, assisted by other dancers, gave continuous performances in the Ford Motor company theatre at the World's Fair of the ballet skit, *A Thousand Times Neigh*. (Lenthéric Perfumes had previously produced little ballets in department stores as part of an advertising campaign.) Kirstein reorganized the School of the American Ballet, as president, and was instrumental in founding the Dance Archives at the Museum of Modern Art.

Ice ballet stepped out of the arena into the Center theatre in the fall, with the "icetravaganza," *It Happens on Ice*, dances staged by Catherine Littlefield, who also staged the dances for the World's Fair's *American Jubilee*, notable for its bicycle ballet.

Balanchine staged dances for several shows. Zorina appeared in *Louisiana Purchase* (Broadway musical) with Charles Laskey, partner, and in the motion picture, *I Was an Adventuress* (Lew Christensen of the American Ballet Caravan, partner); Baronova in M.G.M.'s *Florian*. Walt Disney's *Fantasia* utilized ballet technique from living models for cartoon drawings. Radio talks on ballet and radio interviews with ballet artists were frequently given.

BIBLIOGRAPHY.—United States: Serge Lifar, *Serge Diaghilev, an Intimate Biography* (1940); Ruth Eleanor Howard, editor of the *American Dancer*, published *Dancer's Almanac* and *Who's Who*, 1940. In England, Arnold Haskell published another ballet picture-book, *Tribute to Poland*.

Concert dance, embracing Spanish, oriental, modern and other forms of art dance performed in solo or group recitals as distinguished from the theatrical presentations of ballet, also concentrated in the United States in 1940 as the result of war conditions and opened up channels of exchange between the Americas.

From conquered countries, where dancing was either banned or curtailed along with other expressions of the free spirit of man,

VERA ZORINA danced to critical acclaim in *Louisiana Purchase*, a top musical show of 1940

fled many refugees, the Viennese dance-mime, Lotte Goslar, among them. Total silence submerged Mary Wigman and her followers in Germany. Harald Kreutzberg, detained in nazi-held territory from what would have been his eleventh United States tour, remained incommunicado.

New York, in 1940 the dance capital of the world, was the clearing house for a concert dance as polygenous as its people. Here debuts were made—in the Spanish field by Carmalita Maracci, Manuela del Rio, La Trianata, Cuquita Blanco, Ana Maria; in the Negro by Katherine Dunham of Chicago, whose hit program, "Tropics and Le Jazz 'Hot,'" was repeated on ten consecutive Sunday evenings by request, and who later with her company scored another hit in the Broadway Negro show, *Cabin in the Sky*. From Korea came Sai Shoki; from Bali and Java, Devi Dja and her native dancers and musicians. And there were al-

ready active in the metropolis alone, and to a lesser degree in the rest of the country, more African, Hindu, Jewish, oriental, Spanish and other specialists, American and native, as well as modern American dancers, than there is space here to list.

At the beginning of her fall tour across the continent, Argentina introduced a new male partner, Federico Rey, into her Spanish ensemble, and décor into some of her dances. Triana, her former partner, was said to have joined Carmen Amaya, Spanish gypsy dancer whom Hurok had brought from South America (American debut deferred until 1941).

La Meri, American ethnological dancer, forced home from foreign travels, toured extensively, and in conjunction with Ruth Denis in New York founded the School of Natya, where for many years nightly programs of eastern dances were popular. Huapala, another American girl (Vivienne Mader), toured with her group of Hawaiian islanders in programs of authentic Hawaiian dances. Ang Enters, world-commentator in dance-mime, added an Hawaiian engagement to her annual transcontinental tour. Reginald and Gladys Laubin continued their work in the American Indian dance. Miriam Winslow and Foster-Fitz-Simons toured United States and parts of Canada and arranged for a South American tour in the spring of 1941. Ted Shawn disbanded his men dance at the peak of success. Anna Sokolow at invitation of the Mexican government established the first professional modern dance group in Mexico.

The pioneers and chief exponents of the modern American dance—Martha Graham, Doris Humphrey, Charles Weidman and Hanya Holm, former Wigman dancer now resident in the United States, continued to teach, tour, experiment and produce new works. Experiments included use of words with movement, appearances in television, radio talks and private movie-making.

In August, Graham produced a new composition on Emily Dickinson, *Letter to the World*, and *El Penitente* at the Bennington festival sponsored by the former Bennington School of Dance which became in this its seventh season the Bennington School of the Arts.

The Humphrey-Weidman company opened a new studio-theater on West 16th street, with a festival series of performances during the Christmas holidays, in which Humphrey's *Song of the Witches* and Weidman's *Flickers* were added to their large repertory including Humphrey's *Square Dances* and Weidman's *On a Mother's Side*, done on tour. Lester Horton and his group were active on the west coast, where Mills College also conducted a summer school of dance dedicated chiefly to the modern form. Tamiris (Margaret Severn), reopened activities in New York.

While the trend of the modern dance is toward theatre—a substantial, full-length production, with some décor, more lavishly costumed, and small orchestra when possible supplanting the program of short pieces against a plain cyclorama, in stark costume with piano and percussion the sole music, of earlier, experimental days—the question of finance has so far prevented its full development in this direction.

The schools and colleges throughout the land have done much to sponsor the modern form. In New York the Washington Irving high school and the Young Men's Hebrew association each maintain a notable annual series of events which include the best of all kinds of concert dancers.

Daniels, Arthur Hill (1865–1940), professor emeritus of the University of Illinois, was born in East Medway (now Millis), Mass., Oct. 19. He was educated at Olivet College and Yale and Clark universities, receiving Ph.D. degree from Clark in 1893. He joined the faculty of

University of Illinois the same year as an instructor in philosophy, becoming a full professor in 1899. Later he served at various times as acting dean and as dean, and in 1933-34 he was acting president, after which he became professor emeritus. He died in Urbana, Ill., April 2.

Danube, Control of. On March 1, 1939, Germany was given a seat on the International Danubian commission, while Rumania was accorded full sovereignty over the lower reaches of the river. On Sept. 17, 1940, Germany abolished the commission and replaced it with a "consultative committee" on Danubian affairs, under a permanent German director, Dr. George Martius. This new committee was composed of delegates from Italy, Hungary, Bulgaria, Yugoslavia and Slovakia, to be convened and adjourned by the director. The soviet union then demanded and received representation on the committee. These changes brought the great water highway under the control of the Berlin-Rome axis, and ended the international regime established in 1856. (S. B. F.)

Dartmouth College. The total student enrolment in 1940 was 2,431. The number on the faculty and administrative staff was 297. Support of Dartmouth alumni through the annual alumni fund campaign again provided funds for current use that enabled the trustees to avoid a substantial deficit. The alumni fund collections were \$126,255.90, received from 10,181 contributors. Another notable achievement on the alumni front was the success of Hanover holiday, or the alumni college, held during the week following commencement. Attendance of more than 200 at the lectures and discussions led by members of the faculty again proved the popularity and significance of postcollege education in the alumni body.

A major project ahead, designed to benefit both curricula and extracurricula activities in certain branches of the arts, is the proposed new centre for drama, music and radio. During the year plans were completed for the \$1,000,000 centre and approved by the trustees. Construction is contingent upon securing funds for the project. The Dartmouth centre will be used during the summer of 1941 for a drama festival of national scope and importance. (S. C. HA.)

Daudet, Julie Allard (1847-1940), French writer, widow of Alphonse Daudet, was born in Paris. Under the name of Marguerite Tournay, she began to publish poetry in 1865, two years before her marriage to M. Daudet. She later contributed to Paris reviews, signing her articles Karl Steen. Her best-known books are *Impressions de Nature et d'Art* and *L'Enfance d'une Parisienne*. She was a Knight of the Legion of Honour and a member of the jury of the Prix Femina. She was the mother of Léon Daudet, a leader of the French Royalist party. She died in Paris, April 23.

Daughters of the American Revolution.

The national society, Daughters of the American Revolution, organized Oct. 11, 1890, makes eligibility for membership dependent upon direct descent from a patriot who aided in securing American independence. Membership Dec. 1, 1940, approximated 143,000 in 2,550 chapters in every state and in many countries.

Activities of 1940 included the issuing of 380,000 manuals for citizenship published in 18 languages, to aid in naturalization; instruction in the use of leisure and respect for the rights of others of 147,000 children in Junior American Citizens' clubs; gifts of \$90,000 for 16 approved schools for foreign-born and southern mountaineers. Improvements for these schools included

a boys' dormitory, two health houses, a library building, a model farm, teachers' cottages, classrooms and kitchens. Two of these schools, Tamasee in South Carolina and Kate Duncan Smith on Gunter mountain in Alabama, with approximately 700 pupils, are completely owned and operated by the D.A.R. Loans were made to 565 students. About 5,000,000 penny pines were planted in all states of the union in commemoration of the national society's 50th anniversary. Three social workers were maintained in the detention rooms at Ellis island and for occupational therapy among men of the coast guard and merchant marine confined in the Marine hospital. Individual state projects in commemoration of golden jubilee included erection of an outdoor theatre for public use, restoration of important historical buildings, endowed rooms in hospitals, etc. A high school senior from every state, winner of the Good Citizenship contest, was given a trip to Washington. About 50,000 copies of *National Defense News*, designed to promote confidence in fundamentals of American democracy, were distributed. Eighteen thousand copies of the constitution of the United States were given upon individual requests following radio programs. Three thousand medals for good citizenship were awarded. Distribution of Flag Codes and other patriotic literature reached into hundreds of thousands. The society publishes the *National Historical Magazine*. A genealogical library of 32,000 volumes and an early American museum are open to the public in the society's headquarters, Memorial Continental hall, Washington, D.C.

Davies, William Henry (1871-1940), English poet, was born in Newport, April 20, and died at his home in Nailsworth, Gloucestershire, Sept. 26. For a biographical sketch see *Encyclopædia Britannica*, vol. 7, p. 83.

Davis Cup: see TENNIS.

Dawes, Rufus Cutler (1867-1940), U.S. financier, was born in Marietta, Ohio, July 30. He was a kinsman of William Dawes, who rode with Paul Revere to warn Concord and Lexington of the British plans to attack them. After graduation from Marietta college in 1886 he was associated with his father in the lumber business. In 1897 he went to Evanston, Ill., as president of the Northwestern Gas Light and Coke company and for the next 30 years he was active in the management of gas and electric companies in association with his brother, Charles G. Dawes. He was president of Chicago's Century of Progress exposition, 1933-34. Following the World War of 1914-18 he served as adviser to the commission which drew up the plan for the settlement of the German reparations question and he became assistant to Owen D. Young as general agent of reparations. He died in Chicago, Jan. 8.

Deafness. **Hearing Aids.**—Individuals who have difficulty in hearing ordinary conversation in office, home or in relatively quiet places at a distance of six feet or less may be helped by the use of a hearing aid. A clinical examination, including an audiometric test of the deafened person, will usually indicate to the otologist whether or not the instrument will help.

In 1940, manufacturers emphasized the so-called vacuum tube hearing aid employing tiny thermionic tubes installed in miniature amplifiers. Vacuum tube hearing aids, weighing approximately 25oz. complete, consist of a small crystal microphone and miniature amplifier built in a wearable case (5oz.), A and B batteries (18oz.), a receiver (2oz.) and wire connections. The receiver may be of two types: air conduction, a small button type receiver fitting closely in the better ear; or bone conduction, a receiver

supported by a spring headband and resting on the mastoid back of the ear. An otologist's examination can usually predict which method, bone or air conduction, will be the more satisfactory.

Carbon granular microphone hearing aids, weighing approximately 250z. complete, are marketed. They are giving reliable service although the trend appears to be toward vacuum tube aids.

The cost of operating the two kinds of aids is about the same; however, the carbon granular hearing aids may be slightly less expensive in battery and upkeep cost. The vacuum tube aid is comparatively new and may have defects which are not readily discernible, whereas the carbon granular hearing aid has been in use for many years and is considered a rugged instrument.

A list of accepted hearing aids may be obtained from the Council on Physical Therapy of the American Medical association. The council has also compiled requirements for acceptable electric hearing aids and audiometers, copies of which may be obtained by writing to the office of the council. (See also EAR, NOSE AND THROAT, DISEASES OF.)

Deaths (of prominent persons in 1940): see OBITUARIES.

Death Statistics. According to provisional reports, which never deviate very far from the final, there were 1,387,797 deaths in the United States during 1939 and the corresponding death rate was 10.6 per 1,000 of total population. In the same year, Canada recorded 108,874 deaths and a death rate of 9.6 per 1,000 population. There were 499,192 deaths reported for England and Wales during 1939, excluding non-civilian deaths on and after Sept. 3; the death rate was 12.1 per 1,000 population.

Death rates for a number of countries for the most recent year available will be found in the appended table. Only four of these countries had death rates below 10 per 1,000 population in 1939, namely, Australia (9.9), Canada (9.6), the Netherlands (8.7) and New Zealand (9.2). Countries with death rates greater than 20 per 1,000 population in recent years are: British India (24.3 in 1938), Chile (24.6 in 1939), Egypt (26.4 in 1938) and Mexico (22.3 in 1939). Many backward countries without adequate mortality records undoubtedly experience death rates even higher than these.

Within the United States, the death rates per 1,000 population in 1939 were lowest in North Dakota (7.7), South Dakota (8.0), Oklahoma (8.0) and Arkansas (8.1). They were highest in Arizona (14.2), New Mexico (14.1) and Florida (12.8). The death rates for the five most populous states were: New York (11.5), Pennsylvania (10.6), Illinois (11.0), Ohio (11.4) and California (12.5).

The death rate for the United States in 1939 was not far different from that in 1938; however, the figures for these years are only two-thirds of that prevailing at the beginning of the century, when the death rate was 17.6 per 1,000. According to current indications, the death rate for 1940 will be about as favourable as in the two previous years. In England and Wales, the death rate in 1939, namely 12.1 per 1,000, was somewhat higher than that for 1938 (11.6 per 1,000). According to the appended table, the death rates for England and Wales have hovered about 12 per 1,000 since 1920.

An analysis of the mortality statistics for the United States in 1938 according to cause of death showed the following ten rubrics to be the most important (the first figure shows the number of deaths and the figure in parentheses, the death rate per 100,000 population): heart disease, 350,168 (268.9); cancer, 149,214 (114.6); cerebral haemorrhage, cerebral embolism and thrombosis,

Annual Death Rates per 1,000 Total Population in Certain Countries for 1939 and for Each Year in the United States and in England and Wales from 1900 to 1939.

Country	Death rates per 1,000 in 1939	Year	Death Rates per 1,000	
			United States (b)	England and Wales
North America		1900	17.6	18.2
United States	10.6	1901	16.5	16.0

Union of South Africa (Whites)	9.4 (a)	1938	10.7	11.6
		1939	10.6	12.1

(a) Death rate for 1938.

(b) For years prior to 1933, the death rates relate to an expanding area within the United States.

111,567 (85.7); influenza and pneumonia, 104,443 (80.2); phritis, 100,520 (77.2); accidents 93,805 (72.0); congenital malformations and diseases of early infancy, 63,208 (48.5); tuberculosis, 63,736 (49.0); diabetes, 31,037 (23.8) and arteriosclerosis, 22,208 (17.1). These ten causes accounted for 78.9% of the deaths from all causes. There were 32,582 (25.0) motor vehicle fatalities included in the deaths from accidents.

In 1939, there were only 9 deaths of passengers carried on scheduled commercial airlines in the United States; the date of the last fatal accident in that year was March 26. A 17-month period elapsed before the next disaster on a commercial airline; this occurred on Aug. 31, 1940, and resulted in 25 deaths. Another fatal accident on Nov. 4, 1940, caused the death of 10 persons. Another on Dec. 4 also caused the death of 10 persons.

It is fitting to mention here the publication of a new *Manual of the International List of Causes of Death as Adopted for Use in the United States*. This publication, issued by the bureau of the census in 1940, is the fifth revision of the international list of causes of death and is based upon the proceedings of the International commission held in Paris, Oct. 1938. The new manual is used by state registrars of vital statistics, by the bureau of the census, and by life insurance companies for the classification of deaths according to cause of death.

The variation of the death rates per 1,000 in the United States for 1938 according to age, race and sex were as follows: ages under 5 years, 13.8; ages 5 to 9 years, 1.3; 10 to 14 years, 1.5; 15 to 19 years, 1.9; 20 to 24 years, 2.6; 25 to 34 years, 3.3; 35 to 44 years, 5.7; 45 to 54 years, 10.8; 55 to 64 years, 21.6; 65 to 74 years, 50.4; 75 years and over, 132.5. White males

all ages had a death rate of 11.3 per 1,000, while the rate for white females was 9.1 per 1,000. Among Negroes, the males had a death rate per 1,000 of 14.9 and the females of 12.7.

The expectation of life at birth corresponding to mortality conditions in the United States in 1938 was 62.12 years for white males and 66.20 years for white females. These figures are the highest yet recorded for the country. In the case of the white males, the gain in expectation of life at birth from 1901, the first year of record, to 1938 amounted to 13.89 years, while for white females, the gain was 15.12 years.

The gain in longevity since the beginning of the century is largely the result of substantial decreases in the incidence of the acute and infectious diseases. Thus, if the mortality conditions prevailing in 1901 had continued without change, about one-third of all babies born in that year would eventually have died from some acute or infectious disease; on the other hand, conditions in 1937 were such that only one-sixth of the babies would succumb to acute or infectious disease. Chronic disease would have claimed about one-half of the persons born in 1901, if the mortality picture of that year had remained unchanged; if mortality conditions of 1937 had kept constant, three out of every four persons born then would eventually die from chronic disease. The rise in the chances of eventual death from chronic disease is essentially a reflection of the diminished death rate from infectious (mainly acute) diseases unaccompanied by any comparable decrease in the death rates for chronic diseases, except that for tuberculosis. There has also been an increase in the chances of eventual death from external violence since 1901.

A classification of the deaths in the United States during 1938 according to the marital status at death showed that, among the males of all ages combined, the single numbered 216,489; married, 381,360; widowed, 139,737; divorced, 16,616; status not known, 10,700. Among the females, the number single was 141,445; married, 231,387; widowed, 233,070; divorced, 8,441; status not known, 2,146. It has been estimated that, among the married men who died within the year, about one quarter, or about 100,000 left widows at ages under 45; another quarter left widows at ages 45 to 54; a third quarter, at ages 55 to 64; and the last quarter, at ages 65 and over. (See also CENSUS, 1940.)

Debts, Government: see NATIONAL DEBTS.

Declaration of Panama: see HISPANIC AMERICA AND THE EUROPEAN WAR; INTERNATIONAL LAW.

Defence, National. The year 1940 covered the beginning of the most profound and far reaching developments in U.S. military and naval policy which had been seen in more than 20 years, that is, since the end of the World War in 1918. Some of those developments were important steps forward, some held promise of being such steps, and some were of very uncertain value. The evaluation of any military or naval policy must be made in relation to the military needs and the foreign policy of the nation concerned. It is essential therefore to begin this review of U.S. military and naval policy with a highly summarized study of U.S. foreign policy and the national problems arising out of that policy in dealing with other nations.

The dominant factor of that policy throughout 1940, and par-

ticularly as the year ended, was the war in Europe, and to a less but still important extent, the war in Asia between Japan and China, with its minor offshoot, the Thailand invasion of French Indo-China. At the opening of 1940 the war in Europe had fallen into a state of almost complete inactivity, except for the blockade activities of the belligerents. This period of stagnation encouraged the illusion in the U.S. that it would not be difficult for the United States to continue its neutrality. While sentiment favoured the allied powers (Great Britain and France), it was generally felt that their eventual victory over Germany and its still non-belligerent axis partner, Italy, was reasonably certain.

By the end of the year 1940 France had surrendered to Germany; Italy had become an active belligerent; Great Britain was desperately defending itself from savagely destructive air raids on its greatest cities; while it was being officially admitted by its most highly placed spokesmen that its hope of victory rested largely on very substantial aid from the United States; five sovereign nations of Europe had been completely overrun by Germany, two of which, besides France, had territorial possessions in the western hemisphere; Greece had been invaded by Italy without provocation, but had inflicted severe defeats on the Italians and had in turn invaded Italian Albania; and Japan had formally joined the Rome-Berlin axis and had adopted an openly hostile attitude to the United States and Great Britain in the western Pacific and the far east.

These events had shattered the happy illusions of safe isolation from the deadly problems of a revolution-swept world. From a comfortable tradition, the Monroe Doctrine had become a matter of grim concern, none too covertly challenged in the summer of 1940 by the foreign minister of victorious Germany and repeatedly sneered at and satirized in the officially controlled press of all three axis allies. The sudden hostility of Japan and her threats to move southward into the Dutch East Indies and French Indo-China, imperilling important U.S. economic interests, had driven home to the American nation the realization that, in the event of a British defeat, the three axis powers could mobilize for attack in both oceans combined naval forces greater than those possessed or in early prospect of possession by the United States.

In a vigorously contested presidential election, the two principal candidates, President Franklin D. Roosevelt (Democratic) and Wendell L. Willkie (Republican) agreed that U.S. interest required giving all possible aid to Great Britain to prevent its defeat. Within a few weeks after the American people had re-elected Mr. Roosevelt to a third term as president, he dropped all reservations that such aid should be "short of war." On Jan. 16, 1941, Mr. Willkie in an unscheduled extemporaneous statement at the Town Hall in New York strongly endorsed the main premise of the president's foreign policy. The so-called "isolationists" were still numerous and vocal, but the nation generally and soberly realized that the tide was running ever more strongly toward involvement in war for stakes vital to the continued existence of the U.S. republic.

The defence problems which these developments brought before the American people came as a great shock to the majority of them. They did not, however, present any basic problems which were new to the professional officers of the U.S. army and navy. To them the situation, suddenly become acute, rendered more vividly urgent many matters which had long been known to them, but with which inadequate public support had prevented them dealing.

From a purely military viewpoint, the isolationists insisted that the two oceans were still barriers to invasion of the U.S., a view which they stressed as months passed and the Germans did not succeed in crossing the narrow seas to a successful inva-

sion of England. The naval men answered that Britain was, nonetheless, paying a fearful price to air attack for her long unpreparedness and that the narrow seas would have done Britain little good had it not had a powerful navy to repel attack across those waters. Even Britain's mighty naval power was being strained to the limit, possibly dangerously beyond it, to patrol those narrow seas and also to keep its sea borne commerce moving. In short, while it was evident that the U.S. first line of defence was still naval, it was naval and not merely aqueous.

In this connection frequent reference was made to the danger of blind reliance on a broad expanse of ocean, as the French had relied, to their complete disaster, upon the Maginot line. The navy must be powerful enough to meet all possible attack, and now, what had been an extreme naval hypothesis (naval attack on both the Atlantic and the Pacific oceans) had become a live possibility and an almost avowed plan.

Numerous other phases of the U.S. naval problem arose, minor only in relation to the main issue of preserving the mainland of the United States from invasion, but each of them a problem capable of testing U.S. naval strength to the full. The more or less loosely observed codes of international law which had guided the three centuries of the modern epoch had been brazenly thrown over by the totalitarian powers, the new probable enemies of the U.S., acting in concert. There was no assurance that they would even content themselves with a formal mass invasion directly across either or both oceans, with diversions on the other. The problem of transporting a great army across the ocean, even granting German victory in Europe, was still stupendous and, by itself, could probably be frustrated by the U.S. navy, although possibly only by abandoning its far eastern interests to Japan and taking grave risks as to Hawaii, the Panama Canal Zone and the western coast of the United States.

There was also the danger that utilizing that highly co-ordinated combination of treachery, espionage, sabotage, internal subversion and political and economic corruption and blackmail, which had come to be known as the "fifth column," the enemy might establish a formidable bridgehead and base of operations on the South American continent. From Brazil to Dakar in West Africa the ocean voyage would be much shorter than across the north Atlantic, but, more important, it would be remote from U.S. air and sea bases. Here was a combined naval-military expeditionary force problem and political-economic problem very definitely related to the defence of the United States. Again, just as aid to Great Britain was regarded as the most immediately effective way of impairing the war might of Germany and Italy, so aid to China was regarded with relation to Japan. Yet, to reach either Great Britain or China with U.S. aid, control of the sea lanes was essential.

Another problem arose in the Pacific with regard to the Netherland Indies, Australia and New Zealand. Joint use with the British of the great British naval base at Singapore could add enormously to the power of the U.S. fleet in the Pacific. However, the use of that base by either British or Americans would be seriously impaired by any important Japanese advance southward into the area of French Indo-China, Thailand (Siam), the Netherland Indies or Australia. To give greater point to this peril, as 1940 closed, it became evident that German commerce raiders were operating in the Pacific and Indian oceans, probably with at least tacit Japanese aid.

It was frankly admitted by the highest U.S. naval authorities that the U.S. navy was not ready to meet all these problems. This raised the possibility of direct invasion, if not of the United States, then certainly of other areas on the American continent. This in turn brought to the fore the extent of the military establishment needed to deal with such invasions, and to furnish expeditionary forces to meet such threats elsewhere on the continent. It raised very urgently the problem of U.S. air power to play its part in repelling all such invasions anywhere on the western continent. Finally, there arose the psychological problem that defence of the U.S. might rest ultimately on ability to launch a powerful U.S. offensive.

Lack of a Co-ordinated National Defence Policy.—Recognition of these varied problems of national defence brought on a veritable high fever of reparation—raising troops, equipping them, building ships and equipping them, setting up of industrial priorities to expedite contracts for national defence matériel, raising or at least appropriating colossal sums for these

various purposes. Notwithstanding all these intensified activities, there was little evidence that the most fundamental weakness of the U.S. defence scheme was being remedied, or indeed that it was even receiving serious attention.

That fundamental weakness was the lack of a comprehensive, integrated U.S. military, naval, foreign and economic policy, and particularly the lack of a definitely constituted body charged with the sole duty of developing such a policy and keeping it effectively up-to-date, such a body as the British had in the Committee of Imperial Defence. Numberless examples of ineptitude had developed, directly traceable to the absence of such a body. The nation found itself seriously contemplating the possibility of war with Japan, arising out of conditions which had been developing over a period of from nine years to six months. Yet, for a considerable part of that time, indeed, until Japan had actually joined the axis powers in formal alliance, the United States had been permitting the shipment of substantial war material, such as pig iron, scrap iron and cotton to Japan.

A world situation which had been steadily building to the climax at which 1941 opened, and which had been developing through three years of war in Asia and nearly a year of war in Europe, found the U.S. in May of 1940 suddenly almost hysterical over the dangers arising from a possible axis victory in Europe. A foreign policy had been pursued for several years which was bound to antagonize one or more of the axis powers in Europe and Asia, while the military policy had retrograded almost to a pre-World War (1914-18) status.

With enormous naval responsibilities piling up, nothing substantial was added to the main battle line of the navy or to the essential destroyer support of that line until after the Japanese actually discarded the naval limitation treaties and laid down substantial building programs. The well known development of the German *Panzerdivisionen* was amiably ignored until the Polish and French disasters found the entire U.S. army with less mechanized equipment of all types and ages than was to be found in a single *Panzerdivision*. This was all the more remarkable in that the German staff was indebted in large measure to U.S. army studies of the use of mechanized forces in modern war for the basic ideas which the Germans developed to such perfection.

From what has been said previously, it is evident that the American military problem was pre-eminently a naval problem, and that the navy, although in far better shape than the army, was not adequate to deal with all aspects of that problem. Moreover, one of Britain's urgent needs was reinforcement of merchant marine and naval strength, especially in the destroyer and patrol vessel classes.

Yet so little had this problem been seriously dealt with that the secretary of the navy on Jan. 17, 1941 put before the Foreign Affairs committee of the house of representatives a comparative tabulation of naval strengths which showed United States combatant tonnage, as of Jan. 1, 1941, to be 1,250,000 tons, compared with a combined tonnage of Germany-Italy-Japan of 1,835,000 tons, to which the remnants of the French fleet might add 310,000 tons. These figures showed marked and increasing inferiority in numbers of battleships, cruisers and submarines and a continuing but shrinking inferiority in numbers of destroyers for the U.S. fleet, as compared with the axis fleets (excluding France) through to Jan. 1, 1943. By this time it had been found that U.S. shipyard capacity was unequal to the task of meeting the urgent demands of the navy, ordinary merchant ship requirements and the very urgent merchant ship demands of the British. Since this situation had been foreseen and publicly commented on by private observers months before, this serious handicap was reasonably chargeable to the lack of a co-ordinated defence planning program.

Faced with this great naval construction and equipment problem, with its inevitable burden on the machine tool and precision metal working branches of industry, a huge army program was launched in the early fall of 1940. A movement initiated by private patriotic groups was adopted as government policy and resulted in passage of a Selective Service act, which contemplated putting 1,400,000 men under arms by the summer of 1941. The details of this plan are dealt with under **SELECTIVE SERVICE**. But the equipment of this gigantic force threw another load on an already overburdened industry.

Numerous procurement difficulties within the army program arose immediately, of which there is space to cite only one. Two mechanized divisions were authorized by the war department, with insufficient equipment for one on hand. It was found that to supply the necessary tanks or combat cars it would be necessary to erect a factory. It was found that it would take possibly one year before that factory could be erected and equipped to begin production of the basic equipment for the mechanized divisions. Yet for years the army had been working on an industrial mobilization plan.

A similar situation arose in aircraft procurement. Whereas in May 1940 the president had spoken of 50,000 planes by Jan. 1941, production of 799 planes of military type in Dec. 1940 was being hailed as exceeding expectations. (Statement of John D. Biggers, director of production for Office of Production Management, headed by William S. Knudsen.) Mr. Biggers was unable to state how many of these represented first line combat planes, and he declined to discuss what proportion would go to Great Britain and how many to U.S. combat aviation. Woefully inadequate as the British air strength was, the effect of planning was shown in the enormous step-up in their production, notwithstanding destructive German bombing of British industrial centres.

In considerable measure this was attributed to the so-called "aircraft shadow factories," planning for which had begun as far back as 1933, the year Hitler came to power. There was no evidence to indicate any comparable U.S. planning much before the summer of 1940.

In one other respect the lack of an integrated plan was evident principally to close, technically trained observers, familiar with the propaganda techniques of modern warfare. The new so-called "fifth column" tactics of the German army had rendered striking assistance in their European

conquests, and had been defeated in England only when the eleventh hour was striking. These tactics differed in each country where used, and it was evident and known to close observers, inside and outside the U.S. armed services, that the plan for attack on the United States was adapted to strike along propaganda and economic lines.

This was outside the classic lines of war as visualized by the U.S. high command. Even if it was not so regarded, neither the army nor the navy was equipped with machinery to wage a counter to this form of attack. Yet a properly integrated policy of defence would have foreseen this development, or at least would have recognized it as soon as it appeared and set in motion a direct counterattack in defence. As it was, such effort as was made was largely the unco-ordinated, often the friction-creating work of rival legislative committees and executive departments and private agencies, all open to the suspicion of and often charged with working for ulterior political, private or propaganda purposes. This situation alone represented an actual victory on this front for the German agents, who sought primarily to confuse and break up the unity of American purpose. The question of aid to Great Britain, fundamental to the nation's major strategy, thus became a football of these internal bickerings, rather than the measured, confidence-inspiring decision of a "Committee of National Defence"—which did not exist.

American Aid to Great Britain.—More than any single phase of defence policy, this question of aid to Great Britain became a measuring rod of the extent and direction and nature of U.S. foreign and military policy. Originally arising as an admitted successor to the waning notion of neutrality in the war in Europe, it was first epitomized in the words "all aid short of war." The high point of this phase was reached when the president of the United States announced on Sept. 3, 1940 the conclusion of an agreement between the United States and the British governments whereby the latter had given to the former the right to air and naval bases in Newfoundland and Bermuda, and in exchange for 50 over-age U.S. destroyers turned over to the British, the British government had conceded to the United States government the right to additional bases in the Bahamas, in Jamaica, Saint Lucia, Trinidad and Antigua and on the South American mainland in British Guiana.

This transaction, carried out exclusively by executive action (the American congress merely being notified by the president that he had so acted), gave the British fleet a reinforcement in destroyer strength which it desperately needed for convoy and anti-submarine work. On the other hand it gave to the U.S. fleet vital bases offshore of the United States mainland and at the entrances to the Caribbean sea which enormously increased the navy's offensive and defensive powers on the Atlantic seaboard. Winston Churchill was criticized in England for having paid too high a price for the destroyers, a rather pointless criticism in view of the very serious British naval position. In the United States, even the president's critics recognized he had done well for U.S. defence and merely criticized his methods.

Great as was the strategic importance of this destroyers-for-bases deal, its significance as a milestone in U.S. policy was still greater. When the policy of aid to Great Britain went so far as to turn over 50 serviceable warships, it became very vague as to what limitation, if any, actually existed in the phrase "short of war." As has already been said, shortly after election this phrase disappeared from public discussion, except for a relatively feeble attempt to revive it in Jan. 1941 when opponents of the president's "lease-lend" policy adopted the previous formula as their own, thereby tacitly conceding victory to his view, since it now represented a considerable recession from their own original view of absolute neutrality.

NEW 155-MM. FIELD GUN, given its first trial by the U.S. army in 1940. It fires a 95-lb. shell 26,000 yards

The bigger question arose—how far shall aid to Great Britain go, in light of United States defence needs? The president ordered that the production of United States aeroplane factories be liberally shared with British—no exact formula was ever officially published. But the United States needed great accessions to both its air force and its own navy. Those favouring liberal aid argued that the British were now fighting a common enemy; made strong enough they might defeat that enemy without imperilling the United States or engaging her armed forces. Implicit in this view was the premise that Great Britain could defeat Germany, might not. In that eventuality, even extending to a British disaster, the United States might have to fight the entire axis strength dominating the rest of the world. Then every ship and plane would be of vital importance to the United States.

Naturally this last argument led its proponents to the conclusion that should be carefully rationed. Unfortunately, a realistic view strongly suggested that this line of reasoning, like the theory that the United States should give aid which "did not inevitably lead to war," would be likely to result in British defeat and thereby leave the United States facing all the alternatives of accepting hostile axis domination of the world or with the axis powers. The really practical problem appeared to be: How much aid could the U.S. afford to give Great Britain, recognizing that every month of assistance enabling it to prolong its fight both injured the enemy and gained very much needed time for building up U.S. defences to a point where the United States could risk collision with the axis with reasonable chance of victory?

Obviously this problem involved several constantly shifting variables, each acting on the other factors in the problem and changing their value in the equation. It was a problem which could not be solved categorically or definitively and most certainly could not be solved by a *priori* discussion. It was, in short, a problem of high policy and therefore one of judgment constantly adapting itself to the changing exigencies of the situation.

Only one element emerged with reasonable clarity and secured virtually unanimous support—the United States must carry all its preparations for war to the full extent of its resources by sea, air and land, in industry in morale, even to the extent of being ready to wage powerful aggressive war as the surest ultimate defence. This was being done.

Development of American Naval Strength and Policy.—Although the annual budget presented to the congress at the beginning of 1940 included \$1,800,000,000 for defence purposes out of a total proposed expenditure of \$8,400,000,000, a defence budget which was quite heavy for peacetime, the real upturn in defence items did not begin until May. During the month of May the congress authorized or appropriated a total of more than \$5,000,000,000. By July these figures were virtually doubled.

The authorizations, as distinct from appropriations, looked to future growth beyond the fiscal year 1940–41, and this was particularly true of the navy, the programs for which contemplated building extending over a six-year period. It having been recognized that the navy, in the event of British defeat, might be called on simultaneously to meet aggregate forces exceeding its own strength in both oceans, a "two-ocean" navy was authorized. Under this concept the navy would no longer have to rely tacitly on British support to control the Atlantic, while it devoted itself mainly to the Pacific; nor would it matter so vitally if some attack on the Panama canal prevented rapid transfer of the fleet from one ocean to meet attack in the other. The theory of the "two-ocean" navy was that this fleet could permanently maintain in each ocean a force adequate to meet an anticipated attack in that ocean.

To attain this new ideal of a two-ocean navy, a 70% increase above strength hitherto contemplated was authorized. As this included building of a number of large battleships, as well as the appropriate

ighter vessels, increase in the air force and in shore establishments to service such a fleet, the authorizations covered items some of which would take until 1946 to complete.

Early in Jan. 1941 two other announcements showed the energy with which the navy was addressing itself to immediate plans and efforts to increase its fighting strength. It was announced that the enlisted personnel of the navy would be increased to 232,000 men, an increase of approximately 22%. It was also announced that the navy was being reorganized into three fleets—Atlantic, Pacific and Asiatic. The last named indicated the beginning of definite plans to meet anticipated Japanese southward aggression toward Singapore and the islands of Netherlands India—an almost revolutionary step in U.S. naval thinking.

In his budget message accompanying the budget submitted to the congress for the fiscal year beginning July 1, 1941, the president spoke of the \$10,811,000,000 as only part of a three-year program, in the course of which total naval expenditures were expected to reach \$11,587,000,000, quite aside from nearly \$3,200,000,000 set aside for increasing industrial plants to take care of increased defence needs.

By Jan. 1941 it was estimated that 21 new warships and a much greater number of auxiliaries had been added to the fleet, and that approximately one fighting ship was being delivered every 12 days.

Ships take time, a great deal of time, to build, and it also takes considerable time to train naval crews adequately to their multifarious and highly technical duties. But battle fleets require more than ships, guns and men. They also require bases from which to operate, and the far-flung system of naval bases girdling the world was one of the greatest elements of strength available to the British fleet. A considerable step in building up the U.S. navy was taken by the acquisition of lease and other rights to bases on British territory in the western hemisphere, already discussed in connection with the delivery of 50 American over-age destroyers to the British. Other negotiations were undertaken with various South American nations looking to the availability of suitable air and sea bases of operation on that part of the western continent. While progress was apparently made, up to Jan. 1941 no official confirmation was made available regarding the progress of such negotiations.

Development of American Army Strength and Policy.—By its nature the army was much more susceptible of rapid expansion, clearly evident and close to the citizens of the republic than was the navy. While the army was undergoing an expansion which seemed to be somewhat out of line with its probable immediate responsibilities, it is entirely possible that the president saw in the continuing expansion of this side of the nation's armed forces the means of keeping public attention focused on the defence problem, from which it might have been distracted if left only the comparatively technical and slow-moving naval development to watch.

Whatever reasons of high state policy might have played their part in the decision, the U.S. army was undergoing a tremendous expansion in numbers and equipment, although the greater part of the actual increase in size was planned for 1941. The outstanding change in the army picture was the passage of the Selective Service act. While a somewhat similar act had been in force in the United States in 1917, the nation was then formally at war. This was the first time a conscription measure was in force in the United States during a period of nominal peace. The increase in the man power of the army was, however, in part due to volunteers. In June 1940 the army strength stood at about 240,000. Six months later the number had risen to approximately 600,000.

Camps and cantonments to accommodate a force of 1,400,000 men were well advanced toward completion. During the six months the number of new Garand semi-automatic rifles increased from about 40,000 to over 100,000. The step-up in production of these rifles was beginning to exceed the best early hopes. The internal system of army administration was undergoing considerable revamping, both to take care of the large numbers of new soldiers coming to the colours and also to permit actual modern battle training for large bodies of troops, such as had not been seen together in this country since 1918. The nine corps areas were assuming their wartime function of administration, procurement and recruiting, while the tactical training was being taken over by the four armies, which had previously been largely paper organizations erected upon groups of corps areas.

Air Force Policies and Development and Industrial Production.—At the beginning of the year 1940 it was stated that the army had almost as many aircraft equal to the warplanes of the warring nations in Europe. By the year's end it was estimated that the army had about 500 first-line planes, besides several times this number of obsolescent and training type planes. About 400 planes had been added to the navy and marine corps aviation, bringing it to a total of approximately 2,500 planes. Of course these numbers were relatively insignificant by comparison with the forces in service in Europe.

The American increase would have been much greater had it not been for the considerable part of U.S. production which was diverted to supplying the British needs. And this, in turn, drew attention to the whole industrial production set-up. The president called to Washington a commission of outstanding industrial leaders to co-ordinate production. This group was, however, advisory and without authority. There still prevailed, even in this one phase of the national defence, that marked reluctance to a centralized co-ordinated plan which has been previously spoken of as the major defect of the U.S. defence set-up. By November it was becoming painfully evident that this commission, in spite of heroic labours by its members, was not getting production.

The president at the beginning of 1941 set up a new Office of Production Management under the co-directorship of William S. Knudsen, formerly president of General Motors corporation, and Sidney Hillman, an outstanding labour leader. The magnitude of the industrial task was indicated by the fact that, over and beyond writing into the internal revenue acts certain provisions for the amortization and depreciation of equipment used in filling national defence contracts, the government also made provision for directly financing the construction of industrial plants in

which to manufacture the equipment needed by the armed forces. It was estimated that the government's direct investments of this nature might total \$3,000,000,000 before the emergency was under control.

In the industrial end of the problem appeared the first glimmer of hope of co-ordinated organization. It was felt that industry and labour, even at the opening of 1941, were still imbued with the "business as usual" viewpoint. But the ceaseless pressure of the Office of Production Management (OPM) began to undermine this easy complacency. The absolute shortage of industrial equipment to fill all the orders of all the armed services and of the British, made imperative some form of centralization, of priorities control and of rationing production capacity. Inevitably this required some formulation of a comprehensive plan and policy. As 1941 opened and the nation was plunged into debate over the president's sweeping proposals for almost unlimited executive authority over the nation's war effort in every field to be vested in the president, the idea of a co-ordinated plan was securing tact, vague, but increasing recognition. Out of the urgent necessities of *de facto* war, through the industrial back door to the theatre of war, the idea of a co-ordinating authority was slowly taking shape. It was too late to make it function economically; there was still time, but not much time, to put it in sufficient shape to function effectively. De Gaulle, Charles: see GAULLE, CHARLES DE.

Delaware, one of the 13 original states, popularly called the "Diamond state." Area, 2,399.2 sq.mi. (land, 1,961.7; water, 437.5). Population (1940), 266,505. Capital, Dover, 5,517. The only larger city is Wilmington, 112,504. Public school attendance (Sept. 1940), 41,849.

History.—In the November elections 51.1% (fourth highest in nation) of Delawareans voted. Roosevelt, 74,599; Willkie, 61,390. The third-term candidate, with a big lead in Wilmington, smaller (about 10%) pluralities elsewhere in the state, carried the Democratic congressional nominees and all state administrative officers, except governor, with him to victory. James M. Tunnell, Sr., and Dr. Philip A. Traynor displaced Republican Senator John G. Townsend, Jr., and Representative George S. Williams (pluralities, 4,495, 3,821). With hold-over Senator James H. Hughes, Delaware's

GOVERNOR WALTER W. BACON of Delaware, elected Nov. 5, 1940 on the Republican ticket

Washington delegation became wholly Democratic for the first time since 1919. However, the Republicans retained control of the state legislature (senate 10-7, house 21-14) and recaptured the governorship. Popular Democratic Governor Richard S. McMullen, slated to succeed himself, was compelled by poor health to withdraw on the eve of the election. His successor, youthful Secretary of State Josiah Marvel, Jr., was snowed under by Republican Mayor of Wilmington, Walter W. Bacon (70,809 to 61,276). The Democrats elected Isaac J. MacCollum lieutenant governor by 656 plurality, other state offices by safer margins. A last-minute Liberal Democratic ticket polled 2,000 to 3,000 votes.

A \$1,500,000 addition to the Delaware hospital, Wilmington, was completed in December. The second unit in the hospital's \$3,500,000 building program was under construction; the third will be begun in 1941. In December the Biochemical Research foundation of the Franklin institute (Philadelphia) moved into new quarters adjoining the university campus in Newark. Equipment (including cyclotron) and building were valued at \$500,000. The federal food stamp plan for the distribution of surplus commodities was inaugurated in New Castle county in November.

Headquarters of the U.S. 2nd army corps were established in Wilmington in December.

Industries.—National defence spending added impetus to the general improvement in Delaware business in 1940. In November employment was up 6.6%, payrolls 13.9%, over Nov. 1939. In Wilmington, building permits for 1940 totalled \$6,698,334 (1939, \$5,470,655). General business was better in 1940 than in 1929, according to Babson, who at the year's end called the Delaware metropolis "one of the most prosperous cities of the country." Principal Delaware crops were estimated at \$10,836,000, 13% above 1939. Higher yields offset lower prices. Delaware, with 0.2% of the nation's population, paid 1.5% of the federal tax bill for the fiscal year 1940. Average per capita income (1939) was \$848, highest in the country (New York, \$825, second; national average, \$536). Of Delaware personal income, invested capital contributed 39% (national average was 16%). For the fiscal year 1939 federal tax collections averaged \$275 per capita, expenditures \$26.

Democracy is not only a technique of government, based upon freely elected representative institutions and upon an executive responsible to the people; it is based upon the belief in the equality of all individuals and in their equal right to life, liberty (including the liberty of thought and expression) and the pursuit of happiness. The denial of this equality and of individual liberty, the proclamation of authoritarianism and of the inequality of men and races as a "new order," is characteristic of fascism, which arose as a conscious and aggressive world-wide opponent of democracy, bent upon its destruction.

The events of the war in 1940 brought with them the occupation and the defeat of five of the leading European democracies: Denmark, Norway, the Netherlands, Belgium and France. In all these five countries fascism replaced democracy, at least outwardly; most of the inhabitants of Norway and the Netherlands and the legitimate governments of those two countries clung firmly to their democratic principles and looked forward to a defeat of the fascist powers as their only hope of regaining liberty. The same may be said for the majority of the people in Denmark, in Belgium and even in France, although there the defeat and the ensuing chaos were used by a group of reactionary and antidemocratic politicians and generals to establish a semi-fascist regime and to abolish the democratic institutions of the French republic.

In the two remaining democracies on the European continent, the spirit of democratic resistance was rather strengthened by the events of the war. The parliamentary elections held in Sweden on Sept. 15, 1940, bore that out clearly. As compared with the last elections in 1936, the new elections proved a definite trend toward more democracy. The National Socialists who in 1936 had received 26,750 votes, too few to get a seat, did not participate at all in the 1940 elections. The Communists received only three instead of the five seats of the former elections, while the largest democratic party, the Social Democrats, gained for the first time the absolute majority in parliament and could increase the number of its seats from 112 to 134. On the other hand, the Conservatives lost two seats, the Liberals four and the Agrarians eight. Thus the election strengthened the Social

Democratic government. There were no elections in Switzerland but an interesting indication of the strength of democracy afforded in the general protest movement in parliament, in press and among the people against the audience which the federal president had granted to the representatives of the "National Movement," a Swiss National Socialist group. The federal council was obliged to stress the will of resistance of the Swiss government to any encroachment on Swiss democracy. A short while later, when the National Movement presented an ultimatum to the federal government, demanding recognition and permission to publish fascist papers, the government not only refused the demand but dissolved the movement and threatened its leaders with imprisonment.

On the whole, fascist and communist attacks against democracy led to a reappraisal and a reassertion of the fundamental attitudes and truth inherent in the democratic position. This became especially clear when the democratic peoples learned to appreciate after the fall of France, the whole military power of the fascist countries and began to realize the danger to their existence implicit in a German victory. A new will to democratic action animated the British and the American peoples. The heroic stand taken by the British after May 1940, under the government of Winston Churchill and of the British Labour party, the international democratization of the spirit and forms of British life which the war brought with it, acted as an inspiration to democratic faith and hopes everywhere. In the United States people began to understand the seriousness of the life-and-death struggle in which democracy found itself, against a world-wide attempt to impose fascist domination. Public opinion swung rapidly to demands for a total defence of the democratic institutions of the United States and for all aid to Great Britain short of war. Both great political parties and their leaders made these demands part of their program. The formation of an alliance of the three great fascist powers, Germany, Italy and Japan, which was openly aimed at the United States, hastened the realization by the American people of the fact that only a united stand of the democracies could stem the tide of fascist aggression. Various proposals for a federation of the democracies and for the establishment of systems of mutual assistance for the preservation of international order were put forward and gained large numbers of adherents. A new will became manifest, to apply democracy to the international field, to overcome national egotism and thus not only make peace possible but to make democracy secure internally. The conquest of Norway, of the Netherlands, of Belgium and France revealed the existence of well-organized pro-fascist groups in those countries, the so-called "fifth columns," which undermined the will to resistance of the democracies, helped to spread mental and moral confusion about the issues of the war and sabotaged national defence. The clear revelation of the existence of these groups focused the attention of the remaining democracies upon the danger from within, and with increased vigilance necessary steps were taken to combat this danger.

This growth of democratic awareness made itself felt also in Latin America. The strong stand taken by the United States for the defence of democracy and especially the continuance of British resistance to fascist aggression influenced many of the vacillating elements in the Latin-American republics and convinced them of the strength of democracy. With the unexpected vigour of British defence and the courageous stand taken by the Greeks as an example, the Latin-American governments were ready to co-operate with the United States in the common defence of the western hemisphere, not only against external aggression but also against internal disintegrating anti-democratic forces. Mexico and Uruguay, especially threatened by fascist intrigues, came closest to full co-operation with the United States. (See also

Democratic Party. As 1940 opened, the Democratic party continued in control of the executive and legislative branches of the national government. When the 76th congress convened for its third session on Jan. 3, the Democrats held 69 senate and 261 house seats. Postmaster General James A. Farley remained as chairman of the Democratic National committee. In the house, William B. Bankhead of Alabama held office as speaker, with Representative Sam Rayburn of Texas as floor leader. Senator Alben W. Barkley of Kentucky continued as Democratic senate leader.

The war emergency greatly strengthened the president's leadership in congress. In 1939, reflecting the conservative trend of the 1938 elections, many Democrats in congress showed a more critical attitude toward the New Deal. National defence, and the European war, dominated the proceedings in congress in 1940. Though the Democrats were still sharply divided on many domestic issues, the president easily secured enactment of his defence measures. The administration proposed little new social legislation of importance.

Though the president remained silent as to his 1940 intentions, the third term question was much discussed by Democratic leaders. Many high administration officials urged that the president be drafted for another term. Other Democrats let it be known that they would oppose a third term.

DEMONSTRATION for President Roosevelt during the historic third-term convention of the Democratic party at Chicago in July 1940

The Election.—On Feb. 5, under call of Chairman Farley, the Democratic National committee met in Washington, and authorized Chairman Farley and a small committee to fix the date of the national convention and select the convention city. In accordance with this authority, Chairman Farley later issued a call for the Democrats to meet at Chicago, on July 16.

Regardless of Mr. Roosevelt's plans, Vice-President John Garner announced that his name would go before the convention. In the Illinois primaries on April 9, the president defeated Mr. Garner by a majority of approximately 6 to 1. Postmaster General Farley, another aspirant for the nomination, permitted the use of his name in the Massachusetts primaries. By the end of May, however, it was plain that the president could have his party's nomination, if he would accept it.

On June 20, the president nominated Frank Knox and Henry L. Stimson, Republicans, to be secretary of the navy and secretary of war respectively. The nominations came under immediate attack in the senate. Democratic "isolationists" charged that Stimson and Knox both favoured United States intervention in the European war. Republicans asserted that the appointments had converted the Democratic party into a "war party." Both nominations were confirmed, that of Stimson on July 9, by a vote of 56 to 28, and that of Knox, the following day, by 66 to 16.

Speaker Bankhead, as temporary chairman, delivered the keynote address at the Democratic National convention. Senator Alben W. Barkley served as permanent chairman. On July 18, President Roosevelt was renominated on the first ballot for a third term. By a vote of 628 the convention selected Secretary of Agriculture Wallace as his running mate; Speaker Bankhead received 329 votes, and Paul V. McNutt, 67 votes. Both were candidates for the vice-presidential nomination. Postmaster General Farley, who had been placed in nomination at the convention by Senator Carter Glass of Virginia, resigned as chairman of the

Democratic National committee in August and the president announced the appointment as his successor of Edward J. Flynn of New York. Democratic national headquarters were moved for the duration of the campaign from Washington to New York.

On Nov. 5, President Roosevelt was re-elected by 449 electoral votes to 82 for the Republican candidate, Wendell L. Willkie. Though the Democrats lost five senate seats, they increased their representation in the house.

On Sept. 15, Speaker William B. Bankhead died. The following day Representative Sam Rayburn of Texas was elected to the speakership, and on Sept. 25, a Democratic caucus chose Representative John W. McCormack of Massachusetts to succeed Mr. Rayburn as majority leader of the house. Senator Key Pittman of Nevada, chairman of the Senate Foreign Relations committee died on Nov. 10. He was succeeded as chairman by Senator Walter F. George of Georgia.

Though administration leaders pressed for a *sine die* adjournment, their efforts were blocked by the Republican minorities in congress, and the 76th congress remained technically in session through the calendar year 1940. On Dec. 29, Mr. Roosevelt made a radio address, in which he announced that the United States would become "the arsenal of democracy." As the year closed, there was every indication that the president, in his program of aid to Britain, China and Greece, could confidently count on the support of most Democrats in Congress. (O. McK.)

Deneen, Charles Samuel (1863-1940), former senator from Illinois, was born in Edwardsville, Ill., May 4, and was graduated from McKendree college in 1882. He was admitted to the bar in 1886 and practised in Chicago from 1890 to 1904 when he was elected governor of Illinois, serving two terms. He returned to the law at the expiration of his second term. He was appointed to the United States senate in 1925 to fill out the term of the late Medill McCormick and was elected to a full term, and at its expiration again resumed practice. He was active in reform movements in Chicago and while governor he brought about the passage of a presidential preference primary law. In 1912 he favoured the nomination of Theodore Roosevelt to the presidency by the Republican convention, but supported the regular nominee of the party. While in the senate he fought unsuccessfully to seat Frank L. Smith who had been elected but was charged with receiving campaign contributions from improper sources. He was also active in the movement which defeated the organization controlled by Governor Len Small, Mayor William Hale Thompson of Chicago and State's Attorney Robert E. Crowe. He died in Chicago, Feb. 5.

Denmark. A democratic monarchy in northern Europe; capital, Copenhagen; king, Christian X; prime minister, Th. Stauning. Area, 16,575 sq.mi.; population (official est., 1939) 3,805,000. Chief towns (1935): Copenhagen (843,168); Aarhus (90,898); Odense (78,403); Aalborg (48,132).

History.—As the year 1940 opened, Denmark was carefully steering a neutral course, hoping that her innocence and her economic value to both the chief belligerents might spare her from invasion. But in the early morning of April 9 the German bombers flew over Copenhagen and troops entered the city and crossed the frontier in Jutland. The government validated a decision really made long before and ordered submission; there was very little bloodshed. The Germans were anxious to gain co-operation from the Danes and treated the population perhaps as well as an occupying army can treat a conquered people. After an attempt to force acceptance of German money, for example, they yielded to the Danish opposition and began using Danish money; and Danish flags continued to fly. Increased trade with Germany was

FEW PHOTOGRAPHS of the German occupation of Denmark in April 1940 were released by the Nazis during the year. This one shows two German officers conferring in the square of a Danish city.

necessitated by the very circumstances of the war more than 1 military demands; Denmark sent vast quantities of pork, butter, eggs, into hungry Germany, in return for promises of coal and machines—much of which could not be delivered on account of transportation difficulties in the reich. No trade at all could be conducted with Denmark's chief customer, Great Britain.

The resentment of the Danes against Germany manifested itself in a deepened national feeling. For King Christian's 70th birthday (Sept. 26) they made a large national subscription (which was turned over to charity), and hundreds of thousands greeted him in the streets of Copenhagen. On the first of September a nationwide community song-fest brought the people emotionally together. Occasionally outbreaks of violence (such as that at Haderslev in South Jutland on Dec. 9) showed that the nazis were not having an easy time. Behind the emotional patriotism of the Danes lay a steady rise in unemployment and a skyrocketing of prices to 150% and even 200% of prewar levels. And there lay behind it, too, a sense of injustice suffered merely because the country was small and other countries were at war.

Finances and Banking.—Budget estimates, 1939-40: revenue 607,245,000 kroner; expenditures 622,547,000 kroner; 1940-41: revenue 607,035,000 kroner; expenditures 655,764,000 kroner. The public debt (1939) was 1,229,141,000 kroner. The krone, no longer quoted on free exchanges, is normally worth about 25-26 cents.

Trade and Communication.—External trade (merchandise) imports (1939) 1,740,347,000 kroner; exports 1,577,973,000 kroner. Price index (based on 100 for 1935): Jan. to Oct. 1939 114; Jan. to Oct. 1940, 168.

Agriculture and Industry.—The table is given as a sample of what the war in 1940 was doing to Danish economy—meat production up, for lack of fodder; milk production down, for lack of cows.

Production of Animal Products in Denmark

Dentistry. The year 1940 marked the 100th anniversary of the founding of dentistry as a profession, through the establishment of the first dental school, the first dental magazine and the first dental association. This anniversary was celebrated in Baltimore, Md., under the joint sponsorship of the American Dental association, the Maryland Dental association and the University of Maryland. The first dental school to be established was the Baltimore College of Dental Surgery, now a department of the University of Maryland.

One of the outstanding developments in 1940 was the announcement by Harvard university of the starting of an entirely new plan of dental education. The object of the new plan is to train dentists who, besides receiving technical preparation in dentistry, would also have a sound biological and medical preparation, and consequently be better prepared to advance knowledge in dentistry and to meet the growing need for men equipped to play a useful role on the attack of dental problems in their relation to the public health.

X-Rays.—In the rapid development of the X-ray for diagnosis in dentistry, it was evident that some of its dangers were overlooked, through possibly familiar and wide use of this diagnostic procedure.

Plastics.—One of the outstanding developments in industry generally in 1940 was the rapid development of plastics for various uses. Dentistry has made use of the plastics in the denture field, plastics being used as a base material. Two papers, "A Century of Progress in Denture Base Materials," and "Non-Metallic Denture Materials—Their Development and Relative Merits," dealt intensively with this subject. Acrylic resins were being widely used, for they have many of the essentials of a satisfactory denture base material. Patents were closely held by certain concerns, which made the matter somewhat difficult for the dental profession.

Allergy.—Allergy in 1940 seemed to be attracting considerable attention in the field of medico-dental problems. This aspect of the dental problem was developed by a paper entitled, "The Role of Allergy in Medico-Dental Problems." Allergic reactions to substances used in dentistry were discussed, including denture base material, various types of local anaesthetics and various drugs used in the treatment of teeth. Focal infection and bacterial allergy, and malnutrition in allergic persons, were also well covered.

Operative Dentistry.—In the field of operative dentistry an attempt was made by one author to evaluate developments in operative dentistry, in which the author brought out the importance of studying the medical aspects of the dental problem before proceeding to do the reparative work ordinarily done by dentists.

Fluorine and Dental Caries.—In research in dental caries the role of fluorine in the prevention of tooth decay was one of the chief subjects of discussion during 1940. It has been known for a long time that fluorine in drinking water is the cause of mottled enamel, but investigations have suggested that a small quantity of fluorine in the drinking water serves as a protection against dental caries. In the state of Illinois this matter was particularly studied, and the incidence of dental caries in children was studied in four cities—Monmouth, Macomb, Quincy and Galesburg. "These cities are similar in their geographical and economic status, but differ in their water supplies." "Macomb and Quincy have 0.2 p.p.m. of fluorides in their water, whereas Galesburg and Monmouth have 1.7 p.p.m. fluorides. In the cities where the water had a low fluorine content, the incidence of caries is four and six, respectively, for a child. In the two cities whose water has high fluorine content, each child has on the average but two cavities." This rather startling report and the attention given some of this material by the press resulted in false impressions regarding the possibilities of fluorine as a preventive. The studies were of significance, but it was, of course, too early to make it possible to apply widely any therapeutic measures involving the use of fluorides to prevent caries.

Chemotherapy.—The widespread use of sulphanilamide in its various derivatives naturally interested the dental profession. Dentists began to use some of the derivatives of sulphanilamide in local lesions within the mouth. There was no evidence, however, that this method of use of this type of drug has any such profound effect as its internal administration.

Vitamins.—One of the interesting developments in the vitamin field of dentistry during 1940 was an increasing use of nicotinic acid for certain tongue difficulties which have suggested the possibility of subclinical pellagra. Just as vitamin C has proved to be of use in certain lesions in the gum which have been associated with a low vitamin C blood level and subclinical scurvy, so a deficiency of nicotinic acid seems also to have effect within the mouth, particularly on the tongue. Studies were going on of the effect of this useful method of treatment.

Books.—Probably the book most widely discussed, both by dentists and physicians, was that by Weston A. Price, entitled *Nutrition and Physical Degeneration*.

From the evidence presented, it is clear that in 1940 dentistry definitely shook off the shackles of mechanical therapy, and that this form of treatment would be the servant of dentistry rather than its master.

Dermatology. Stokes called attention to the psychosomatic factors and their relation to cutaneous disorders. The mechanism of emotional stress and the overproduction of acetylcholine with the resulting "intoxication" was linked with many diseases of the skin. It is against this "must-be-doing" personality that therapy is directed. The interaction of emotional and allergic factors and the infection-allergic complexes often makes a "cart and horse" interpretation difficult. The classification of psychosomatic diseases includes the erythema-urticaria group, the angioneuroses, vagus sympathetic imbalance (which embraces the eczema-asthma-hay fever group, prurigo and hyperhidrotic dermatoses) and, finally, a non-classifiable group (including psoriasis, lichen planus and warts).

The use of histaminase in atopic dermatitis, urticaria, hypersensitivity to chemical and physical agents and eczema produced indifferent results. Many of the hopeful reports which demonstrated the ability of this agent to "detoxify histamine" were not substantiated. There was some evidence, however, that histaminase is of value in light sensitivity.

The cheilosis associated with pellagra was shown to be due to the lack of vitamin B₂ (riboflavin) and responds to oral administration of that substance. In addition to well recognized deficiency diseases, Andrews pointed out the importance of nutritional deficiency in predisposing to other cutaneous diseases not directly related to avitaminosis. This may be true of many of the hyperkeratotic dermatoses. Forsyth used thiamin chloride successfully in the treatment of pink disease (acrodermia). The average daily requirement of vitamin B₁ for an adult is about 300 international units. In the treatment of acrodermia it was found that 600 units a day by mouth caused gradual improvement and finally complete recovery. More rapid response was obtained by the subcutaneous injection of 2,000 units a day.

It was not yet clear whether acrodermia is primarily a deficiency disease or whether it is due to a virus which develops in the peripheral nervous system rendered susceptible by lack of Vitamin B₁.

An unusual series of 26 cases of benign chronic pemphigus occurring in three families constituted what is probably a distinct familial form of pemphigus. Meleney reported the successful treatment of chronic undermining burrowing ulcers with the combined use of zinc peroxide and sulphanilamide. Belote reviewed the literature and presented a case pointing out that necrobiosis lipoidica diabetorum may be present without diabetes. Ketrin, in a review of the literature, found that 25% of all the cases of periarthritis nodosa exhibited some form of cutaneous manifestation. Cummer and La Rocco studied sickle cell anaemia, finding the sickle cell trait to be limited almost exclusively to Negroes, to be familial and apparently hereditary. Illustrative cases with chronic ulcers of the legs were reported. A careful review showed that sulphanilamide is of definite value in erysipelas, erythema multiforme, impetigo contagiosa, acute disseminate lupus erythematosus, chancre and streptococcal lymphangitis.

O'Leary and Waisman studied 40 cases of dermatomyositis (primary polymyositis). This rare syndrome presents a difficult problem for both diagnosis and treatment. From a dermatologic point of view, the manifestations are variable and include erythema, oedema, pigmentation, sclerosis, atrophy, lupus erythematosus-like efflorescences, and lesions of poikiloderma atrophicum vasculare. There is usually a high febrile reaction and in nearly all the cases abnormal creatine metabolism is observed. Treatment by the use of vaccines, aminoacetic acid, sulphanilamide, physical therapy and artificial fever therapy have been suggested. In their series, half of the patients observed died.

An unusual series of 20 cases of leukoderma of occupational origin was reported by Oliver, Schwartz and Warren. The disease occurred in men employed at a tannery, who wore heavy rubber gloves. The cause was found to be an antioxidant added to the rubber to improve its ageing properties.

In spite of their great value, the drugs of the sulphonamide series invariably gave rise to cutaneous reactions of a greater or lesser degree. Long reported that 1.6% of adults and 3% of children showed a dermatitis following sulphanilamide; Blake reported that 10% of patients receiving sulphapyridine in the treatment of pneumonia, developed some form of cutaneous reaction to the drug. In a group of 78 patients receiving sulphathiazole, Haviland and Long reported 10 (12.8%) who developed various types of rashes, including those of urticarial, erythema-nodosum-like and morbilliform type. In addition, injection of the sclera and

conjunctiva was noted, this type of reaction not being observed in eruptions due to other members of the sulphonamide group. (See also MEDICINE.)

De Schweinitz, Paul (1863-1940), one of the six bishops of the Moravian church in the United States, was born in Salem, N. C., March 16. He was a descendant of Count Ludwig von Zinzendorf, who founded Bethlehem, Pa., and introduced the Moravian church into America. He was educated in the Moravian College and Theological seminary and ordained in 1886 after studying at the University of Halle. He served as a home missionary in Minnesota, as pastor of the Moravian church at Nazareth, Pa., and later held offices in the church organization. He was consecrated a bishop in 1937. He died in Bethlehem, Feb. 8.

Destroyers: see NAVIES OF THE WORLD; NEUTRALITY.

Detroit, in Wayne county, in southeastern Michigan, and on the Detroit river, the metropolis of the state, and the fourth city in the United States; area, 139.6 sq.mi.; population (U.S. census, 1940) 1,623,452. Foreign-born, about 400,000. Canadian and British predominate, greatly exceeding in numbers the Polish group, which is second in importance. Assessed value, \$2,413,180,400; gross bonded debt as of Jan. 1, 1941, \$359,159,688 which includes \$98,951,739 of self-supporting utility debt; gross city appropriation, \$137,353,529, including utilities; tax levy, \$67,759,692; tax rate for city and school purposes, \$28.08.

During 1940 union contracts were negotiated with all of the major automobile plants (except Ford) without serious difficulty, and labour difficulties were at a minimum as compared with previous years. The automobile workers' union had not in 1940 succeeded in securing an election in the Detroit plant of the Ford Motor company.

During 1940 the Detroit area made the most marked recovery of any county in the country, and the defence program brought industrial activity to a new high. New plants were being erected by both Packard and Chrysler, and Ford and other manufacturers received large army orders.

The influx of new workers created a shortage of low-priced housing with a resulting resurgence of building construction. It is expected that these conditions will be aggravated as the defence program gets under way.

By the close of 1940, industrial activity had not affected the relief situation as much as might have been expected. Approximately 15,000 families were on whole or partial relief as compared with 19,000 during the previous year and 24,000 on WPA as compared with 30,000. It was believed that this latter group would be rigidly reduced.

During the year, the administration of the city was affected by charges of corruption within the police department which resulted in the indictment of some 200 officials, policemen and civilians. The numerous cases had not been tried in 1940.

Increased tax collections plus effective restrictions on increase in city expenditures greatly improved the city's financial situation. Detroit was the largest American city to default on its

debt during the depth of the depression and a considerable operating deficit accrued during the succeeding years. During 1940, however, a substantial portion of the debt was refunded with corresponding reductions in interest charges and the current deficit was reduced to \$11,000,000 from a previous \$15,000,000.

In the civic field the year was marked by charter amendment placing the last remaining groups of city employees under city service, the opening of a modern sewage disposal plant, completion of important street widenings by state authorities with the city and the announcement of plans for a large medical centre to be established by private funds as a part of the college of medicine of the municipally operated Wayne university. Also city authorities concerned themselves with the rehabilitation of the large blighted area surrounding the business section and contemplated experiments with limited dividend housing.

(L. D. U.)

De Tucić, Serge (1873-1940), Croatian playwright, was born in Pozega, Croatia, later Yugoslavia. After working as a sculptor for a short time he began to write for the theatre. His play *Truly Dom* (1896) was translated into several languages and was widely produced in southern Europe. In 1904 King Ferdinand of Bulgaria made him the first director of the National theatre in Sofia. During the World War 1914-18 he went to London, where in 1914 he published a book on the Slav nations and later wrote a play, *The Liberators*, produced under the sponsorship of George Bernard Shaw and M. Wickham Steed. He was for two years professor of Slavonic languages in Kings college, London. In 1918 he went to the United States. He died in New York city, Sept. 25.

Diabetes. Diabetes ranked ninth as a cause of death in the United States in 1938 (eighth, if premature births be excluded) with a mortality per 100,000 of 23.8, the highest yet attained. In the state of New York the rate was 34.9 (1934) and for the city of New York the estimated rate for 1939 was 38.8 per 100,000. Comparing the periods 1898-1914 with 1934-40 in one large clinic, the average age at death rose from 44.5 to 64.8 years and the duration of the diabetes from 4.9 to 12.5 years. In the same clinic the expectancy of life, as calculated by the statistical department of the Metropolitan Life Insurance company, has become quite uniform for all ages, two-thirds of that of white persons in the United States. The number of diabetics living in the United States in 1940 probably reached 700,000 based upon the National Health survey of 1935-36. The table shows the ratio of diabetics in the population according to age and sex.

Ratio of Diabetics in the General Population, U.S.A.

Age	Males	Females
0-14	1:2,500	1:2,500
15-24	1:1,700	1:1,700
25-34	1:1,100	1: 900
35-44	1: 500	1: 300
45-54	1: 225	1: 125
55-64	1: 100	1: 50
65 and over	1: 70	1: 45

The above data are based upon 9,182 diabetics in an (urban) population of 2,502,391 persons. *National Health Survey.*

Diabetes is universal in distribution. The extraordinarily low mortality reported in Arizona of 10, and the high mortality in Rhode Island of 42 per 100,000 are explainable. Age and sex adjustments account for a part of the diversity, but differences in density of population, 3.8 versus 644 per sq.mi., as well as differences in race are important factors. In Arizona 10% of the population are Indians, 26% Mexicans and only about 0.5% are Jews. A survey conducted by the writer in co-operation with

the board of health and physicians in Arizona early in 1940 disclosed that (1) whereas Jews made up 0.5% of the population, they constituted 2.0% of the diabetics; (2) the disease was as common in the Indians as in the population as a whole; (3) fully as many or more diabetics were found in the prison and mental hospital as would be expected in the east and (4) diabetes was acknowledged by 1 in 42 doctors reporting in Arizona as compared with 1 in 35 doctors in Rhode Island. The opinion was expressed that throughout the world, "the incidence of diabetes is highest where (1) the average age is the oldest; (2) women predominate; (3) obesity is most frequent; (4) the proportion of Jews is greatest; (5) medical supervision is closest and (6) deaths are most accurately reported."

Arteriosclerotic causes of death have risen from 17.5% to 60.1% as diabetic coma has fallen during the same period from 63.8% to 3.6% among 5,669 deaths reported from one clinic between 1898 and 1940. But the significant fact disclosed is that deaths due to gangrene, *i.e.*, arteriosclerosis of the legs, have dropped in this interval despite three times the length of exposure to gangrene due to the increasing duration of the disease and the ageing of the average diabetic by 20 years.

The organization of diabetic summer camps is steadily increasing to meet the needs of the growing number of diabetic children. At least 18 were in existence in the United States in 1940. So, too, the number of diabetic societies was greater and a national society for the promotion of the study and care of diabetics was in process of formation.

In 1940 for the first time both the prevention and the cure of diabetes were effected, albeit as yet only in animals. The laboratories concerned in their epoch-making discoveries were those in Toronto and Philadelphia, but the work itself is the outgrowth of Young's production of diabetes by injection of anterior pituitary extract into cats and dogs.

Haist, Campbell and Best found that if insulin was simultaneously injected with anterior pituitary extract, above mentioned, the appearance of diabetes in the dog could be prevented. Other experiments with rats taught them that the insulin content of the rat's pancreas could be reduced by fasting or by use of a fat diet and lowered still more by the injection of insulin, whereas the amount of insulin rose with a carbohydrate diet. Interpreting these results on the theory that fasting, fat feeding and insulin all rested the pancreas, they demonstrated not only insulin but also fasting and fat feeding would prevent a dog becoming diabetic when injected with anterior pituitary extract.

Working with cats, Lukens and Dohan in Philadelphia found that even after the animals had had diabetes for several months following injections of anterior pituitary extract, treatment with insulin would lead to the disappearance of the lesions in the islands of Langerhans and produce an actual cure of the diabetes.

Diamonds. World output of diamonds in 1939 made another new record high of 12,400,000 carats, an increase of 8% over 1938, all of which came from the Belgian Congo, small increases in Angola and Brazil being more than offset by decreases in Gold Coast, South-West Africa and Sierra Leone. Although the Congo output amounted to 67% of the world total in bulk, it included such a high proportion of industrial stones that the percentage by value was probably nearer half this figure. The British empire produced only 24% of the total by weight, but nearly 60% by value. The Diamond corporation, the central selling agency of the industry, reported sales approaching £6,000,-

DISPLAY OF UNCUT DIAMONDS in New York city, 1940. As a result of the European war, the United States became the world centre of the diamond industry

000 in 1939 as compared with £9,150,000 in 1937, a high of £12,000,000 and a depression minimum of £1,500,000 in 1932.

In 1940 the only South African mine in active operation was the Wesselton, of the DeBeers company, in addition to which some recovery was made from blue ground stocks and from re-washing of tailings. Mine recoveries during the first half of 1940 were only 50% of the average rate in 1939, but alluvial recoveries rose 12% above the 1939 rate, giving a total recovery of 57% of 1939. Gold Coast during the first four months of 1940 was at about 43% of the 1939 average. No other operating data were received.

In 1939 the United States imported 4,211,000 carats of diamonds, valued at \$45,099,000; this total included 154,000 carats of rough, 488,000 carats of cut and 3,569,000 carats of industrial stones. Imports of rough stones during the first ten months of 1940 exceeded the 1939 total by 29%, while cut stones were 52% less and industrial stones 14% less. The demand for diamonds for industrial use expanded at such a rate since 1938 that imports for 1939 and 1940 approximated the total for the two decades immediately preceding.

The occupation of the Netherlands and Belgium by Germany completely disorganized the cutting industry in those countries

DIAMOND PRODUCTION OF THE WORLD and the major producing countries (The Mineral Industry)

and shortly after, steps were taken toward the expansion of the small cutting industries that had been maintained in England and the United States. With the English position hampered by the continuation of the war, it seemed quite possible that both cutting and marketing activities might eventually be centred in New York city.

Dietetics. A high light in nutrition was the discovery of a new vitamin. In 1940 pantothenic acid was identified with the obscure chick antidermatitis fraction of the filtrate factor of yeast. Not only was its structure determined, but it was also synthesized and appeared to function in human nutrition. It was reported 100 mg. of this acid may be administered to men without causing a reaction, change in blood pressure, pulse or respiration.

In well subjects the level of pantothenic acid in the blood is increased after its injection but returns to normal in 24 hours. In patients with pellagra, beri-beri and riboflavin deficiency this acid is 23% to 50% lower than normal in the blood. When the level of pantothenic acid is increased blood levels of riboflavin also appear to rise.

An illuminating study of the effects of a lack of thiamin was reported by workers at the Mayo clinic. Four healthy young women were placed for 21 weeks on a diet extremely low in vitamin B₁ but adequate in other respects. The symptoms which resulted resembled neurasthenia rather than the neuritis of chemical beri-beri. They were anorexia, fatigue, loss of weight, absence of or low gastric acidity, constipation, tenderness of muscles in the calves of the legs. There were also abnormalities in the electrocardiograms. The urinary output of thiamin dropped to 14 micrograms per day. By the time 12 mg. of thiamin had been administered over 12 days' time all symptoms had disappeared.

Evidence that pellagra is usually a complex deficiency of at least nicotinic acid, thiamin, riboflavin and B₆, now identified as pyridoxin, continued to pile up. Twenty more cases were reported in which symptoms of nutritional deficiency, not relieved

with nicotinic acid, thiamin and riboflavin, were treated successfully with pyridoxin.

The year 1940's most interesting vitamin C study was that of carefully controlled case of experimental human scurvy Crandon, Lund and Dill. Their experimental subject received a six months a diet practically devoid of vitamin C. The ascorbic acid of the plasma was low within ten days and zero in a month. It took, however, 132 days for the first objective clinical sign of scurvy to appear. This sign was hyperkeratotic papules followed by perifollicular haemorrhages after 161 days on the deficient diet. Wound healing was normal at three months but blood weakness and weight loss were evident. Wound healing was normal on the 182nd day, at which time the deficient diet was supplemented by ascorbic acid. The level of ascorbic acid in the blood plasma rose gradually to over 1 mg. per 100 cc. after 21 grams had been given in doses of 1 gram every third day. The 132 days required for clinical evidence of scurvy are used as a basis for calculating the minimum requirement as 30 mg. per day.

The dark adaptation test continued to be used extensively in human vitamin A studies. In experimental human vitamin A deficiency Hess found that 14 of his 17 subjects responded at once when vitamin A was again given, although permanent recovery took from six weeks to a year. Other investigators reported that one series of 200 pregnant women under good prenatal control usually had normal dark adaptation, while over a third of another group, 62% of whose diets contained less than 6,000 I. U. of vitamin A, had poor readings. Cutaneous manifestations of vitamin A deficiency in children were reported both from England and the United States. Nine diabetic children of 20 with poor dark adaptation also showed the skin changes. These children did not respond in 14 days to large doses of carotene but after taking equal amounts, i.e., 60,000 U.S.P. units of vitamin A in fish liver oil were normal in 3 to 21 days.

Two obvious lines of study of vitamin K were extended in 1940. First a number of derivatives of 1,4-naphthoquinone with biological value was studied. Of these 2 methyl-1,4-naphthoquinone called "synthetic vitamin K" appeared to be more active than the natural forms. Second, more evidence was collected of the value of vitamin K in assuring normal human blood coagulation as well as some limitation found as to its usefulness. There appears to be no doubt of the value of vitamin K taken both before and after operations, where there is prothrombin deficiency with absence of bile either because of obstruction or operative drainage. Generally accepted also was the value of vitamin K, preferably given to the mother at least four hours prepartum, in preventing or mitigating haemorrhagic disease of the newborn. Evidence of nutritional vitamin K deficiency in adults was still fragmentary, but Kark and Scarborough found diminished plasma prothrombin which responded to vitamin K therapy in cases of clinical hypovitaminosis. Vitamin K treatment is without value in haemophilia.

Some success in the use of vitamin E in the treatment of muscular dystrophies was reported.

The question whether vitamins D₂, that is calciferol, from irradiated ergosterol and D₃, irradiated 7 dehydrocholesterol, the form of vitamin D in cod-liver oil, are equivalent was answered in the affirmative for osteomalacia and late rickets. The vitamin was given orally. This is similar to the greater part of studies on infants. When given by injection, however, D₂ has been reported ineffective for human infants and monkeys.

One reason for the known advantage of milk as the major source of calcium for children was suggested by recent experiments. Increased retentions of calcium were found when lactose was substituted for an equal amount of sucrose in diets containing 0.5 gm. of calcium and otherwise favourable for its utilization.

Severe nutritional anaemia of over 50% of school children was reported from certain areas in rural Florida, in the United States. "Salt sick" is common ailment of cattle in the same areas. The cattle are cured by giving them iron, cobalt and copper. The children, even those infected with hookworm, were brought to normal haemoglobin levels by treatment with ferrous ammonium citrate. This salt may be contaminated with cobalt and copper, but the investigators believe the children's deficiency is primarily iron. (See also VITAMINS.)

Dill, Sir John Greer (1881-), British soldier, born Dec. 25 and educated at Cheltenham college and the royal military college, Sandhurst. He entered the army in 1901 and at the start of the World War of 1914-18 had been promoted to brigadier major. Thereafter he advanced through various grades to the rank of lieutenant general in 1936. His first military assignment was in South Africa (1901-02), where he received the Queen's medal with five clasps. During the war of 1914-18 he was decorated with the Distinguished Service order and the French and Belgian croix de guerre. After teaching in the imperial defence college (1926-28) and acting as commandant of the staff college at Camberley (1931-34), he was appointed director of military operations and intelligence at the war office in 1934. From 1936 to 1937 he commanded the British forces in Palestine, and in the latter year he became general officer commanding in chief of the Aldershot command. On May 26, 1940 he was appointed to succeed Gen. Sir Edmund Ironside as British chief of staff. Ironside at this time became commander in chief of the home forces.

Disasters. During 1940 loss of life and property in accidents and disasters included the following:

Aviation

- Feb. 27 Near Bucaramanga, Colombia. Eleven were killed when a passenger plane crashed into a mountain.
- Mar. 4 Wreckage of the Imperial Airway liner "Hannibal," which disappeared while on the way from Jiwani, Arabia, to Sharjah on the Persian gulf with 8 persons on board, was found on the shore of the gulf.
- Mar. 17 Stromboli island, Italy. Fourteen were killed when the Italian air liner "I-Sutro" crashed against a volcano.
- May 27 Riverside, Calif. Army bombing plane crashed to the ground, killing 6 of the 7 men on board and critically injuring the other.
- June 17 Bellerose, N.Y. Eleven army officers and men were killed when 2 bombing planes collided.
- Aug. 13 Canberra, Australia. A royal Australian air force plane, flying from Melbourne to Canberra, crashed near the latter city, killing 9 persons, including 3 cabinet members.
- Aug. 23 Near Mt. Gaina, Transylvania. A passenger plane on the way from Bucharest to Vienna crashed, killing the 12 passengers and the crew of 3.
- Aug. 31 Near Lovettsville, Va. A plane of the Pennsylvania airlines crashed, killing 21 passengers, including Sen. Ernest Lundeen of Minnesota, and the crew of 4; crash was first fatal accident on U.S. commercial airways since March 26, 1939.
- Nov. 4 Near Salt Lake City, Utah. Ten persons were killed when a plane crashed into the side of Bountiful peak in the Wasatch mountains.
- Nov. 8 Rio de Janeiro. Nineteen persons were killed when a passenger plane collided with another plane and fell into Botafogo bay.
- Dec. 4 Chicago, Ill. A passenger plane crashed after striking a high tension wire at the edge of the airport. Six persons were killed outright; four died later.

Fires and Explosions

- Jan. 3 Minneapolis, Minn. Nineteen killed in a fire which wrecked the Marlborough apartment hotel.
- Jan. 10 Bartley, W.Va. Ninety-one workmen trapped underground killed in an explosion in a coal mine.
- Feb. 29 Arsa, Italy. Eighty-six were killed and 100 injured by an explosion in a coal mine.
- Mar. 16 St. Clairsville, O. Seventy-five persons were killed by an explosion in the Willow Grove coal mine.
- Apr. 14 Colon, Panama. Five persons were killed and 10,000 rendered homeless by a fire which destroyed a third of the city, causing a loss estimated at \$4,000,000.
- Apr. 23 Natchez, Miss. One hundred and ninety-eight persons were burned to death in a fire which destroyed a Negro dance hall.
- May 7 Sandona, Colombia. One hundred and three persons, 67 of whom were children, were killed and 125 injured in a fire which destroyed the municipal palace.

- May 27 Colombia. Twenty members of the crew of the oil tanker "Guayabito" were killed on the Magdalena river when 6,000 bbl. of gasoline on board exploded.
- July 15 Sonman, Pa. Sixty-three persons were killed by an explosion in the Koppers Company coal mine.
- Aug. 16 Joplin, Mo. Five persons were killed by an explosion in the dynamite plant of the Atlas Powder company.
- Aug. 20 Gibbstown, N.J. Five persons were killed by an explosion in the dynamite plant of E. I. du Pont de Nemours & Co.
- Aug. 29 Bologna, Italy. Thirty-eight workmen were killed and 174 injured by an explosion in a munitions plant.
- Sept. 12 Kenil, N.J. Forty-nine persons were killed, about 200 injured and a large number of houses in the surrounding country were wrecked by an explosion in the plant of the Hercules Powder company.
- Sept. 22 Sogamoso, Colombia. Twenty children were killed and 4 seriously injured in a panic caused by an alarm of fire in a motion picture theatre.
- Nov. 12 Woodbridge, N.J. Nine persons were killed by an explosion which destroyed the plant of the United Railway Signal corporation.
- Nov. 12 Edinburg, Pa. Three men were killed when 1,000 lb. of dynamite exploded in the plant of the American Cyanamid and Chemical corporation.
- Nov. 12 Allentown, Pa. Three men were killed by an explosion in the plant of the Trojan Powder company.
- Nov. 25 Haifa, Palestine. An explosion wrecked the steamer "Patria" on which 1,771 Jewish refugees were awaiting transfer to a British colony, killing 22, and seriously injuring 25.
- Nov. 28 Toppenish, Wash. Seven persons were killed by an explosion in a dynamite storage warehouse.
- Nov. 29 Cadiz, Ohio. An explosion in a coal mine trapped 30 miners who died before they could be rescued.
- Dec. 14 Rumania. Fifty-one men were killed and 250 more trapped by an explosion in a coal mine 150 mi. northeast of Bucharest.
- Dec. 17 Cincinnati, Ohio. Thirteen persons were killed by an explosion in an apartment house.

Marine

- Jan. 21 Near Toulon, France. Explosion in engine room of the Italian passenger ship "Orazio" in the Mediterranean set fire to the vessel, resulting in the death of 50 passengers and 60 of the crew.
- Feb. 18 La Corunna, Spain. Twenty-two seamen were drowned when the Spanish steamer "Bandera" sank off shore.
- Feb. 25 Vigo, Spain. Thirty persons were drowned by the sinking of a small boat in Marin inlet.
- Mar. 4 Ningpo, China. Two hundred and fifty persons were drowned when the ship "King Shing" capsized in the Yung river.
- Aug. 2 Near Straits of Magellan. Chilean passenger steamer "Moraleta" struck a rock and was wrecked with the loss of 76.
- Oct. 13 Black sea. A small sailing vessel capsized near Gorele; 33 were drowned.
- Oct. 25 Sweden. At least 44 persons were drowned when a barge, carrying 80 soldiers engaged in manoeuvres, capsized on Lake Armasjaervi.
- Nov. 10 St. John's, Newfoundland. Twenty-eight persons were drowned when a ferry boat struck a small motor boat in Conception bay and sank.
- Nov. 20 Melbourne, Australia. Twenty-four naval reservists were drowned when a merchant ship collided with and sank the minesweeper in which they were sailing across Port Phillip bay.
- Dec. 13 Istanbul, Turkey. More than 200 Jewish refugees from Bulgaria were drowned in the Sea of Marmora when their ship was wrecked.

Motor Traffic

- Jan. 17 Zittau, Germany. Twelve passengers killed and 20 injured when railroad train hit a bus at grade crossing.
- Jan. 29 Mexico. Thirty-two passengers killed and 23 injured when the gasoline tank exploded on a bus running from San Bartolo to Otolopec.
- Mar. 14 McAllen, Tex. Twenty-seven were killed and 15 injured when a passenger train collided with a truck loaded with fruit pickers.

Motor Vehicle Accidents in U.S.A.—1940

Number of deaths	34,400
Number of deaths (1939)	32,386
Number of non-fatal injuries	1,200,000
Deaths per 100,000,000 vehicle miles	12.0

Natural Disasters

- Jan. 2 Kemal Pasha, Turkey. Five thousand drowned and 1,000 rendered homeless by a flood which swept over the region.
- Jan. 18 Balclitoy, Turkey. Fifty persons killed, 160 injured and 200 houses wrecked by earthquake.
- Feb. 10 Albany, Ga. A tornado swept over the city, killing 17 and destroying property valued at \$10,000,000.
- Feb. 21 Turkey. One hundred and twenty-five were killed and hundreds injured by an earthquake which wrecked Soysalli and 3 other villages in Kayseri province.
- Mar. 12 Shreveport, La. Thirteen were killed and 37 injured and hundreds made homeless by a tornado which swept over the city.
- Mar. 29 U.S.A. A tornado sweeping over parts of Texas, Louisiana, Alabama and Mississippi wrecked more than 100 houses and in Pierre Part, La., killed 6 and injured 50 persons.
- April 1, 2 New York and Pennsylvania. Floods caused the death of 17 persons, made thousands homeless and washed away many bridges.
- April 30 U.S.A. Tornadoes sweeping over the midwest and south killed 9 persons and wrecked hundreds of buildings.
- May 18 Imperial valley, Calif. Earthquake killed 8 and injured scores of others in the towns of El Centro, Imperial, Heber, Brawley and Mexicali.
- May 24 Peru. Earthquake which struck Callao, Lima, Chorrillos and other cities killed approximately 350, injured 1,500 and caused widespread damage.

Below: **WRECKAGE** of New York Central train which jumped the track at Little Falls, N.Y., April 19, 1940, killing 31 and injuring 100

- June 30 Southern Tex. Following heavy rainstorms, the Lavaca, Colorado and Guadalupe rivers flooded many towns including Hallettsville and Cuero, drowning at least 10 persons and causing property damage estimated at \$5,000,000.
- July 12 Seoul, Chosen. Fifty-two persons were killed, 100 injured and thousands made homeless by typhoon.
- July 13 Miyake-shima island, Japan. At least 20 persons were killed by the eruption of the volcanic Mt. Yuzan; others reported missing.
- July 25 Chile. Storms in the northern provinces caused approximately 100 deaths.
- July 30 Anatolia, Turkey. More than 1,000 persons were killed by an earthquake.
- Aug. 7 Tex. and La. A hurricane swept inland over the Sabine river region, flooding towns and drowning 19 persons.
- Aug. 11 Eastern U.S.A. A hurricane swept over the coast from Savannah, Ga., to Georgetown, S.C., flooding coast islands and cities and killing at least 16 persons.
- Sept. 30 Formosa. A typhoon which struck the southern coast killed 50 persons, destroyed 5,000 homes and seriously damaged crops.
- Oct. 18 Barcelona and Gerona, Spain. One hundred and eighty-two persons were drowned by floods in these provinces.
- Oct. 20 France. Floods in the southwest caused the death of 100 persons.
- Oct. 26 Nicaragua. Fifteen persons were killed by a hurricane which swept over the Prinzapolca district.
- Nov. 10 Rumania. Four hundred persons were killed and 800 injured by an earthquake which centred in Focsani.
- Nov. 11 U.S.A. A blizzard descending from Canada, accompanied by tornado-like winds and low temperatures, swept over the middle west and Rocky mountain states and as far south as Louisiana, killing more than 100.
- Nov. 18 Jamaica. One hundred and thirty persons were drowned in a cloud-burst in two provinces.
- Dec. 7 Philippines. Eighty-one persons were killed in a typhoon which swept southeast of Manila.
- Dec. 26 Bejucal, Cuba. Forty persons were killed and 150 injured by a tornado accompanied by heavy rains.

Railroads

- Jan. 29 Osaka, Japan. Two hundred burned to death and 100 injured in a train wreck.
- April 19 Little Falls, N.Y. While rounding a curve at high speed, the "Lake Shore Limited" of the New York Central railroad ran off the track, killing 31 persons and injuring 60 seriously.
- May 27 Bahia Blanca, Argentina. Twenty passengers were killed and 27 injured when an automobile struck a railroad train at a crossing.
- July 31 Cuyahoga Falls, O. Forty-three persons were killed when a suburban passenger car collided head-on with a freight train on the Pennsylvania railroad.
- Aug. 5 Near Calcutta, India. Thirty persons were killed and 70 injured when the Dacca-Calcutta mail train was wrecked.
- Nov. 4 Taunton, England. Twenty-seven persons were killed and 59 injured when a London-Penzance express train was derailed.
- Nov. 29 Soochow, China. Seventy-four persons were killed and 102 injured when a Japanese-operated Shanghai-Nanking train was derailed by a blast of dynamite.
- Dec. 3 Velilla de Ebro, Spain. Forty-one persons were killed and 80 injured when two express trains collided.
- Dec. 15 Iguala Caxtal, Mexico. Twenty-five persons were killed and 46 injured when a railroad train ran off the tracks near the city.

Disciples of Christ, a religious body having its chief strength in the United States and Canada, which received its initial impulse in 1809, dates its separate existence from 1830, and its nationally organized work from 1849. It is also well represented in Great Britain, Australia and many mission fields. Local churches are generally known as Christian Churches or as Churches of Christ. The familiar designation, "Campbellite," derived from the name of the earliest leaders, Thomas and Alexander Campbell, is resented. The headquarters of the United Christian Missionary society and other promotional and educational agencies are at Indianapolis, Ind. The National Benevolent association has headquarters at St. Louis, Mo. The annual international convention (United States and Canada), usually held in October, was omitted in 1940 but will meet in May 1941 at St. Louis (H. B. McCormick, president). A North American convention, a mass assembly not related to the organized missionary agencies, was held in Indianapolis in October. Disciples of Christ co-operate in all interdenominational activities, are members of the federal council and are participating in the formation of the World Council of Churches. World membership in 1940 was 1,829,465 (gain for the year, 11,302); churches 8,924 (gain 22). In the United States and Canada there were 1,669,222 members (gain 11,796); 8,070 churches (loss 1); 7,501 ministers (gain 35). Receipts of national and state agencies reporting to international convention

were \$4,044,650. Receipts for local church maintenance, \$11,065,286. There are many independent missionary agencies not reporting. (W. E. GA.)

Dodd, William Edward (1869-1940), former U.S. ambassador to Germany, was born in Clayton, N.C., Oct. 21. He was graduated from the Virginia Polytechnic institute in 1895, taught history there for two years and was on the faculty of Randolph Macon college until 1908 when he became professor of American history in the University of Chicago. He wrote many books dealing with the history of the United States and developed a school of teaching known by his name. He was appointed ambassador to Germany in 1933, serving until 1937 when he resigned.

He defended the rights of American citizens in Germany and incurred the hostility of the Hitler regime. When he returned home he made many addresses criticizing the methods of the German government and when the German ambassador protested to the state department the ambassador was told that free speech was still allowed in the United States. He died in Round Hill, Va., Feb. 9.

Doerpfeld, Wilhelm (1853-1940), German archaeologist, was born Dec. 26 in Barmen, Germany, and was educated at the Bauakademie in Berlin. He early became interested in Greek antiquities and from 1877 to 1881 took part in the excavations at Olympia.

In 1887 he was made secretary of the German Archaeological institute in Athens. He conducted the excavation of many ancient theatres and in 1906 published a book on their design, *Das Griechische Theater*. He was associated with Heinrich Schliemann in the excavation of ancient Troy. Kaiser Wilhelm II bought a lot and built a house for Dr. Doerpfeld on the Greek island of Levkas, where he died April 26.

Dog Shows: see SHOWS: Dogs.

Dolmetsch, Arnold (1858-1940), French musician, was born at Le Mans, Feb. 24, and died in Surrey, England, Feb. 29. For a biographical sketch see *Encyclopædia Britannica*, vol. 7, p. 510.

Dominica: see WEST INDIES, BRITISH.

Dominican Republic, a West Indian republic occupying the eastern two-thirds of the island of Hispaniola; language, Spanish; capital, Ciudad Trujillo; president, Dr. Manuel de Jesús Troncoso de la Concha. The area is 19,326 sq.mi. The population by the 1935 census was 1,479,417. Aside from 73,070 aliens, there were 13% white, 71% "mixed," 16% Negroes. Official estimates of population in 1940 were 1,656,219. The chief cities (with 1935 pop.) are: Ciudad Trujillo, 71,091; Santiago de los Caballeros, 34,175; San Pedro de Macoris, 18,617. Nearly five-sixths (82.2%) of the population is rural.

History.—On March 7 President Jacinto B. Peynado died, to be succeeded by Vice-President Manuel de Jesús Troncoso de la Concha. The change had little significance, however, for Generalissimo Rafael L. Trujillo y Molina, former president and dictator (1930-38), retained political control of the island republic. Plans for the resettlement of European refugees in the Dominican Republic continued. In May the vanguard reached the coun-

try and began development of the 26,000-ac. estate given by Generalissimo Trujillo. It is planned that, eventually, some 100,000 refugees will participate in the experiment, the most extensive of its kind. By the end of 1940 some 500 new settlers were at Sosua; almost as many others were en route. In August, charges were made that the Dominican-German Scientific institute, founded in 1937, was engaged in "fifth column" activity. A loan of \$5,000,000, to be used largely for public works at San Pedro de Macoris, including a highway to Samaná bay (40 miles away), a potential United States naval base, was granted to the Dominican government by the United States Export and Import bank.

Education.—In 1937, there were 845 primary, 7 secondary and 46 vocational schools, with an enrolment of 123,113.

Finance.—The monetary unit is the peso, equivalent to the United States dollar. Since 1905, by treaty arrangement, fiscal control has been in the hands of a financial adviser and receiver-general of customs appointed by the president of the United States. Under a treaty between the two countries, signed Sept. 24, 1940, the control was abolished. The treaty was approved by the Dominican government, but had not received the necessary ratification of the United States senate at the end of the year.

Trade and Communication.—External communication is by sea and air. There are 268km. of railway, and a highway network of some 1,500km. extent. An additional 982km. of railroad is in use on sugar and other estates.

In 1939 imports (79% manufactured goods) totalled \$11,592,166, a 2.2% increase over 1938, coming principally from the United States (59%), Japan (10%), Germany (8%), Great Britain (5%) and British India (4%). Exports aggregating \$18,643,302 (23% more than in 1938) went chiefly to Great Britain (36.2%), United States (27.1%), France (11.9%) and French Morocco (8.7%). In the first third of 1940, imports declined 6.9%; exports, however, increased by 19%, going principally to Great Britain (43.1%), the United States (14.6%), Ireland (13.5%), France (11.6%) and French Morocco (6%). The chief exports are sugar (63.3% in 1939), cacao, in which the Dominican Republic ranks fourth in world production (10.8% in 1939), and coffee (9%). Primarily agricultural, the country depends especially upon these three export commodities. (L. W. BE.)

Donations and Bequests. American philanthropy was estimated by Robert R. Doane as representing a \$20,000,000,000 investment, three-fourths of this in property and the remainder in funds, which brings an annual income of some \$150,000,000. The amount of money which Americans give away each year is a matter for conjecture, and varying estimates have been made as high as \$2,500,000,000. Income tax returns, in preliminary figures for 1938, the last available, show contributions amounting to \$401,939,000. The comparable figures for 1937 were \$440,010,000. This sum represents only deductible contributions to the extent of 15% of income. It does not include foundation giving, and naturally must be accepted as representing only a portion of American donations for the year.

While there were no complete figures on American donations and bequests, there were several indices, and on the basis of these indices it seemed reasonable to estimate that giving in America in 1940 showed a slight upward trend.

One index readily available was the results of 1940 community chest campaigns. A report of 252 chests which completed their campaigns during 1940, for work in 1941, as published by Community Chests and Councils, showed these chests raised a total of \$40,966,012 as compared with \$39,922,415 in 1939, an increase of 2.6%. These chests reached an average of 98.1% of their goals. Only once before since 1920 (in 1931) have chests averaged 98% of their objectives. The index provided by community chest returns represented widespread giving in both large and small communities, and it probably indicated a better average trend than any other index available. The results reported by chests during 1940 would

seem to answer fears that giving to foreign relief has detracted from giving for philanthropic and charitable causes in the United States.

War relief was the object of generous giving in the United States during 1940, but it will not be possible to determine exactly to what extent until final reports for the year have been rendered by war relief agencies to the state department. However, some indication of war relief giving was found in the index of giving next discussed.

For ten years it has been the practice of the John Price Jones corporation to make a continuing study of all gifts and bequests which are publicly announced in seven of the larger cities of the United States. The cities included in the study are New York, Chicago, Philadelphia, Boston, Washington, Baltimore and St. Louis. Admittedly this study gives an index which covers large giving—since only large gifts are usually publicly announced—and it covers giving in centres of wealth. However, this index has long been regarded as a fair indication of the status of giving in metropolitan centres, at least.

During 1940 this study showed the publicly announced gifts in the seven cities studied totalled \$61,997,707, with a comparable figure of \$58,058,032 in 1939. Thus there appears to be an increase of nearly \$4,000,000 in publicly announced gifts in the cities studied.

In these seven cities giving to foreign relief, as was reported publicly, totalled \$14,933,591 as compared with \$4,572,435 in the same cities in 1939. If this index holds for the entire country, it would seem that there has been a great increase during 1940 in giving for foreign relief, but probably at no great sacrifice to continuing local philanthropies. Bequests which became effective in these seven cities during 1940 reached \$15,723,127 as compared with \$22,661,863 in 1939.

Another index of giving is to be found in the number of philanthropic foundations established during the year. There were an estimated 300 foundations on Jan. 1, 1940. Since that time there have been at least 24 new foundations created for various charitable objectives, with resources of varying amounts. This increase in the number of foundations may offset an apparent decrease in the amounts given by some of the larger foundations. A study of nine of the largest foundations shows that their total distributions in 1935 were \$29,395,362, whereas these same foundations distributed but \$25,991,133 in 1939, the last available figures.

On the basis of the indices discussed here, it seems reasonable to assume that American generosity increased during 1940, and might be expected to increase during 1941. Drought. Records of many kinds show that drought conditions of sufficient severity to cause major crop failures and thereby affect a whole nation's economy have occurred at one time or another over nearly every part of the world. The decade from 1930 to 1940 having passed into history, there now can be recorded what appears to be the end of one of the most phenomenal long-period droughts of modern times, a drought that shook the economic foundations of the greatest agricultural country in the world.

During that decade the important central and western agricultural regions of the United States suffered at least seven lean years of rainfall deficiency. In some localities, particularly the so-called "dust-bowl" area of the adjoining parts of Kansas, Oklahoma, Texas, New Mexico and Colorado, only the abundant spring and early summer rains of 1940 brought the parched plains back to their normal verdure. The unprecedented autumn drought of 1939 over the entire middle west was the climax. There still were a few isolated spots, such as in some parts of Nebraska, where the summer and fall of 1940 passed without adequate relief, but for most of the areas the sustained drought had ended in 1940.

The year 1940 brought its own drought problems in some sections. Midsummer dryness was detrimental to crops in the Ohio valley, Missouri, Nebraska, South Dakota and parts of Iowa. The month of July 1940 was drier than or as dry as any July during the arid '30s in these areas, but June and August had ample rains except in parts of Nebraska.

The central Rocky mountain states were lacking in summer moisture until copious rains fell in September. In Utah, particularly in the Great Salt Lake basin, an unusually hot and dry summer resulted in severe losses of unirrigated crops.

Over an area of the southeastern states, centring around Georgia, pastures failed and no sowing was attempted owing to drought conditions during September and October.

Reports of drought conditions in various parts of the world included the long dry period in Australia starting early in 1940 and continuing through September. This was largely responsible for one of the most severe reductions of the wheat crop in Australian agricultural history. The wheat is seeded in May and harvested late in the year. In Ireland the dairy industry and other agricultural pursuits were seriously affected by a long drought which lasted all summer. A dry spring and early summer in China and Japan were detrimental to crops, particularly cotton and rice.

On the whole, the year 1940 was one in which crop curtailment through interference of the war in agricultural efforts was more serious than unfavourable weather. (*See also AGRICULTURE; DRY FARMING; DUST STORMS; IRRIGATION.*) (H. R. B.)

Drugs and Drug Traffic. The drug industry was active during the fiscal year 1940 in reviewing label claims and voluntarily correcting some practices that would be in violation of the new Federal Food, Drug and Cosmetic act when it became effective in all of its provisions on July 1, 1940. The medical staff of the Food and Drug administration developed facts and information upon which to base scientifically sound policies relating to dangerous drugs, adequate directions for use, adequate warning statements and justifiable therapeutic representations. In response to requests, the conclusions and findings derived from those studies were made generally available. Widespread changes in the composition and labelling of many classes of drugs were effected. An example of this educational effort may be seen in the field of so-called headache remedies. The composition of a large number of such preparations was radically changed, and in many instances the dosages of potentially dangerous ingredients were sharply reduced.

Of 2,987 consignments of imported drugs, medicines and devices which were examined at ports of entry during the fiscal year of 1940, 1,192 were refused entry into the United States. In the enforcement of the interstate features of the act, 474 court actions were instituted on drugs and devices. Altogether 10,009 shipments of domestic and imported drugs and therapeutic devices were sampled and examined.

Primary attention was given to the drug products that might be dangerous to health when used in the dosage or with the frequency or duration prescribed, recommended or suggested in their labelling. This was a follow-up of intensive work of 1939. Attention was given to the output of 312 manufacturers, with 194 factory inspections and the examination of 564 domestic samples. Twenty-five consignments were seized.

The examination of preparations purporting to comply with U.S.P. standards resulted in 21 court actions. Of 3,151 cans of U.S.P. anaesthetic ether examined, 10 cans, or less than 0.32%, failed to meet the pharmacopoeial standard. Continued improvement in the quality of anaesthetic ether is evident. Three court actions were instituted because of failure of preparations purporting to be of National Formulary quality to meet the requirements. Eight court actions were instituted against traffic in unofficial preparations.

Legal actions against non-sterile surgical dressings included seizure of 56 consignments of absorbent cotton, cotton swabs and dressings. Continued action against defective prophylactics resulted in 133 seizures. Only three seizures of dangerous devices were necessary during 1940. The term device in the act of 1938 includes instruments, apparatus and contrivances, including their components, parts and accessories, for use in the diagnosis, cure, mitigation, treatment or prevention of disease. These devices are for the first time subject to federal control.

There were on the market in 1940 a great variety of propri-

etary foods that were sold for use in the diet of infants and of adults suffering from some ailment. Many of them unwarrantedly were sold under extravagant claims and fancy names at exorbitant prices. The Federal Food, Drug and Cosmetic act provides that a food shall be declared to be misbranded if it purports to be or if represented for special dietary uses, unless its label bears such information concerning its vitamin, mineral and other dietary properties as may be necessary in order fully to inform purchasers as to its value for such uses. The products of 199 manufacturers of special dietetic products were given attention during the year. Several court actions were instituted.

The act prohibits traffic in new drugs unless such drugs have been adequately tested to show that they are safe for use under the conditions prescribed for use in their label. This makes it necessary for the Food and Drug administration to determine whether each new drug to be placed on the market is safe within the meaning of this provision. Up to the close of the fiscal year 1940 new drug applications to the number of 2,752 were received. (W. G. CA.)

League of Nations.—During the war year Sept. 1939–Aug. 1940 the Opium Advisory committee (O.A.C.), the Permanent Central Opium board (P.C.O.B.) and the Drug Supervisory body (D.S.B.) continued to ensure the working of the international control entrusted to them by the various opium and drug conventions.

The P.C.O.B. and the D.S.B. held their sessions in the spring of 1940 to review the statistics, examine drug estimates, and communicate to governments the statements of estimated drug requirements which constitute the basis of the international drug control. The O.A.C. held its 25th session in Geneva, from May 13 to 17, 1940. It devoted its attention more particularly to the possible repercussions of the war on national and international supervision of drugs. The O.A.C. viewed with concern the possible repercussions of the international situation on the object of its work. It drew the attention of the governments to the fact that recent wars, and particularly the war of 1914–18, resulted in a serious increase of drug addiction and a dangerous extension of the illicit traffic due to the absence of national or international legislation of a repressive character, and to the lack of any adequate system of control. The O.A.C., therefore, strongly recommended that governments and international organs functioning under the international opium conventions should take all necessary measures to prevent an increase of drug addiction.

Governments were also warned not to lose sight of two factors which are a constant menace to the progress so far achieved: (1) the clandestine manufacture of drugs and (2) the progressive accumulation of raw opium stocks due to the constant over-production, as compared with recognized world requirements, of this raw material. These stocks and this over-production offer opportunities for the clandestine manufacture of drugs and directly for the illicit traffic in raw opium.

It should be noted in this connection that the raw opium seized in the far east continued to be of Iranian and Chinese origin. Smuggling continued southward from North China and Jehol. The situation in the far east was in a progressive state of deterioration notwithstanding the laudable efforts of the National government of China.

The work of the O.A.C. concerning the limitation of the production of raw opium reached the advanced stage of a preliminary draft convention, which was referred to governments for consideration. The O.A.C. decided that while it is obviously impossible for the time being to summon the proposed conference to consider the limitation of the production of raw opium, the studies aiming at the completion of the text of the preliminary draft convention should be continued.

Dry Farming. Front page news was conspicuously absent from the United States dry farming area in 1940 as farmers and various governmental agencies continued the long evolutionary process of developing types of farming and livestock husbandry calculated to prevent repetition of the disastrous dust storms of a few years ago. No tragic dust storms developed, although thousands of acres were still unreclaimed, bare or sparsely covered with vegetation and were potential sources of dust storms. In its reports of operations in dry farming areas the soil conservation service of the department of agriculture refers to the successful use of crested wheatgrass in reclaiming grazing areas in the northern great plains. The SCS has planted 150,000 ac. to crested wheatgrass, a plant imported from Russia and Siberia 42 years ago. Advantages of the plant are described as its resistance to drought, insects, weeds and winter killing and that it has 80 to 100% greater grazing capacity than native grasses. In the Pacific southwest kikuyu grass, imported from Uganda, Africa, in 1915, has been found of practical value in preventing gully washing. Probably more fundamental than the selecting and adapting of plants to dry farming areas is the work of the soil conservation service in determining the practical relation between soil maintenance and profitable farming under varying conditions in the dry farming area. A revealing discussion of this problem appears in "The Size of Farms in Soil Conservation" by George W. Collier in *Soil Conservation*, Sept. 1940, published by the SCS. In addition to the SCS and the CCC, the federal land banks and the land bank commissioner were also active in soil conservation efforts, since it is estimated that \$50,000,000 of farm loan security is blown or washed away annually from farms not adequately managed to prevent erosion losses. (S. O. R.)

Ductless Glands: see ENDOCRINOLOGY.

Dust Bowl: see DROUGHT.

Dust Storms. In spite of the prolonged drought that occurred in the summer and fall of 1939, dust storms in 1940 were much less severe in the Texas and Oklahoma panhandles than during any previous year since 1932; winter snows and spring rains tended to make emergency tillage more effective in controlling soil blowing. In west central Kansas and parts of eastern Colorado, dust storms were relatively severe during the spring months of 1940. There was an increase over 1939 in the blow acreage in this area and in some localities dust storms were more frequent than in 1939. In the northern plains states there was no soil blowing which could be classified as a dust storm, though numerous squalls lifted soil in dust storm densities in very small areas. Throughout the great plains farmers were applying conservation measures to anchor the soil against the winds. While no major dust storms are anticipated for 1941, if drought conditions return dust storms will doubtless recur.

In the pastoral regions of Australia, where the rainfall rarely exceeds ten inches and where much of the range is greatly overgrazed, soil blowing is a severe problem. While no major dust storms were reported for 1940, western Australia experienced the driest season in 60 years and local blowing was noted in several regions.

The northern half of the Anglo-Egyptian Sudan, the Sahara and other arid and desert regions of Africa, as well as Iraq, the Gobi

and similar desert regions of Asia, experienced the usual sand and dust storms. These were not unexpected, since such storms have become periodic in those regions. (See also DROUGHT; DUST; FARMING.)

Dutch Borneo: see BORNEO; DUTCH EAST INDIES.

Dutch East Indies, the largest colonial possession of the Netherlands and chief centre of Dutch independent existence since the fall of the Netherlands before the German invasion, consists of a huge archipelago, with several large islands, Java, Sumatra, Celebes and parts of Borneo and New Guinea, and many smaller ones, located near the equator from 6° north latitude to 10° south latitude. The archipelago is south of the Philippines, south and east of the Malay peninsula and north of Australia. Capital, Batavia; Governor General, Jonkheer Dr. A. W. L. Tjarda van Starkenborgh-Stachouwer, appointed 1936. Area, 733,681 sq.mi.; population (1930) 60,731,025; estimate Jan. 1938, 65,000,000. The population (1930) was divided as follows: Java and Madura, 41,719,524; Sumatra, 8,238,570; Borneo, 2,194,533; Celebes, 4,226,586; rest of the archipelago 4,351,812. Largest cities: Batavia, 437,000; Surabaya, 313,000; Bandung, 167,000.

History.—A most important event affecting the position of the Dutch East Indies was the German conquest of the Netherlands in May. The colonial administration announced its loyalty to the government of Queen Wilhelmina in London; German ships in the Indies harbours were seized and German residents of the archipelago were interned. Thanks to Great Britain's mastery of the

JAVANESE TROOPS of the Dutch East Indies were taught the principles of aircraft defence by Dutch colonial officers as the islands braced themselves in 1940 for a threatened attack by Japan

seas, no question of an effective German attempt to occupy the East Indies arose.

A delicate situation came up, however, in connection with the relations between the Dutch colonial empire and Japan. There had previously been some disputes between Japan and the Dutch East Indies, mainly over the questions of restrictions on Japanese imports into the colony and the use of Japanese and Dutch ships in the carrying trade. Japan was in 1940 more interested in the East Indies as a source of strategic raw materials than as a market. A Japanese commercial mission headed by the Minister of Commerce and Industry, Ichizo Kobayashi, proceeded to Batavia to discuss the possibility of larger Japanese purchases of East Indies oil and other strategic raw materials. The situation was complicated because British and American oil interests control about 88% of the oil production of the East Indies; and America and Great Britain were pursuing a policy of restricting rather than expanding trade with Japan. The Kobayashi talks ended without the announcement of any definite agreement.

During the first eight months of the European war (Sept. 1939–April 1940) imports from Japan were 64,500,000 florins, as against 51,500,000 florins in the corresponding months of 1938–39. Exports to Japan during the same period were 27,900,000 florins, as against 14,300,000 florins in the eight months of 1938–39.

The Dutch administration strengthened its repeated announcements of intention to resist invasion by taking a number of measures for military and industrial mobilization and for increasing the air and naval strength of the colony. It is generally believed that elaborate measures have been taken to destroy the oil-wells in Borneo in the event of a Japanese attack.

Education and Religion.—There were about 2,000,000 pupils in the Dutch East Indies schools in 1938. The cost of the educational establishment was about 20,000,000 florins. Higher education for the natives is almost non-existent. Mohammedanism is the general religion of the peoples of predominantly Malay stock who inhabit the archipelago. There are about 1,000,000 Buddhists and a much smaller number of converts to Christianity.

Defence.—At the end of 1938 the colonial army of the Dutch East Indies consisted of 1,170 officers and 35,719 men. There was also a Dutch militia of 1,783 reservist officers and 13,265 men and a *landsturm*, composed of older Dutch inhabitants, suitable for home defence tasks, with a strength of 17,596. The fleet consisted of 3 cruisers, 9 destroyers, 14 large submarines, minelayers, minesweepers and a number of auxiliary coast defence vessels. It is unofficially estimated that there were about 500 aeroplanes.

Finances and Banking.—The unit of currency is the Dutch florin (53.1 American cents in 1939). The Dutch florin is not quoted in international exchange since the German occupation; but the Dutch East Indies florin has retained its original value. The Java bank is the bank of note issue in the colony and there were in 1940 several other banking institutions. Revenue in 1940 was estimated at 582,290,557 florins and expenditure at 654,582,465 florins. There was an all-around increase in taxes after the German occupation of the Netherlands.

Trade and Communication.—Imports in 1938 were 497,385,000 florins and exports were 714,323,000 florins. The principal exports in 1938 were: sugar, 1,077,825 tons; shelled coffee, 68,951 tons; tea, 71,921 tons; tobacco, 47,977 tons; petroleum products, 6,017,393 tons; rubber, 331,243 tons; tin, 26,549 tons. The first effect of the European war was to stimulate the foreign trade of the Dutch East Indies. During the period from Sept. 1939 through April 1940, exports were 597,800,000 florins, as compared with 443,100,000 florins in the corresponding eight months of 1938–39. Imports in the eight months of 1939–40 were

349,500,000 florins, as against 315,600,000 florins in the corresponding period of 1938–39. The German occupation of Denmark, Norway, the Netherlands, Belgium and part of France, and Italy's entrance into the war were unfavourable developments, as regards the foreign trade of the Dutch East Indies. Batavia is the oriental terminus of the Royal Netherlands Airways, the functioning of which has been stopped by the war, although air service in the archipelago continued in 1940. The Dutch East Indies in 1940 contained 43,450 mi. of highways and 4,620 mi. of railways, of which 3,387 were in Java and 1,233 in Sumatra.

Dyestuffs. Because of the unavailability of accurate statistics showing world dye production of coal-tar dyestuffs for the year 1939 (year of latest available figures) due to the war, figures are only given for the industry in the U.S.A.

Production in 1939 was 47% higher than in the preceding year, 43 manufacturers turning out a quantity of 120,190,688 lb. Sales were 30% by quantity and 32% by value above those in 1938. The increase shown for production in 1939 is much greater than that for sales because a considerable proportion of 1938 sales was made from stocks on hand. The inability of foreign producers to meet their export requirements has resulted in increased export business for American manufacturers. After satisfying the domestic needs, dye producers had a considerable surplus for export. The quantity exported was limited largely by plant capacity. This is indicative of the self-sufficiency of the United States as a colour-producing country.

Coal-tar dyes to the extent of 5,212,457 lb. were imported into the United States during 1939, representing principally colours that were not manufactured here because of patent restrictions and specialty products whose sales volume was not sufficiently large or important to warrant expenditures for manufacturing equipment.

There was a definite trend towards the increasing production of the higher quality dyes such as the fast vat colours. These are primarily of interest for application to cotton, rayon and linen. Improved technique in the manufacture and application of vat colours greatly aided the production of fast-dyed lines of merchandise. More dyed and printed fabrics were coloured with vat dyes than ever before. Research resulted in the development of a number of new dyes in 1939 and is constantly pointed towards the creation of colours possessing greater fastness combined with simplified application procedure. The 1925–30 average showed that vat dyes other than indigo represented 6.5% of the total. In 1939, this had grown to 14.6%. There is also an increasing demand upon the dyestuff manufacturer for dyestuffs capable of withstanding new treatments in the processing of fabrics, thereby allowing cloths of original design, finish and improved quality to be manufactured.

(A. G. BN.)

Dykstra, Clarence Addison (1883–), U.S. educator, was born Feb. 25 at Cleveland, O. After graduating with a bachelor's degree from the University of Iowa in 1903, he taught at the University of Chicago (1903–04), at Pensacola, Fla. (1904–06), Ohio State university (1907–09) and the University of Kansas (1909–18), where he became chairman of the department of political science. Temporarily deserting his academic career, Dykstra in 1918 became executive secretary of the Cleveland, O., Civic league. After serving in similar offices at Chicago and Los Angeles, he returned to teaching at the University of California from 1923 to 1929.

The next year he was selected as city manager of Cincinnati, an office he retained until he was chosen as successor to Glenn Frank (q.v.) as president of the University of Wisconsin in 1937. On Oct. 12, 1940 Dykstra accepted the position of director of selective service after the University of Wisconsin had granted him a leave of absence. The senate confirmed his appointment Oct. 15 and he was sworn in two days later, shortly after the national registration for military service. On Oct. 20 Dykstra announced that arrangements for the draft lottery were complete. On Nov. 19 he pledged the assistance of the government in safeguarding the jobs of men called up for military duty under the Selective Service act.

Ear, Nose and Throat, Diseases of. Ear.—“Hearing Acuity and Stammering” was analyzed by Harms and Malone. They stated that speech defects in pupils of elementary grades have been estimated at from 4% to 18%, which meant that 1,000,000 children had defective speech. Speech involved a mental motor mechanism and a proper receiving mechanism, therefore defective hearing was a legitimate cause for defective speech.

These authors emphasized the importance of testing the hearing acuity of all school children before the end of the first grade, claiming that it was as important as the visual acuity tests. At this early age any existing pathologic condition in the ear or speech mechanism might be cared for. They found stammering to be rare in cases of total loss of hearing, and more frequent in those with approximately 50% loss. The relation between stammering and partial hearing loss became more suggestive.

Voss contrasted “Old and New Views on Otosclerosis” citing the fact that the name, denoting hardening or thickening of the tympanic membrane, was hardly a consistent term. Histologic research revealed that in otosclerosis there occurred a change in the individual parts of the bony capsule, compact bone being replaced by spongy, hollow spaces and that this did not represent a simple transition, but the production of new surplus material extending over the old in tumour fashion. Several sites in the ear and temporal bone seem to be subject to such changes. One special area is in the bony structures in the region of the oval window, which if connected with the base of the stapes (stirrup—one of the three small bones of the middle ear) would cause a binding of this bone to the oval window, the binding being termed “ankylosis,” with consequent considerable sound conduction disturbance so that sound could no longer be well transmitted to the labyrinth. Such areas have been seen to arise in other parts; e.g., the cochlea, round window, or along the auditory nerves, with or without involvement of the stirrup base, but thus far it has not been proved that the labyrinth affection was not directly connected with bone disease, though inner ear disease with stirrup ankylosis strongly suggests a possible otosclerotic origin.

Baer presented a paper on “Otitis Media and Dietetics,” claiming that inflammatory changes in the middle ear were due to infection while chemical and physical factors usually affected the inner ear; that the virulence of the bacterial element varied greatly in different localities and conditions and that metabolic changes favoured the outbreak of infection. A poor evaluation of dietetics predisposed the body to infection and subsequent middle ear infection. In discussing the various vitamin deficiencies he emphasized the value of a balanced dietary with normal vitamin intake for individual requirements in infection of the middle ear structures.

“Deleterious Effects of Noise in Industrial Pursuits” was presented by Weyrauch. He restated the well established fact that continued noise often caused lowered hearing, frequently leading to varying degrees of nerve deafness. Autopsy findings and animal research have proved the truth that intense noise can completely destroy the organ of Corti (nerve endings in the inner ear which transmit impulses to the auditory nerve and thence to the centres of hearing in the brain) in the cochlear duct.

It has been found that typists using dictaphones showed a marked depreciation of normal hearing in from one to three years. A large percentage of accidents have been caused by noise, first, because the worker was deafened by the noise and second, because the warning sounds were not heard when submerged in prevailing noise. The practical value of protective measures to prevent deafness among railroad and industrial workers has not as yet been proved.

Selfridge presented several papers dealing with certain nutritional phenomena in relation to the auditory nerve. His observations led him to conclude that degenerative changes in the auditory nerve as found in various disease conditions related to neuritis might have as an underlying basis nutritional deficiency, and that sufficient thiamin chloride should be given which doses should be controlled by the urinary tests instead of by estimation. In addition to adequate vitamin intake, it is necessary to care any endocrine dysfunction. He emphasized that vitamin deficiency should be considered as a factor of some importance in the mechanism that produces degenerative changes in nerve endings. (See also DEAFNESS.)

Nose.—Dr. Arthur W. Proetz, professor of clinical otolaryngology, Washington university, St. Louis, conducted numerous experiments on the physiology of the nose, throat and ear, with especial reference to the act of the mucous membrane lining, the cilia, the cells and kindred structures.

A good many years ago he undertook the study of filling certain sinuses with radiopaque solutions and having X-rays made. He found that could fill the ethmoid and sphenoid sinuses (air spaces in the ethmoid and sphenoid bones) adequately so that any abnormal condition that might present in these spaces could easily be delineated. At the same time studied the effects of certain solutions introduced into these sinuses in relation to the promotion or retardation of ciliary activity. He soon found by animal experimentation, that certain drugs stimulate the function of the cilia, whereas others depress or damage the cilia. In 1931 he published his first work on this subject, entitling it *The Displacement Method of Sinus Diagnosis and Treatment*. The method has been widely used by rhinologists the world over. The author kept careful records of his observations, and collected the opinions of rhinologists everywhere. He continued his observations and in 1939 published the second edition of his famous monograph.

Larynx.—The perfection of rapid colour motion picture films has made photographs of the moving larynx in colour possible, and many laryngologists have successfully produced motion pictures of the larynx. When thrown on the screen, one can clearly see the laryngeal structures and their function, both in health and during the various diseased states. Motion picture photography of the larynx in colour will become a valuable aid in teaching methods because it presents the living larynx exactly as it works in the body, without distortion as seen in the mirror, invaluable as the latter examination may be. All of the above points have been expounded by Gabriel Tucker, professor of bronchology and oesophagology and professor of broncho-oesophagology and laryngeal surgery, in the school of medicine and the graduate school of medicine, respectively, University of Pennsylvania, and many others.

Economic Geology: see GEOLOGY.

Ecuador, a South American republic straddling the equator, and the Andean plateau on the Pacific coast. Language, Spanish; capital, Quito; president, Dr. Carlos Arroyo del Río. The area, including the Galápagos islands (2,400 sq. mi.) is 337,392 sq. mi., according to Ecuadorean claims, but over 1,000,000 sq. mi. are disputed with Peru. In the lack of any census the population is variously estimated at from 2,500,000 to 4,000,000 with 3,500,000 probably a fair approximation. The chief cities are: Quito, 140,000; Guayaquil, 120,000; Cuenca, 42,000; Rio de Bamba, 21,200.

History.—The year 1940 in Ecuador was marked by political unrest and uncertainty arising from an economic depression whose roots lay in the European war's disruption of world economy and in overproduction of Ecuador's principal export commodities. On Jan. 11, former provisional president, Dr. Carlos Arroyo del Río (who had resigned on Dec. 11, 1939 to enter the election campaign) was elected constitutional president. Refusing to accept the official election verdict, however, partisans of Dr. José María Velasco Ibarra, former president and Independent candidate, attempted a coup d'état (Jan. 12), but Pres. Andrés Córdova was able to suppress the movement within a few hours. Velasco was shortly expelled to Colombia. Further revolutionary plots later in the month, in March and in July were nipped in the bud and Pres. Arroyo took office Sept. 1.

By mid-1940 totalitarian propagandists and fifth columnists

were so active that in June formal government investigation began. Two focal points of propaganda, an Italian military mission and the economically unprofitable German-Ecuadorean SEDTA air line, were eliminated by government action which replaced the Italian mission with one from the United States and ousted the German employees of SEDTA. Popular protests over presence of several Japanese "oil explorers" near Esmeraldas in June forced their expulsion. Elimination of propagandists and fifth columnists, to the extent that it was successful, was largely the achievement of a senate committee headed by Senator Filemón Borja, spearhead of an anti-totalitarian movement.

Ecuador gave strong support to the western hemisphere defence program of the Havana conference (*see* HISPANIC AMERICA AND THE EUROPEAN WAR). Reports that naval and air base rights in the Galápagos islands would be granted the United States were rife during the year, but generally met with popular disapproval. The chronic boundary dispute with Peru, regarded by many as potentially the most malignantly sore spot in inter-American relationships, was relatively dormant in 1940 despite some frontier frictions.

Trade and Communication.—External communication is by sea and north and south by air. Almost all exports except petroleum go through Guayaquil. Internal communication is by railways (over 600mi. in length), a 3,500mi. main highway system and the Guayas river. In 1940 \$900,000 from a United States Export and Import bank loan was allotted to new highway construction.

In 1939 imports of 147,860,000 sucres value (principally foodstuffs, machinery, textiles and miscellaneous manufactures) came chiefly from the United States, 48.7% (1938: 34.6%); Germany, 18.1% (1938: 24.1%); Great Britain, 5.5% (1938: 7.7%); Japan, 5.3% (1938: 7.4%); France, 5% (1938: 4.4%); Italy, 3.1% (1938: 3.1%); Peru, 2.6% (1938: 1.4%); Cuba, 2% (1938: 2.8%). In the first seven months of 1940, 56.2% of imports were from the United States. In 1939, exports, 164,841,000 sucres were taken by the United States, 49.1% (1938: 37.5%); Germany, 6.8% (1938: 17.5%); France, 6.6% (1938: 8%); Uruguay, 5.3% (1938: 5.4%); Japan, 3.9% (1938: 2.4%); Great Britain, 3.7% (1938: 4.7%); Peru, 3.5% (1938: 7.4%); Colombia, 3.2% (1938: 1.3%); Chile, 3% (1938: 3.8%). The principal export commodities were: cacao, 20.2%; cyanide precipitates, 16%; petroleum products, 15.1%; gold and silver (in bars and coin), 8.1%; and coffee, 3.4%. In 1939, 13,277,808kg. of cacao, the principal export crop, was exported, 21.3% less than in 1938. The 1940 crop was estimated to be 30% less than that of 1939, exports were 40% less. Petroleum production was 2,354,370bbl. in 1939 and 2,475,000bbl. (est.) in 1940. Petroleum and cyanide production is almost entirely in foreign hands and export values contribute little to national economy. Coffee, valued in 1939 at only 42.8% of the 1937 price, continued low in 1940, but the outlook was materially improved by the Inter American Coffee Quota agreement of Nov. 1940, which allotted Ecuador 150,000 bags of 60kg. each for export to the United States (1938: 68,434 bags). The 1939 coffee crop was 205,333 bags, 6% greater than in 1938.

Finance.—The monetary unit, the sucre, was valued at 6½ cents U.S. in Dec. 1940, after a recovery from a low of 4½ cents in late April. The 1941 budget called for 125,902,000 sucres, with 21.5% to national defence, 7.4% to education, against 121,875,000 sucres in 1940.

BIBLIOGRAPHY.—Ludwig Bemelmans, *The Donkey Inside* (1941). (L. W. BE.)

Eden, (Robert) Anthony (1897—), British statesman, was born June 12 and was educated at Eton and at Christ Church, Oxford. After service in the

World War (1915–18), he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. From 1926 to 1929 he was parliamentary private secretary to Sir Austen Chamberlain. He then became under-secretary for foreign affairs and, in 1934, lord privy seal and a privy councillor. In June 1935 he entered the cabinet as minister without portfolio for League of Nations Affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's policy of "appeasing" Germany and Italy led to his resignation Feb. 20, 1938. Upon the outbreak of war Sept. 3, 1939 he re-entered Chamberlain's cabinet as dominions secretary.

In Feb. 1940 Eden made a tour of inspection through the middle east and welcomed the first Australian and New Zealand troops arriving at Suez. On May 11 he was named secretary of state for war in Winston Churchill's new cabinet. In October he again inspected British defences in Egypt and Palestine and held a series of conversations with Gen. Wavell, commander of British forces in the middle east, during the course of which plans were undoubtedly perfected for the lightning British counteroffensive in North Africa which began Dec. 9. On Dec. 22 announcement was made in London that he would succeed Viscount Halifax, new ambassador to the U.S., at the foreign office; his official appointment took place the next day.

Edey, Birdsall Otis

(1872–1940), U.S. Girl Scout leader, was born in Bellport, N.Y., June 25.

She was active in the movement for woman suffrage, and when women won the right to vote she decided to devote herself to the Girl Scout movement. She was elected scout commissioner for the borough of Manhattan in New York city in 1919 and in 1930 she became president of the national organization, holding that post until 1935, when Mrs. Herbert Hoover was chosen to succeed her. She was then made national commissioner and became chairman of the International committee in the United States, a post which she held at the time of her death in New York city on March 17. She was the author of two volumes of poems.

Education.

The year 1940 was marked conspicuously by wide publication on and discussion of U.S. education and its place in U.S. democracy. No year in the recent history of the country witnessed such an emphasis upon this subject, due to the collapse of democratic governments in Europe and the threat to the American way of life. Many proposals were made, especially during and after the summer months, to spend increasingly of the national resources for arming against anti-democratic conditions and tendencies, within as well as without the schools. The conviction seemed to grow during the year that education had reflected shallowness both in quantity and quality, and that if it was to regain the public esteem which it once enjoyed it would have to improve its quality; and that if it was to become in reality a defence for democracy it would have to direct the energies of the nation into those channels which would lead to reasonably effective action in U.S. life. Educators seemed generally to have agreed that the most important question facing them, if democracy was to survive, was to make education in the United States seriously undertake the task of defending and extending the democratic way of life. The question which they asked was: "How can we create a bold, comprehensive and adequate program in our schools and communities throughout the nation?"

Education and National Defence.—On this subject there was prompt, wide and energetic activity, especially after the fall of France. A committee representing 55 national educational organi-

zations met in Washington in early September for the purpose of mobilizing the educational resources of the nation in the interest of national defence. Meeting as the operating committee of the National Coordinating Committee on Education and Defense, which had been organized early in Aug. 1940, under the auspices of the National Education association and the American Council on Education, the group outlined general plans to make available and to co-ordinate all educational facilities needed for national defence purposes. Willard E. Givens, executive secretary of the National Education association, and George F. Zook, president of the American Council on Education, were elected co-chairmen of the organization, and L. H. Dennis, executive secretary of the American Vocational association, was named secretary. The activities of the group included immediate and continuous representation of organized education for effective co-operation with the National Defense council, the Federal Security agency and other governmental departments and agencies; the stimulation and co-ordination of the efforts of educational organizations and institutions in projects related to national defence; dissemination of information regarding defence developments to educational organizations and institutions; and the maintenance and improvement of educational opportunities essential in a long-range national program.

On June 23 congress appropriated the sum of \$15,000,000 for a summer training program in schools and colleges for workers essential to national defence industries. By Oct. 31, 242,000 workers had been enrolled. The emergency program appropriation of \$15,000,000 with an additional \$26,000,000, was intended to promote the work through October. Later, congress appropriated \$60,500,000 in the supplemental appropriations bill to provide for the training in vocational schools, rural schools, high schools, colleges and universities of more than 700,000 youths and adults as workers to speed up defence industries and governmental services by June 1941. By the autumn the work inaugurated in July was in operation in nearly every state in the union, Puerto Rico, Hawaii and the District of Columbia. The revised program included the continuation of the work begun in the summer; short courses in colleges and universities of engineering to meet the shortage of engineers in fields essential to national defence; training of rural and non-rural youth for national defence; and vocational or related or necessary instruction for young people employed on work projects of the National Youth administration. Numerous conferences held during the year by officials of the United States Office of Education and other leaders emphasized the importance of developing training programs in vocational and technological fields. To this end the United States Office of Education worked closely with the National Defense Advisory commission, war department, navy department and other agencies of the government.

Statistics compiled by U.S. Office of Education, Federal Security Agency, 1940.

The Educational Policies commission of the National Education association and the American Association of School Administrators, which was established in 1935, continued its use of publications and other activities in an effort to define guiding principles for education in the United States. Publications included the development of an educational program in relation to national defence as set forth in important documents including *For These Americas*; *Education and the Defense of American Democracy*; *Learning the Ways of Democracy: A Case Book of Civic Education*; and *Education and Economic Well-Being in American Democracy*.

In August, the faculty of Teachers college, Columbia university, issued a manifesto under the title "Democracy and Education in the Current Crisis," a document which, discussing the meaning of democracy, the gravity of the present situation, the assets of the United States, and setting out "a creed of democracy," was widely circulated and discussed throughout the country. All possible aid to the national defence program was pledged by higher educational leaders as their colleges and universities opened in September. A surge of patriotism appeared in convocation addresses by the heads of these centres of learning which were declared to belong in a real sense to, and obligated to help themselves in readiness to serve, the nation, especially in times of emergencies.

At its annual meeting in August, the American Federation of Teachers strongly endorsed a platform calling for an adequate national defence, protection of labour standards, adequate representation of labour in plans for national defence, the rapid absorption of the unemployed, preservation of social security laws and the maintenance of educational standards of academic freedom and preservation of civil liberties as "integral factors in national defence," and re-elected Prof. George S. Counts, of Teachers college, Columbia university, as its president.

Court Decisions.—During the summer a circuit court of appeals sitting in Asheville, N.C., reversed the decision of a lower court in the case of a Negro teacher who brought action against the school board of Norfolk, Va., alleging an infringement of the constitutional right and discrimination against the Negro teacher in the matter of salary. The original suit was lost by the Negro teacher who appealed the case. In reversing the decision of the lower court, in which the allegations had not been proved, the circuit court of appeals stated emphatically that if the allegations were true—if the Negro teacher did receive a smaller salary than a white teacher with the same type of teaching certificate—the practice constituted discrimination and a violation of the 14th amendment to the constitution of the United States. The school board of Norfolk appealed the case, and in October the supreme court refused to review the decision of the circuit court. The decision of the highest court had direct bearing upon practice of teachers' salaries in many states.

Early in June the supreme court of the United States affirmed the right of a Pennsylvania school board to expel children who refused on religious grounds to salute the United States flag. The case involved two children, brought up in the teachings of a religious sect known as Jehovah's Witnesses, who maintained that saluting the flag was a violation of the Second Commandment. The federal district court for the Eastern district of Pennsylvania gave a decision in favour of the children and ordered that they be reinstated. The local school board appealed to a circuit court of appeals which upheld the decision of the lower court. But both of these courts were reversed by the supreme court of the United States by a decision of eight to one, the majority opinion being written by Justice Frankfurter and the dissenting opinion by Justice Stone.

The Commission on Teacher Education.—This agency of the

THIS STANDARD LESSON for British school children shows what to do in case of an air raid

American Council on Education, appointed in 1938 for a period of five years, continued its co-operative study of teacher education in connection with 20 higher educational institutions and 14 school systems, for the purpose of improving the pre- and in-service preparation of elementary and secondary school teachers. Through a staff of 10 persons under the directorship of Karl W. Bigelow, the commission has been providing consultant and other services to that end. In addition to the staff of the Washington office of the commission a collaboration centre was maintained at the University of Chicago for the study of child development and teacher personnel. During 1940 the activities of the commission were extended to include the pre- and in-service preparation of college teachers. A representative of the commission visited those graduate schools whose Ph.D.'s go into college teaching and undergraduate colleges that are actively promoting the in-service growth of teachers. During the summer the commission conducted a workshop at the University of Chicago where representatives of the 34 institutions and school systems associated in the study of teacher education worked on special subjects. Types of materials developed from the Chicago workshop included detailed results of the evaluation device produced by the Committee on Evaluating the Workshop, some of the addresses given at the workshop, and the daily minutes of some of the various groups that comprised the workshop, and the procedures of the undertaking.

The American School of the Air.—In October this organization began its 12th year of service, under the new title, School of the Air of the Americas. This educational feature, which was originated by the Columbia Broadcasting system in 1929 and in which the National Education association has co-operated since 1938, will be heard during the school year 1940-41 in more than half of the republics of the western hemisphere. The Canadian broadcasting corporation made the programs available to all schools in the dominion. In Canada and in the republics which received the programs, the English language was used; in other nations the programs were translated into Spanish or Portuguese under the direction of the ministers of education. These educational programs were strongly endorsed by Secretary of State Cordell Hull as a feature of the exchange of cultural relations between the Americas, for the purpose of deepening and broadening understanding between the peoples of the American republics.

A vigorous program of action in behalf of democracy for the children of the United States was formulated by the White House Conference on Children in a Democracy, which was held in Washington in January. The program was the culmination of studies that had been in progress since the organization conference was held in April of 1939. Similar conferences had been held previously; one at the call of President Theodore Roosevelt in 1909, another at the call of President Woodrow Wilson a decade later, and another called by President Herbert Hoover in 1930. The 1940 conference was sponsored by President Franklin D. Roosevelt. Numerous recommendations, drafted in reports of subcommittees composed of welfare workers, educators, religious and civic leaders and others, were approved by the conference.

The Eighth American Scientific congress was held in Washington in May and was attended by numerous delegates from the United States and several South American countries. The section on education was in charge of President Nicholas Murray Butler and Professor I. L. Kandel of Columbia university.

In the annual report of President Raymond B. Fosdick, of the General Education board, announcement was made that that foundation was in process of liquidation and within a few years its remaining funds would be entirely exhausted. At the time of the announcement it was pointed out that since the founding in 1902 of the General Education board, by John D. Rockefeller, Sr., the foundation had granted more than \$265,000,000 for various educational projects. When the foundation was established, its first activities were in the southern states where the career of the foundation will end—in the same "area where the need is still great and where significant and promising developments are underway."

The establishment of a university centre in Atlanta, Ga., was finally assured by the conclusion of a successful campaign for funds totalling more than \$7,500,000. The plan is to co-ordinate the services of six educational institutions in and around Atlanta, for the purpose of elevating scholastic standards, increasing facilities for research and graduate study, and eliminating duplications in essential courses. Participating in the university centre are Agnes Scott college and Columbia Theological seminary at Decatur; Emory university, the Georgia School of Technology and the Atlanta Art association, at Atlanta; and the University of Georgia at Athens. There will be no mergers among the schools, but a co-operative program will be developed by an advisory committee representing all the institutions. Funds for the project came through private gifts and public subscriptions, amounting to \$5,000,000, and a grant of \$2,500,000 by the General Education board. (See also ACADEMIC FREEDOM.)

British Empire.—The influence of war on education could not at the close of 1940 be fully estimated. The scheme of reorganization on which all countries of the British commonwealth had embarked had to be largely suspended in all aspects which demanded and increased expenditure. The

reorganization of methods, curricula and the whole tenor of school life was continued with the same vigour in spite of the war. As the New Zealand latest report says: "Yet ultimately the effects of the war on the schools may be deeper than any of the external changes can strike. There is amongst all concerned with education a growing realization that it is in the schools that future citizens must not only learn how democracy works, but must also develop a passionate belief in the fundamental human values for which democracy stands." The common trends in educational development in democratic countries were well summed up by the minister of education in New Brunswick: (1) there is a striking tendency for pupils to remain longer in school and in ever increasing numbers complete the work of the secondary grades; (2) the widespread adherence to the belief that "we are never too old to learn" led to an extension of adult education in a wide variety of forms; (3) the significant and constructive studies of rural education have resulted in an adoption of the larger unit of administration with a reorganized basis for the financing of rural schools. In this respect the Nova Scotia *Report on Rural Education, 1939*, gives a comparative survey of general trends in the English speaking countries.

Canada.—The federal grant for youth training was continued in 1939 and 1940. In Quebec a new normal school was opened at Amos and thus all the regions were now provided with centres of pedagogical training. The trial of the new course of study introduced in 1938 resulted in the raising of the entrance standard to normal schools by two years. Special courses in drawing, agriculture and household science were organized for teachers in 1939, and a special pedagogical library was instituted. In Ontario new courses of study were issued for grade XI in Sept. 1939, thus completing the reform of the curriculum. The consolidation of rural areas was continued in 1938, doubling the total number of consolidated townships to 28. In New Brunswick the first six grades of the new curriculum were authorized for general use in Sept. 1939. It outlines for the teacher a sound approach to child development. The new program for the upper six grades was being experimented with by selected teachers and was to be introduced as soon as possible. The first rural high school was founded at Bayside. In 1939 an act was passed for the establishment of a provincial council of education. In Prince Edward Island the curricula in agriculture and nature study were revised on the basis of the child as a centre of training in terms of activity and experience. In British Columbia drama and oral expression were introduced in grade XII in 1939. Progress cards similar to Dalton Plan cards used in England were introduced in 1939. In Saskatchewan the committees were revising the courses of study but had not reported by the autumn of 1940. In Manitoba the legislature voted \$10,000 for scholarships in order to equalize the opportunities for higher education. Grade XII was reintroduced in 1939, being in suspense from 1932.

New Zealand.—The policy of the government to secure for every child free education adequate to his needs was continued in 1939. Sixty-four per cent of the children leaving primary schools went on to post-primary schools which offered a wider range of alternative courses than ever before. The consolidation of rural schools largely met the needs of the country children. More attention was given to music, drama, arts, physical skills of all kinds and independent reading. A new superintendent of physical education was appointed in 1939, who introduced a system of training based on the syllabus of the English board of education. Two new intermediate schools were opened.

South Africa.—The problem of dual control continued to be the subject of discussion between the Union minister of education and provincial directors. The Union insists on a greater development of vocational education which is under its control and accuses the provinces of paying too little attention to differentiation of curricula according to abilities. The superintendent of the Cape province answered the criticism in his report of 1939. The Cape education department celebrated its centenary by an issue of *Education Gazette* containing texts of historical documents. In Pretoria the laying of the foundation stone of the Voortrekker memorial served as a centre of many educational activities. Other features in Transvaal were the continued centralization of rural schools and the establishment of nine junior high schools which will play a similar role in urban districts to that of school farms in rural areas. They are pre-vocational two-year schools—preparing for technical and commercial schools under the Union. The transfer of two agricultural schools from the Union to the province proves that in Transvaal at any rate the dual control is no obstacle to co-ordination of the two systems.

Australia.—As the minister of education in Western Australia said in his report: "The need for federal aid to education is increasingly urgent. In this way only can reforms be effected that will bring it into line with modern developments in educational practice and enable it to meet satisfactorily the requirements of all sections of the population." However, the absence of federal aid did not stop the progress of Australian education. In Victoria many new buildings were erected and all services were extended. There was an increasing demand for secondary education in country districts. It was strikingly illustrated by the development of bus services bringing pupils from rural schools to centres of secondary education. New post-primary courses were established in six centres. Woodwork and sheet-metal courses for boys and needlework and cookery courses for girls were provided in all centres. In Western Australia the consolidation of rural schools was continued which resulted in the steady increase in the numbers of pupils remaining in the higher classes of post-primary schools. In Tasmania the development of area schools was continued, four new schools being added in 1939. In Queensland the amended syllabus of 1938 proved to be an improvement as it is better adapted to the mental ages of the children. The development of initiative and resourcefulness is directly

fostered through the "purposive activity" of the pupils.

British India.—India was just in the committee stage of a radical revision of her system of education. Great attention was being paid to the extension of girls' education and attracting women to the teaching profession. United Provinces provided a special fund for 150 women teachers in primary mixed schools in recognition of the fact that women are the teachers of small children of both sexes. The Wardha scheme promulgated by Mr. Gandhi was a central subject of discussion in all provinces. Gandhi's view that Indian education should be based on rural occupations and vocational training found support even among British educational experts. There was a noticeable increase in numbers in post-primary grades in girls' schools during the last two years.

General World Trends.—The war continued to take its destructive toll in the field of education during the year 1940. Marching armies and bombing aircraft destroyed school buildings, scattered children and teachers, caused many casualties among them. Forty professors of the Polish universities alone died during the year, half of them, however, as the result of harrowing experiences in concentration camps. The expulsion of populations from some lands and the exchange of nationals between others resulted in an almost complete stoppage of education in large areas. The countries ravaged by German armies in 1939 there was some reconstruction; in those invaded by German armies in 1940 there was

*For 1937-38.

destruction. Because of the need of mobilizing for national defence in European countries, combatant and neutral, the universities were largely denuded of students. In all save a few nations the expense of maintaining armies and navies caused a marked reduction in the amounts provided for schools. Guns have not only been preferred to butter but they have more been preferred to schools.

The war had an increasingly profound effect upon the aims and methods of education. Almost everywhere there was the demand for more practical education, for activities that would assist in the national defence. Physical training received emphasis in all countries, manual training in countries like China, shut off or partially shut off from the rest of the world by blockading armies and navies. Agriculture, medicine, engineering, technical subjects were preferred in universities as against academic courses. The splendid adult education movement in the Scandinavian countries and Finland, however, was almost destroyed, save in Sweden, and it seriously modified in Sweden. This led to an increased respect for, and expansion of, correspondence courses. Practically in every country there resulted in a marked increase of nationalistic feeling.

The reaction to conquest by invading armies was markedly different in the various conquered countries. In China, where life was badly disrupted, the determination to remain free resulted in the repeated trek of universities from their original sites in eastern China to places in western China. Moreover, the Chinese universities were inspired by new and forward-looking ideals which have already produced far-reaching effects in elevating standards, quickening interest in primary and adult education and stimulating students to organize the people in relief and in social services. In conquered France, on the contrary, apathy and a feeling of despair pervaded the country. Reactionary influences control, as they do wherever the Germans have conquered. The republic was abolished and the inspiring words of the revolution, "liberty, equality, fraternity," gave way to "work, discipline, fatherland." The laws restricting religious schools were repealed, emphasis was placed upon moral and civic education, history textbooks were revised, and the new system is characterized by an antagonism to humanism and secularism that formerly prevailed. The most insipid belligerent country educationally, as in so many other ways, is Great Britain, which remained unconquered. Attendance at educational institutions and appropriations for their maintenance actually increased during 1940.

One of the most conspicuous results of the war was the exodus of scholars from the war areas to lands where they might work in peace and security. This was particularly true of the countries overrun by the German armies during 1940. No such migration of scholars has taken place since the revocation of the Edict of Nantes by Louis XIV in 1685. Many scholars found refuge in the United States and had a hospitable reception. The loss to the war-ridden areas of so much creative talent that will be needed for reconstruction purposes after the war and the gain to the United States of the use of their great abilities can hardly be overestimated.

(S. D. N.)

Nursery Schools.—The latest office of education survey (1936), shows 285 nursery schools in the United States. But this figure is far under the actual figures since a 1940 survey shows 283 private schools for young children from two to six years in Massachusetts alone. The typical range of nursery schools is two to five years. Half are in full-day, half in half-day session. In addition to the primary service given children, schools function as centres for research, teacher training, parent education and, in public high schools, as laboratories for pre-parental training in child care and family relations. The high professional training of nurses

chool workers is shown by the fact that 82% have bachelor's or higher degrees.

Many new housing projects, both federal and private, include nursery facilities in their planning. Welfare agencies for many years have been converting day nurseries into nursery schools with trained staffs. The Work Projects administration report as of June 1940 shows 1,364 emergency nursery schools with 39,853 children enrolled in 48 states. State and local contributions to their maintenance are increasing.

(See also EDUCATION, ADULT; EDUCATION, ELEMENTARY; EDUCATION, PROGRESSIVE; EDUCATION, SECONDARY; EDUCATION, VOCATIONAL; UNIVERSITIES AND COLLEGES.)

(J. E. A.)

Education, Adult. In common with other institutions and activities throughout the world dependent upon freedom of action, adult education encountered in 1940 a year of curtailment. Following annihilation of the movement in Czechoslovakia and Poland as a result of German partition and occupation, the strong Finnish movement was crippled by Russian invasion. The exigencies of the brief but costly warfare that followed caused a natural preoccupation with material defence, but at no time did Finland lose sight of its free adult education as a necessary and vital concomitant of democratic processes. The Finns continued to publish their adult education periodical and relied upon adult education as one means toward national rehabilitation.

The subjugation by Germany of Norway and of Denmark presents a less encouraging outlook from the point of view of adult education. Denmark, cradle of the folk high school movement, existed in 1940 under a system of sufferance accorded by alien military authorities. Information received despite military censorship indicates that certain folk high schools have closed. It would be safe to conclude that those which might continue were operating either so circumspectly as to destroy their effectiveness or that outright attempts were under way to convert them to propaganda uses. In Norway, with a much less well developed system of adult education, similar conditions are believed to obtain. In Sweden, effort was made to conduct the folk high school, study club and co-operative movements as usual. The constant threat of military power to be exercised either by Russia or Germany was undeniably an unsettling factor. The Swedish institutions, however, carried on.

In Holland and in Belgium under German occupation it is unlikely that any vestige of the pre-war adult education activity remained. Strict censorship prevailed and the right of public assemblage was abridged, both factors inimical to free adult education. In France, which never possessed an organized adult education movement, such small efforts as were supported by organized labour succumbed to the twin evils of German occupation and a pro-fascist post-war government.

In South Africa, India and China, mass education movements for adults, mostly on the elementary level, were seriously interrupted by war. In Japan, complete defection of representative government and replacement by dictatorship indicated the end of adult education efforts for the present.

The nations constituting the British commonwealth all suffered decreases in their adult education programs, the cause lying in the urgent war-occasioned need to devote money and energies to direct defence. However, the extent to which the British people were able to preserve their democratic forms and allied educational interests is remarkable. The degree of loss, of course, was commensurate with actual nearness to the theatre of conflict. But even in the face of continual bombardment, Britons continued to study and to discuss. The scope of discussion included not only social and governmental questions but the arts—painting, literature, drama and music. Certain new activities were started, devised particularly for workers in war industries. The navy educational program, in considerable part organized on a basis of correspondence instruction, flourished. The army and air force programs were less successful. The British Institute of

Adult Education was in 1940 carrying on an active program in co-operation with other organizations, both private and governmental. Activities in Australia and New Zealand continued but were somewhat handicapped by lack of funds. In Canada, the Canadian Association for Adult Education increased its efforts with the civilian population and in addition assumed important responsibilities in connection with the armed forces. Its series of bulletins dealing with war and defence issues was a notable contribution.

In the United States, adult education in 1940 allied itself with the paramount issue of national defence both in the materialistic and in the cultural sense. The annual meeting of the American Association for Adult Education dedicated itself to the doctrine that the democratic way is in truth an educational process. Close co-ordination of the adult education program of the U.S.A. was effected with the national, state and local defence committees. Proffers of assistance to the army and navy were made. Attention was given to the need for vocational training in order to supply war industries. Increased emphasis upon study and discussion groups resulted in a widespread demand for materials of instruction related to defence issues. Preparation of these materials on several levels of difficulty was begun. Forum activity was not permitted to diminish. Increases in the number of state and local organizations for adult education were noted, and the number of state and regional conferences was augmented.

Decreases in the relief program of adult education were offset in some degree by the assumption of new responsibilities by the tax-supported local school systems. The burden upon the private voluntary agencies increased.

Education, Elementary. The year 1940 brought further impetus to the growing movement to make education an instrument of national policy. Previously most of the totalitarian states had so organized learning for the childhood years that those future citizens came to believe fervently in the national aspirations and the ethical principles of their fatherland. Education for those "totalitarian" children did not primarily emphasize the development of whatever unique qualities they might individually possess. On the positive side, education for those young citizens consisted of facing the more obvious problems of the national group—such as eliminating illiteracy, reducing the power of a racial minority group, conserving wild life, or picking up scrap metals. Along with this active participation in solving national problems went a study of the national goals. Elementary education had become for all the children in those totalitarian nations a dramatic experience in doing socially useful tasks with a dual purpose of getting important work done and of developing the deeply rooted loyalty to a cause that follows a sacrifice willingly made.

Most laymen or educators acknowledge that the educational systems of those totalitarian nations have worked exceedingly well to accomplish their desired ends, and with the turn of events in world affairs, the democracies have critically re-examined the education of their future citizens. The question is raised on every hand—should education in a democracy be revamped? Much more was heard in 1940 than ever before of an elementary education that would develop appreciation of, and loyalty to, democratic institutions and ways of living.

An education to accomplish such objectives goes beyond the four walls of the traditional classroom. Hence children are being taken out to observe the manifold accomplishments of men and organizations in their local communities. Pupils are participating in celebrations commemorating events of the living as well as

CLASSROOM in the Crow Island school, Winnetka, Ill., completed in 1940. Designed by Eliel and Eero Saarinen, the building is a notably successful adaptation of modern architecture to the study requirements of elementary grades. Architects: Perkins, Wheeler and Will

names and dates of history. They are studying the great productive and marketing activities of modern society. To the extent that young children are mature enough to carry a part in community activities of a constructive nature, they are encouraged to work along with adults in beautification projects, in the improvement of the facilities for, and the use of, recreational opportunities, in the increase of health safeguards and health practices, etc. The trend is away from an exclusive reliance on verbal catechism of democracy and toward an active participation in, and support of, the numerous activities carried forward in a democratic community. In instructional materials the trend is clearly toward a democratic citizenship. Many new readers have been issued for use in the elementary grades that are built around the problems and promises of the democratic way of life. Social studies textbooks, arithmetic problems, composition manuals, anthologies of stories and poetry and almost every school text include an increased amount of material on the history, philosophy and current accomplishments of the nation. Teachers' guides and teaching suggestions stress citizenship more than ever before.

In the United States the effect of the war was not so far reaching nor dramatic. Noticeable was the threat of mounting national debt and higher taxation which resulted in halting advances in teachers' compensation, in keeping instructional supply budgets low and in retarding general improvement of the educational program. The one exception possibly was the physical plants, which were materially improved during 1940 through relief work projects of the WPA. One important factor in elementary education in the United States was the obvious decline in birth rate with the consequent decrease in enrolment in the lower grades.

The year 1940 was marked with heated controversy over the relative effect of inheritance and environment on the development of intelligence and personality. Most conferences on the issue concluded that the personality is the result of an interaction between these two factors rather than dependent on one or the other.

A careful study was made during 1940 of the place of such skills as reading, writing and figuring in the newer elementary curriculum. All educators seemed to agree that greater facility in the use of such skills was necessary. Experimental work was undertaken on the methods of mastering such skills in the projection of larger units of work.

(P. R. H.)

Great Britain.—A year of war was a year of disturbance of new problems for the elementary school. The evacuation of children to more sparsely inhabited districts, their gradual return to the cities where schools were being used for other purposes and the hurried provision of shelters so that the schools could be restored to their proper use caused serious disorganization of the teaching and medical services and of school attendance. Intensive bombing in certain districts necessitated a second evacuation, as well as the preparation of fresh arrangements in many other areas.

Much discussion took place on the question of compulsory or voluntary evacuation, and the difficulties received much more attention than the benefits. Yet where careful inquiry had been made, as in the Cambridge survey and the Liverpool survey, the results were reassuring and showed a measure of success far different from the impression given by less careful reports.

Out of the new conditions was emerging a wider conception of elementary education and its place in the national life. Ingenious improvisations, experiments in home teaching, the adaptation of curricula to new environments, the establishment of camp schools in the country, extended arrangements for communal feeding, and the participation of school children in such national movements as the war savings campaign, the collection of salvaged food, the growing of more food were finding an echo in the discussion about education that were springing up in all kinds of places.

Teachers and pupils alike showed a spirit of endeavour. The war savings movement was in operation in over 90% of the schools and it is recorded that one girls' school which previously collected less than £2 a week raised its weekly savings to £250. Many school gardens showed similar striking increases in productivity and thousands of pupils assisted the war effort in other ways.

The close connection between health and education was illustrated once more by figures published by the London County Council. In the last 30 years the average height of boys increased by 2.2 in., of girls by 2.1 in.; in weight the increases were 7 lb. and 8.1 lb. The greatest increase was in the age group 11 to 13 years, a proof of the physical importance of the extension of school-leaving age. The death of H. A. L. Fisher who, towards the end of the war of 1914-18, raised the question of national education to fresh significance, was a reminder that events would soon demand a new educational statesman able to adapt institutions to the rapidly changing forces of modern life.

Education, Progressive. Progressive education markedly influenced the educational theory and practice toward broadening the conception of the role of the school from one of primarily training children in the three R's to one of considering the whole development of the child as an individual and as a member of society. This concept lays increased emphasis on the fine arts and other forms of self-expression, on mental hygiene and family relationships, and on a study of our changing civilization and the part each member of a democratic society must play in guiding that change. While the spirit and ideas of progressive education have affected schools generally, the organized movement is represented by the Progressive Education association (president, Carleton Washburne; executive director, Frederick L. Redefers).

This association, which is the United States section of the International Education fellowship, had a membership in Sept. 1940 of 10,000. During the year 1940 it held a national conference in Chicago, Ill., attended by 4,000 persons, and 29 regional conferences.

study groups and 10 "workshops" in various parts of the United States and Canada. The association has fostered scientific research and the preparation of curricular materials through its various national commissions and committees.

These include committees on child development and elementary education; all-youth; mental hygiene; conservation of human resources; museum-school relations; radio education; camping; international relations; and service and members; liaison officers in educational freedom and in co-operatives and economic citizenship; a joint commission with the N.E.A. on problems and use of human and material resources; and standing committees on policies and plans, publications, finance and editorial policies for the association's two monthly magazines, *Progressive Education* and *Frontiers of Democracy*.

During 1940 three committees and several commissions brought their work close to completion. The committee on workshops, after five years of pioneer work, reflected in colleges and universities throughout the United States, was transferred in toto to the commission on teacher education of the American Council on Education; the committee on the philosophy of progressive education made its final report in a scholarly manuscript; the committee on evaluating the results of progressive practices completed its report with a document summarizing the results of all scientific comparisons of progressive and traditional methods.

The commissions on secondary school curriculum and the study of adolescence published several volumes giving the results of their work since 1933. The commission on the relation of secondary schools and colleges completed its eight-year study and began work on the publication of five volumes on its results.

The following books were published by the association during 1940: *Language in General Education*; *Reader's Guide to Prose Fiction*; *Visual Arts in General Education*; *Mathematics in General Education*; *Emotion and Conduct in Adolescence*; *Social Studies in General Education*; *Physical Education in the Secondary School*; *The Personal-Social Development of Boys and Girls*; *Bibliography on Secondary Education*; *Professional Education for Experienced Teachers*.

Education, Secondary. The rigours of censorship make it difficult to secure accurate information of what was happening in 1940 to secondary education in the occupied territories of Europe. Reports which came through seem to indicate that educational institutions were being reorganized with characteristic thoroughness to coincide with the Nazi concept of educational purposes and the appropriate role for citizens of a subject state. Poland appeared to have suffered most severely; its universities and lycées were suppressed and their faculties largely confined in concentration camps. In France a thorough-going reorganization of secondary education in line with totalitarian philosophy was instituted under the direction of the minister of education of the Vichy government.

United States.—Developments for 1940 in the United States, in the main, continued already discernible trends. Attacks on problems of curriculum by state and regional organizations continued, with selected secondary schools in California, Michigan, Ohio and the Southern Association of Colleges and Secondary Schools given freedom and encouragement to experiment with revised curriculums. Increased attention was given to the use of radio and motion pictures in the school and to planned excursions. Closer co-operation of the school with its community was stressed, both in interpretation of the educational program and in definite participation of the school in community improve-

ment. There was a growing awareness of the responsibility of the secondary school toward all youth, illustrated in the effort to hold in school pupils who would ordinarily drop out, and in conscious co-operation with other agencies ministering to the needs of youth—the NYA, the CCC and the rapidly expanding adult education movement. A special phase of this responsibility was recognized in the organization of guidance for pupils of secondary school age. A broadened concept of guidance involved conscious participation of a larger proportion of the teaching personnel.

Schools undertook increased responsibilities in co-operation with the defence effort, both in expanding opportunities which types of technical training called for in the armament industries, and in heightened emphasis on education for democratic understanding and civic responsibility. Notable publications of 1940 which have implications for secondary education included studies of the status of rural and of Negro youth and of employment opportunities by the American Youth commission and an analysis of specially promising programs of civic education in secondary schools by the Educational Policies commission.

Latin America.—Significant developments were found in Latin America. With the exception of Argentina, where the secondary school antedated the university and developed along more democratic and liberal lines than elsewhere, secondary education in the South American countries was patterned largely along European lines with classical emphasis. Current proposals for reorganization were in the direction of a more liberal curriculum.

Great Britain.—It seemed a far cry to those spacious days before the war when educationalists worried about the decline in the school population, the future of the public schools, staggered holidays and examination reforms. In the closing months of 1940 educationalists had to concentrate on the daily round, the common task—to keep the schools alive and as efficient as war-time difficulties permitted. The first phase appeared to be over. In this a large part of the secondary school system was disrupted by evacuation, commandeering of school buildings and closure in certain areas. Improvisation took place on a large scale. Classes were taken in all sorts of odd buildings and time-tables were strangely different from the past. Outdoor activities, gardening, domestic duties in some places partly ousted the standard subjects of the curriculum. Some schools shared buildings, some worked half time and some had to be content with various forms of directed home studies. In evacuation areas, where the state schools were closed, private schools and commercial colleges emerged and plied for hire. As time passed on and air raids did not develop to any extent, normality was partly restored. Schools were opened and the bulk of the children returned from the reception areas. By the summer of 1940, with the release of commandeered schools and the construction of air-raid shelters, the majority of the pupils had resumed a reasonable though restricted form of secondary education, though there were still many instances of schools being run in parts—one at home and the other in an evacuation centre.

The second phase was now upon the country. Staffing difficulties were growing, owing to the raising of the reserved age and the transfer of science masters to war work. It might be that the teaching of science would be radically affected, especially in evacuation schools which often lacked full facilities for practical work. Many of the schools were kept open during the summer holidays—a strange contrast with the policy of dispersal

and evacuation—and there was a danger of staleness creeping over staff and pupils. In addition there was the nervous excitement due to air-raid precautions and war tension. Many schools in the heavily raided areas were faced anew with evacuation and removal. Some of these were in serious difficulty due to a fall in numbers and were seeking amalgamation with other schools in safer areas.

All schools were faced with the problem of the shortened school life. The proportion of leavers was higher, not only due to economic pressure but also because of the competition for boys to replace men called up for war service. In addition some universities lowered their entrance standards, thus providing an extra incentive to the secondary school pupil to get started early on his university career before military service claimed him. This was bound to have a serious effect on sixth form work and also on the quality of the university entrant.

Briefly the tendencies seemed to be: (1) a falling off in sixth form work; (2) a lower leaving age and a fall in numbers; (3) a restriction and unbalancing of the curriculum due to staffing problems; (4) a growth of realistic and utility subjects at the expense of the traditional cultural subjects; and (5) a transfer of pupils from some boarding schools to the local grammar school.

(T. TH.)

Education, Vocational. In the United States during the year 1940 vocational education focused its efforts primarily on problems of training for national defence. During 1939 vocational schools in certain areas began to train mechanics for aircraft plants on a limited scale. In June 1940 congress appropriated substantial funds for the training of mechanics for all defence industries, and the vocational schools of the nation undertook the great task of organizing those training programs. Taking advantage of the summer vacation period when regular vocational classes were not in session, extensive training programs were started in the several states. Within the first month 80,000 persons were enrolled in day, evening and all-night classes, which included upgrading courses for employed mechanics and pre-employment "refresher" courses for persons who had had some previous experience but needed short periods of training to qualify them for employment in defence industries.

In the early fall additional federal appropriations were made for continuing the program started during the summer, and federal funds were also provided for equipment for industrial schools, for the training of NYA workers in the public vocational schools, for the preparation of rural youth for defence industries and for the establishment of short intensive technical courses in the engineering colleges. As the vocational schools were fully occupied during the daytime by the regular day school students, the defence classes were scheduled for the late afternoon and the evening, with many schools operating all-night shifts following the close of the evening session. Primary attention was given to the machine tool and aircraft industries, although many courses were offered in shipbuilding, automotive repair, electrical maintenance, building construction and other fields. Many secondary schools which previously had offered no vocational training started defence classes, and many new schools designed primarily for defence training were being planned at the close of 1940.

Although national defence occupied the centre of attention during the year, vocational education programs in other fields continued to expand, in numbers of schools and in enrolments. Increased attention appears to have been given to closer correlation between various types of vocational programs, such as those of business and industry. In the field of agricultural education much was done in the evaluation of programs, in farm surveys to get at the needs of farm youth and in other aspects of research.

Training for the distributive occupations increased greatly, and many new courses were offered in the training of persons for public service occupations. Numerous programs of training for diversified occupations were developed or expanded. In the field of homemaking, preparation for family life received continued emphasis, but considerable attention was also given to the preparation of girls for occupational life outside the home, in such fields as public foods service.

The trend toward higher age and grade levels of pupils in vocational schools seemed to be continuing, with increased interest in vocational work on the junior college or technical institute level. State and local programs of occupational information and vocational guidance continued to grow in extent and importance. Federal appropriation for vocational training for NYA project workers through classes in the public vocational schools served to bring closer together the functions of the NYA and public schools toward the end of a more unified program for out-of-school youth.

(L. A. E.)

Great Britain.—Many technical colleges were engaged in providing parts for war industries, but care was taken everywhere strictly to subordinate the productive effort to the training, the scope of which was not narrowed. The recommendations of the Spens report were put into operation at the Belfast College of Technology. The day schools have been styled the technical high school and they provide a good general education in literary subjects, together with educational courses in science, art, commerce and technical training.

The national council on commercial education discussed post-war policy at its conference and was to make a careful investigation of conditions before recommending action. The board of education acknowledged that satisfactory accommodation was one of the most pressing educational needs, since in the absence of fully adequate accommodation and equipment the schools could not make the contributions that they should to national efficiency in industry and commerce. It was recognized that the reconstruction of the trade of the nation after the war would intensify the demand for proper equipment and training. The European war has not swept away the excellent facilities for education provided by many business houses, and new business training scholarships were established by the Dunlop Rubber company.

The police laboratories at Birmingham, Cardiff, Nottingham and Preston contributed substantially to the efficiency of the service, and a similar centre was proposed for Wakefield.

British Dominions.—A. Abbott again urged the government to expand and strengthen the system of technical and commercial training in India. Some 4,000 technicians were required as first step, and much still remained to be done if the immense natural resources of India were to be fully utilized for the benefit of her increasing population.

(T. BE.)

Education Association, National: see NATIONAL EDUCATION ASSOCIATION.

Eggs. Oct. 1940 production of eggs in the U.S. broke all previous records for that month, 2,215,000,000 eggs, which was 8% higher than October production in 1939 and 18% above the ten-year (1929–38) average for that month. The number of laying hens on U.S. farms in Oct. 1940 was 279,074,000, practically the same as a year earlier, but the laying rate per hen in Oct. 1940 was higher than ever before for that month, 794 eggs per hen compared to 736 for the same period in 1939 and 670 for the ten-year average in October. The laying rate for the heaviest production month, April, was 1,652 eggs per 100 layers in 1940 as against 1,699 in 1939, the ten-year average being 1,664. Laying hens on U.S. farms at the end of 1940 were placed (preliminary estimate).

by the department of agriculture) at 5% under the number at the close of 1939, when there were 326,000,000 layers. Fewer pullets were kept for replacement in 1940. On Nov. 1 the number of pullets in farm flocks and not yet of laying age was estimated at 2% lower than in 1939. Egg production in 1940 was practically at the same level as in 1939. Although production the first ten months of 1940 showed a slight increase, 34,843,000,000 eggs compared to 34,168,000,000 in the first ten months of 1939, the slightly smaller laying flocks in November and December evened up the comparative figures. Total production for the 12 months of 1939 was 38,225,000,000 eggs. The ten-year average was 36,341,000,000. Eggs accumulate in cold storage during the months of heaviest production to a peak in August, when production begins to decline more rapidly and storage eggs move into consumption. Holdings of cold storage eggs Aug. 1, 1940, were 7,784,000 cases of shell eggs (30 doz. to the case) and 4,427,000 case equivalent of frozen eggs, compared to 7,024,000 cases of shell eggs and 4,125,000 case equivalent of frozen eggs Aug. 1, 1939. The Aug. 1940 holdings included 1,067,522 cases of shell eggs owned by the Federal Surplus Marketing administration for relief distribution. The Surplus Marketing administration's predecessor, the Federal Surplus Commodities corporation, held no storage eggs a year earlier. The government made in 1940 for relief distribution its heaviest purchases of eggs of any year, buying in all approximately 70,000,000 doz. at prices ranging from 5½ to 19 cents. During spring and summer, market prices paid producers ruled around 16-cent levels, about the same as in 1939. Owing to increased industrial activity and expanded consumer buying power, market prices more than doubled from August to December. Egg futures on the Chicago Mercantile exchange registered in November a two-year high. (See also POULTRY.)

(S. O. R.)

Egypt. An independent kingdom of northeast Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Libya and the Sahara. Area c. 383,000 sq.mi. (arable land 13,600 sq.mi.); pop. (census, 1937) 15,904,525. Chief towns (pop. 1937): Cairo (cap., 1,307,422); Alexandria (682,101); Port Said (126,907); Santa (94,421); Mansura (68,637); Damanhur (61,791); Asyut (59,925). Ruler, King Farouk I; premier, Hussein Sirry Pasha (Nov. 14, 1940); language, Arabic; religion, Mohammedan 91%; Copt 7%.

History.—Although Egypt did not escape the impact of the war, the year 1940 was, relatively speaking, a tranquil one.

From the military point of view there was the occupation of Egyptian territory by the Italians, who, advancing across the Libyan frontier, occupied Sollum on Sept. 13 and Sidi Barrani on Sept. 16. Also Alexandria suffered several air raids, the first being on June 22. Suez and Port Said also each had a raid, but in no case was any serious damage done and the casualties were always small. Beyond this the war had no other direct effect on the country though its repercussion was felt in the political arena. Aly Maher Pasha, who had assumed office on Aug. 18, 1939, was compelled to tender his resignation on June 22 owing to the difficulties which had arisen in connection with the interpretation of the Anglo-Egyptian treaty of alliance. He was succeeded on June 28 by Hassan Sabry Pasha. Himself an Independent, Sabry Pasha managed to persuade the Liberal-Constitutionals to accept seats in the new cabinet, which, comprising also the Saadists and 'Itihadists and leading Independents, was more representative of the country than its predecessor.

Following Hassan Sabry Pasha's accession to power, Sir Ahmed Hassanein Pasha, the well-known explorer and first chamberlain to the king, became the king's political adviser as head of the

royal cabinet on July 27.

As soon as the various controversial questions left outstanding had been liquidated, Sabry Pasha considered that the time had come to broaden the basis of his cabinet by including some of the followers of Nahas Pasha, the leader of the Wafd. His efforts were, however, in vain. He reconstructed his cabinet on Sept. 2 to enable himself to hold the portfolio of the interior in addition to foreign affairs.

On the declaration of war by Italy, Egypt broke off her relations with that country (June 12). The government took no further action beyond accelerating the reorganization and increase of the army and the passive defence system. Parliament decided, under the Aly Maher cabinet (June 12), confirmed soon after Sabry Pasha succeeded him (Aug. 21), that, while respecting the terms of the Anglo-Egyptian alliance and doing everything within her territory to furnish her ally with all aid necessary, Egypt would only participate in the war if she were attacked. With the Italian advance into Egypt, Dr. Ahmed Maher Pasha, the Saadist leader, and his colleagues were of the opinion that the conditions laid down by parliament had arisen, and on the majority of the cabinet deciding against any declaration of war on Italy, resigned. On Nov. 14 the premier died suddenly and his office was assumed by Hussein Sirry Pasha, the minister of works and an Independent, who took an early opportunity of confirming his predecessor's foreign policy and of pledging his government's continued support of the Anglo-Egyptian treaty. The question of entry into the war was obviated by the British advance on Dec. 9 which succeeded in practically driving the Italians out of Egypt within a week.

The economic situation was satisfactory. Two important factors conduced to this. The presence of continually-increasing British forces in the country brought into circulation a considerable amount of money which benefited all classes of the community. The British government's undertaking to purchase the

"BIG BRAVE BENITO" thought he had the lion whipped in Africa until Dec. 1940, but Shoemaker of the *Chicago Daily News* didn't give him much credit

ITALIAN COLONIAL TROOPS advancing on El Sollum, Egypt, shortly after launching the long-delayed Egyptian campaign Sept. 12, 1940. Thousands of these troops were captured in the British counteroffensive which began Dec. 9

Agriculture and Minerals.—Production 1938 (in metric tons): cotton, ginned 494,500; maize 1,570,700; wheat 1,250,200, (1939) 1,333,800; rice 725,200; petroleum 225,700; phosphate rock 45,400; cane sugar, refined 209,000; barley 232,700, (1939) 238,200; ground-nuts 15,600.

Eire. Eire is the southern portion of an island to the west of Great Britain, extending from 51°26' to 51°21' N., and from 5°25' to 10°30' W. Under the constitution, operative since Dec. 29, 1937, the name "Irish Free State," given by the treaty of 1921 to the 26 counties and four of the county boroughs of southern Ireland, was replaced by that of "Eire," or Ireland. President: Dr. Douglas Hyde (*de h-Ide*). National flag: the tricolor of green, white and orange.

Area and Population.—Area 26,601 sq.mi.; pop. (est. Jan. 30, 1939) 2,934,000. Chief towns (pop. census 1936): Dublin (cap., est. 1939, 482,300); Cork (80,765); Limerick (41,061); Dun Laoghaire (est. 1939, 40,600); Waterford (27,968). Languages: Irish and English; religion: Christian (Roman Catholic 93%).

History.—By Jan. 3, 1940 the government had recovered about 900,000 out of 1,084,000 rounds of ammunition taken at Christmas from the Dublin magazine fort, and most of the remainder was later recovered.

As a result of a high court decision declaring unconstitutional the Offences Against the State Act, 1939, amending legislation was rushed through the Oireachtas on Jan. 3, and submitted to the president, on the advice of the council of state, to the supreme court which on Feb. 9 pronounced it not repugnant to the constitution.

On Feb. 24 ten prisoners held under the new law went on hunger-strike. One of them died on the 17th day of the strike; another on the 19th, whereupon the strike collapsed. On Apr. 24 an attempt was made to blow up Dublin castle, and on May 24 two detectives guarding mails were attacked and severely wounded. The Emergency Powers act was further amended on June 26 so as to give military courts jurisdiction over civilians. Under this legislation two men were tried for the murder of a detective in an affray on Aug. 16, and, after vain appeals to the ordinary courts, executed on Sept. 6.

The war has led to the practical cessation of party politics. By-elections have been postponed by consent, and on May 16, after the army had been put on a war footing, a National Defence council was formed representing the three main parties. On July 16, at a great recruiting rally in Dublin, Messrs. de Valera and Cosgrave appeared on one platform for the first time since 1911. Meanwhile de Valera, while on May 11 he protested against the invasion of Holland and Belgium, made it clear in an interview on July 5 that Eire intended to remain neutral, and rejected proposals for all-Ireland defence except on a basis of unity and neutrality.

Most important defensive measures have been the expansion of the army, the rapid enrolment of a local defence force, now numbering over 100,000, the establishment of emergency parish committees and the appointment of regional commissioners to take care of supplies. (M. T.)

Education.—In 1937–38: elementary schools, 5,166; scholars 469,925; secondary schools 336; scholars 36,092; universities, National 4,422 students; Trinity college, Dublin 1,489. (See also EDUCATION: *British Empire*.)

Banking and Finance.—Revenue, ordinary (1939–40) £3,454,000; (est. 1940–41) £33,718,000; expenditure, ordinary (1939–40) £34,395,023; (est. 1940–41) £35,584,000; public debt (March 31, 1940) £50,918,000; notes in circulation (Aug. 1939) £16,058,921; gold bullion (March 31, 1939) £1,991,681.

Egyptian cotton crop resulted in an easing off of the agricultural position since the decision was taken at a time when the bulk of the crop was still in the hands of the growers.

Three important financial decisions were taken during 1940, the extension of the charter of the National bank together with the monopoly of the note issue for another 40 years as from Aug. 12, the transformation of that bank into a Central bank on the same date, and parliament's approval of the liquidation of the Public Debt commission (July 17).

The suppression of this international body had been accepted by England and France, but still needed the acceptance of Italy. When the latter became a belligerent, however, the liquidation was carried out without its assent.

In February, Aly Maher Pasha, the first prime minister to set foot on Sudanese soil since the reconquest, paid a visit to Khartoum on the invitation of the governor-general, Sir Stewart Symes.

A second daughter (Princess Fawzieh) was born to King Farouk and Queen Farida on April 7. (A. MN.)

Education, 1936–37.—Elementary and secondary: government schools 4,795; scholars 930,248; high schools: government 6; scholars 1,123; Fuad I university: scholars 8,150; foreign schools 410; scholars 76,750.

Banking and Finance.—Revenue (est. 1939–40) £E.40,247,000; expenditure (est. 1939–40) £E.41,847,000; public debt (May 1, 1939) £E.94,614,360; reserve from budget surpluses £E.33,062,569; notes in circulation (Aug. 31, 1939) £E.22,200,000; gold reserve £E.6,500,000; net profit of the National bank (1938) £E.474,640, (1939) £E.379,651; exchange rate (£E.1=100 piastres): 97½ piastres=£1 sterling.

Trade and Communication.—External trade (merchandise): imports (1938) £E.36,934,373, (1939) £E.34,091,000; exports (1938) £E.29,342,486, (1939) £E.34,081,000; re-exports (1938) £E.782,528. Communications and transport, 1938: roads, main 1,240 mi.; secondary 3,430 mi.; railways, state 3,537 mi.; agricultural 876 mi.; shipping 60,495 tons gross; entered ports 35,390,325 tons gross; passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1938): cars 29,382; commercial 4,074; cycles 2,051; wireless receiving set licences (Dec. 31, 1938) 78,823; telephone instruments in use (April 30, 1938) 59,922.

Eisen, Gustavus Augustus (1847–1940), Swedish-American archaeologist and anthropologist, was born in Stockholm, Sweden, Aug. 2. Graduated from the University of Uppsala in 1873, he went to the United States in October of that year and later worked with the United States department of agriculture. He agitated successfully for the preservation of the sequoia trees in California and engaged in anthropological explorations in Spain, Italy, Algeria, Tunis, Morocco and Egypt. He devoted some time to the study of the Chalice of Antioch and the possibility that it was the Holy Grail.

He was the author of more than 100 books and papers dealing with antiquarian and anthropological subjects. He died in New York city, Oct. 29.

Elections. In the elections of 1940 the contest of pre-eminent interest was that for the presidency. During the early pre-convention manoeuvres the leading aspirants for Republican nomination were Thomas E. Dewey and Robert Taft. Wendell L. Willkie, though entering the field later, gained quick recognition as a potential dark horse. When the Republican convention opened at Philadelphia on June 24, he had few pledged delegates; but as his two chief rivals approached stalemate, his position improved; and on the sixth ballot he was nominated. Senator Charles L. McNary was then chosen as candidate for the vice-presidency.

In the Democratic fold several names had been plausibly mentioned, but only two—John Nance Garner and James A. Farley—openly admitted their candidacy. Others, more coy to the honour, would not put themselves forward while Roosevelt's intentions remained in doubt. And this doubt was not resolved until July 16 when, after the Democratic convention had assembled at Chicago, the president declared his willingness to stand for a third term. After this declaration his nomination was mere routine. Some opposition arose, indeed, against his designated choice of Henry A. Wallace as a running mate; but this opposition was quickly overcome and Wallace received an adequate majority on the first ballot.

In the campaign that followed, discussion centred most promi-

nently upon the war and its relation to the United States. Yet no fundamental differences were voiced by the two principal candidates upon this subject. Both favoured a vigorous defence program and all possible aid to Britain "short of war." Roosevelt had the advantage of position, which enabled him to counter verbal attacks with dramatic action—as when he announced that fifty over-age destroyers would be given to Britain in exchange for the lease of certain sites for naval bases. Willkie could hardly disapprove the substance of this transaction although he criticized the manner in which it was arranged.

On domestic issues there was almost as little avowed disagreement. Willkie declared himself in favour of retaining the main features of New Deal meliorative legislation, promising only that, if he were elected, he would give it more efficient and impartial execution.

The press lined up heavily on the Republican side, and a number of papers and individuals formerly prominent in the Democratic party went over to the opposition. A notable defection was that of the normally Democratic but always conservative *New York Times*. More remarkable, on the other hand, was the decision of the independent *St. Louis Post-Dispatch* to support Roosevelt after having opposed him in 1936 and having vigorously denounced his policies in 1940.

It is impossible to determine what considerations finally prevailed with the voters. No doubt a general disinclination to change leadership in the midst of a crisis had much weight. And apparently the long fostered tradition against a third term was less deeply seated than some Republicans had wishfully imagined. The various straw votes, particularly that conducted by George Gallup, tended to show a considerable fluctuation of opinion from week to week. One may, however, question whether this seeming inconstancy was really in the attitude of the electorate or merely in the samples taken since it usually kept well within the tolerance for error assumed by Dr. Gallup. But, whatever the facts may have been, the ultimate ballot ratios came very near to those forecast by some political analysts in 1939: 27,245,422 or 54.7% of the total popular vote and 449 electoral votes for Roosevelt to 22,333,801 or 44.8% of the popular vote and 82 electoral votes for Willkie. Among the minor tickets entered it may be observed that Norman Thomas, the Socialist candidate, received only 116,796 popular votes; Earl Browder, the Communist candidate, only 48,789; Roger Babson, the Prohibitionist candidate, only 58,600; and all others only 15,274.

The general elections left the party balance almost unchanged. In the house of representatives the Democrats gained 6 seats, giving them 268 members to 162 Republicans, 3 Progressives, 1 Farmer Laborite, and 1 American Laborite. In the senate the

ICKES, HOPKINS, ET AL. saw to it that President Roosevelt's "curfew should not ring tonight," in this cartoon by Carlisle of the *Des Moines Register*. The third term was a favourite subject for U.S. cartoonists in 1940

Republicans gained 3 places (not counting 1 Farmer Labor member who was returned on the Republican ticket); but the Democrats retained their control with 66 members to 28 Republicans, 1 Progressive and 1 Independent. Of the 35 governorships at issue during 1940 the ratio remained substantially as before—18 Democrats to 17 Republicans (barring recounts) or a gain of 2 states for the Republicans.

Schedule of Elections.—Presidential elections in the United States are uniformly held on the Tuesday after the first Monday in November in years designated by multiples of four. Congressional elections are held on the same or corresponding day in even years by all states except Maine, which adheres to its old custom of holding elections on the second Monday in September. Governors are elected in even years on the same day as members of congress in 22 states: Arizona, Arkansas, Colorado, Connecticut, Georgia, Idaho, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, North Dakota, Ohio, Rhode Island, South Dakota, Tennessee, Texas, Vermont and Wisconsin. They are elected quadrennially at the same time as the president in 10 states: Delaware, Florida, Illinois, Indiana, Missouri, Montana, North Carolina, Utah, Washington and West Virginia; quadrennially at the congressional elections between presidential years in 10 states: Alabama, California, Maryland, Nevada, New York, Oklahoma, Oregon, Pennsylvania, South Carolina and Wyoming; quadrennially on the corresponding day in the years immediately preceding presidential elections in 2 states: Kentucky and Mississippi; quadrennially on the corresponding day in the years immediately following presidential elections in 1 state: Virginia; triennially on the corresponding day in 1 state: New Jersey. Louisiana chooses its governor quadrennially in presidential years on the third Thursday in April; and Maine, biennially at the same time as she selects her congressmen. (See also DEMOCRATIC PARTY; ELECTORAL VOTE; REPUBLICAN PARTY; UNITED STATES and under various state articles.) For elections in other countries see under the name of the country. (G. P. BA.)

Electrical Industries. National defence preparations made 1940 a year of superlatives for the electrical industry. Never before had output of electricity grown so fast, or orders for electrical apparatus or purchases of generating equipment increased so greatly, as in the last six

months of 1940.

The December peak week just missed reaching 3,000,000 kw.-hr. output. The lowest week of the year (July, 4th week) was larger than the largest week in 1929 by 20%. The result was a record output for the year of 144,600,000,000 kw.-hr.

New generating capacity in the U.S. totalling 1,850,000 kw. was placed in service in 1940. Scheduled for delivery in 1941 was 4,000,000 kw., and for future years nearly 3,500,000—a total stimulated primarily by defence of 9,500,000 kw. The delivery of new steam generating equipment in 1941 for utility use will be the largest on record.

Of the new 1940 capacity, steam made up 70%, hydro 28% and internal combustion 2%. In Canada, on the other hand, hydro with 227,000 kw. accounted for most of the gain.

The average hours' use of fuel capacity in 1940 exceeded 3,000 hr. for the first time, going to 3,251 hr., thus reflecting the double shift industrial operations.

Because of rearmament, industrial sales dominated the electrical business. Nevertheless, there were 1,000,000,000 new residential customers. Average residential usage continued to grow and at the end of the year stood at 952 kw.-hr., at an average rate below four cents for the first time.

Expenses were in line with increased revenue as shown by the operating ratio which remained fairly steady at 37.5%. Taxes, on the other hand, took a jump that was twice that of any previous year. The increase of \$65,000,000 brought the total utility tax bill up to \$405,000,000, or approximately 18 cents out of every dollar of revenue for taxes.

Close to \$600,000,000 were spent for new capital additions: \$240,000,000 were budgeted for 1941. Generating capacity gets 42%, while transmission, distribution and substations get 53% of the 1941 construction dollar.

In spite of the large capital expenditures in 1940, only \$400,000,000 worth of new securities was floated.

Manufacturers' sales reflected the defence buying and, exclusive of appliances, amounted to \$1,800,000,000, or just under the peak year of 1929. Sales booked were the largest on record, resulting in a record backlog carried over to 1941. Electric exports increased 27%. Electric appliances had a big year. Refrigerators nearly equalled the previous peak. Ranges at 450,000 units were the best ever, as well as water heaters at 125,000 units.

In lighting, the big advance was in fluorescent. Sales expanded faster than manufacturing capacity. Almost all production was power-factor corrected. High general lighting values with fluorescent, some up to 85 foot-candles, were recorded. An evaluation helped to restimulate street lighting so that it is once more on the up trend.

In engineering the trend toward improved service reliability was continued in more reliance on wood insulation, advances in grounding, differential protection, large air circuit breakers and field apparatus testing.

New generating capacity which for a few years had been largely super-positive turned 1940 back to condensing units. The forced circulation boiler for utility plants in the U.S.A. was ordered.

A trend toward economy in distribution practice was very evident with self-supporting residential cables, large orders for capacitors and regulators.

Rate reductions aggregated approximately half the amount of 1940.

Public ownership continued to expand in 1940, but almost entirely in territory where there was a federal project. Outside such areas the population going to municipal ownership totalled but 27,000.

Above, left: **ELECTRIC COUPLING** which transmits diesel power to a ship's screws without conveying the engine's vibrations. This coupling, which operates as a motor, was first tested on a cargo vessel Feb. 9, 1940

Below: **TESTING RACKS** of fluorescent lamps. Production of this new type of lighting increased greatly in 1940

In Washington, Nebraska and Alabama considerable privately owned utility property was sold to public utility districts. The year 1941 was expected to show even larger inroads.

No new government projects were started in 1940, but an additional \$65,000,000 were granted TVA under the plea of defence requirements. St. Lawrence came up again, this time purely as a power project. Canada voiced its willingness to go along. It will be put up to congress in 1941. Power improvements in the White river in Arkansas and Savannah river in Georgia were proposed.

Several important precedents were set by the courts, the most important of which was the supreme court decision in the New River case, giving jurisdiction to the federal government over virtually every stream by defining "navigability" as possibility of being made navigable.

Utilities were given the legal right to severance values where a public body wanted to buy part of a property; rural telephone companies were denied the right to enjoin rural co-ops from inductive interference; municipalities were denied damages because power companies tried to enjoin PWA operations; a state was denied the right to file an injunction against the construction of a federal hydro project.

A power grid was proposed to interconnect the eastern and middle west munitions areas. As 1940 closed, a report was expected. In the meantime several hundred miles of high tension interconnections were built and more were on the books for 1941.

All of the larger holding companies were cited to show cause why they should not comply with the integration provisions of the Holding Company act. Proceedings started. In several instances consolidation of intermediate holding companies with subsidiaries was voluntarily undertaken.

Some plans, but no action, for integration of large systems were announced.

Money was available for utility financing at a lower rate than ever before, several issues yielding less than 3% and one down to 2½%. Two sizable common stock issues were sold—the first of any consequence since the crash of 1929.

Federal Power commission made it evident that it expected early compliance with the demand for historical costs. Subsidiary properties were denied new financing which did not provide for substantial stock sales to the public. Private sales of security issues were frowned on. Interlocking directors and officers of holding companies and service companies were ordered terminated.

Canada.—Canada also had a year of record demands for electricity. In spite of reductions in sales of secondary power for export and for use in electric boilers, a new record total of something in excess of 30,000,000,000 kw.hr. was generated.

Europe.—Data from Europe on power generation were not available. It was known, however, that due to black-outs, fuel and lighting restrictions and priorities the consumption of electric energy in Europe was below that for years prior to the European war.

Electric Lighting. **Light Sources.**—Upon the basis of 1938 figures taken as 100% the United States consumption of filament lamps increased in 1940 to 117%, the dollar value to 121% and the wattage to 131%. The increase in the United States of electric power consumption by some 9.4% over 1939 and nearing 2,800,000,000 kw.hr. per week was reflected in lighting consumption, it being estimated that some 35% more lumens were generated electrically in 1940 than in 1938.

The United States consumption was some 600,000,000 large

CHART of the evolution of modern lamps up to 1940

lamps, and 286,000,000 miniature lamps exclusive of Christmas tree types. Of the latter the consumption was 175,000,000 which some 65,000,000 were imported. Production of Christmas tree lamps of the 6-volt design, 20 in series, was introduced to standardize this usage. Some 2,000,000 sealed beam automobile head lamps were installed, improving night motoring. No American practice centred on the 5-in. sealed head lamp and new localized beam fog lamp. In the United States some 12,000,000 photoflash lamps were consumed in photography, the chief innovation being the midget 1½-in. bulb rated at 1,200,000 lumens.

The fluorescent tubular lamps made some progress in western Europe but in North America expanded 400% over 1931. During 1940 the price was reduced 35%; the life lengthened to 2,500 hours and the efficiency increased 41%, averaging 45 lumens per watt. The 100-watt 60-in. lamp, a 14-watt 15-in. lamp and a 6-watt 4-in. lamp were added. Extended usage developed with 250-watt R-40 bulb reflector-neck drying or infrared lamps in industrial processing, utilizing chiefly the 12,000 angstrom energy. Further progress in North America was made toward 120-volt lighting standardization, with the manufacture of many auxiliary devices centring at 118 volts. Prices of regular filament lamps decreased in the United States to 13 cents for wattages up to 75-watt inclusive and 15 cents for 75- and 100-watt sizes.

Greater interest developed in bactericidal or short wave ultraviolet, in killing pathogenic organisms chiefly in air and in preserving meat and other foods. Experimentally a continuous spectrum tellurium vapour lamp and a 10,000-watt water-cooled mercury vapour lamp were demonstrated—this, with the excitation of the positive carbon arc crater, being the brightest made source. Postponement of any international lighting standardization or application principles and the holding in abeyance of the International Congress of Illumination halted many of the records of lighting development in the eastern hemisphere.

Lighting Applications.—Black-out precautions in European cities increased, using masked street lighting units producing roadway intensities on the order of 1% of moonlight, coincidentally with the usage of screened mercury vapour lamps, in the range of 100 watts, emitting "black light" or 3,600 angstrom energy. With the latter were used many types of fluorescent and phosphorescent signs and danger markers. In America increasing interest developed in fluorescent carpets, fabrics and printing, in conjunction with "black light" for cinema and assembly halls. Industrial lighting in western Europe, chiefly with filament lamps, expanded rapidly but all other types of lighting suffered great shrinkage.

The second year of the New York and San Francisco world's fairs emphasized decorative possibilities of exterior lighting with a higher percentage of fluorescent and mercury vapour lamps, usage of the latter expanding in the United States through the installation of some 1,100 of the 250-watt size in seven miles of tunnels on the Pennsylvania turnpike. The remarkable growth of fluorescent lamps in North America reached an estimated volume of 6,000,000 with the 48-in. 40-watt lamp the most

popular. The white fluorescent lamp of 3,500° K colour temperature supplanted the 1939 "white" of 2,800° K, and was followed in demand by the 6,500° K daylight colour, while a new orchid tint, "soft white," extended applications to food retailing and department stores. In residences in the United States the average connected lighting wattage exceeded 1,300 with some 28 lamp sockets, 5.9 portables; or an average of 18 lighting fixtures. Home lighting lamp bulbs averaged 52 watts; the I.E.S. type of portable lamp averaged 120 watts. Night baseball was established by illuminating typical parks each with 200,000,000 c.p., from some 800 floodlights and using 1,500-watt filament lamps. Lighting intensities with fluorescent sources established new levels upward of 35 ft.-candles with a tendency toward the operation of twin lamps on a single ballast reactor, reducing flicker. (See also ELECTRICAL INDUSTRIES.) (S. G. H.)

Electric Transmission and Distribution.

The year 1940 was characterized by a considerable expansion in facilities, especially in power distribution systems. This is in marked contrast with the depression years when the continually increasing household-appliance load was accommodated by decreased industrial load and by using every contrivable means, such as induction regulators, capacitors or power-factor correction and tap-changing transformers, to increase the power capacities of existing circuits. Although these economies continued to be utilized, the increased demand for power made necessary the installation of new lines and equipment and in some cases extensive redesign of distribution systems. There has been an increasing tendency to put distribution circuits underground, but the war experience in Europe seemed to indicate that underground circuits can be badly damaged by bombs and that the subsequent repair of aerial circuits can be carried out much more quickly and more easily. Outdoor unit-type substations of various capacities and voltages were gaining in popularity and, in order to supply temporary loads or to care for new loads while permanent substations could be constructed, portable substations mounted on automobile trailers were being used.

Although there was very little legal pressure upon power companies to give attention to interference to radio reception on account of noises caused by distribution circuits, some companies were considering it a matter of public courtesy to do what they could within reason to decrease this interference. In some cases new insulators especially treated to prevent "sizzling" and "frying" replaced the older ones and the sections of line thus immunized were isolated from the other sections by the use of series inductive filters or shunt capacitive filters.

The high-tension transmission lines of the United States came into being one by one as means of carrying power from distant power sites to metropolitan or industrial centres. As the individual systems have grown and have approached each other, interconnections among the systems have been made until in 1940 the country was honeycombed with a network of high-tension transmission lines. The defence program under way made it pertinent to ask whether this network is adequate in transmitting capability and whether it has the requisite invulnerability for war-emergency conditions. Studies show that both of these requirements have been satisfied over the thickly-settled portions of the country. Several additional tie lines were being constructed in 1940 to strengthen further the dependability and flexibility of the network. The most notable of these was the 277-mi., 161-kv. link under construction in 1940 to connect the well-integrated systems of Washington, Oregon and Montana with those of Utah and Idaho. The new line runs from Anaconda, Mont., to Grace, Ida. and was to be completed at the beginning of 1941.

Several high-tension lines were completed during the year. Among these was the 147-mi. line of the Commonwealth Edison company from its Powerton generating station to the Crawford station in Chicago. Except for a short section near Chicago, this line is of single-circuit three-phase construction with 900,000

circular-mil aluminium cable steel reinforced, protected by two copper-coated steel ground wires. At the Chicago end is a 75,000-kva. synchronous condenser, the largest ever built.

The longest of the lines completed during 1940 was the 234-mi., 230-kv. line from Bonneville to Grand Coulee in the Pacific northwest. Construction was begun in Aug. 1939 and the line was finished in almost exactly one year. Right of way for a second line to parallel this one has been purchased and this second line will be undertaken when power is available at Grand Coulee dam. A line 183mi. long from Grand Coulee to Puget sound has been authorized for immediate construction. A 41-mi. section of 230-kv. line from Vancouver to Kelso, Wash., and a 30-mi. section from Kelso to Chehalis have been completed and the third section, terminating at Tacoma and Seattle, will deliver Bonneville power to the Puget sound area early in 1941.

Operating experience with the single-circuit 230-kv. Boulder dam line of the Southern California Edison company is of special interest because of its inexpensive construction relative to the cost of a double-circuit line. It is 233 mi. in length, is protected by two zinc-coated steel ground wires and Petersen coils (ground-fault neutralizers) at both ends, and has counterpoises at all tower bases where the tower footing resistance exceeded 100 ohms. In about one and one-half years of service there has been only one interruption while the line has operated as a base-load source delivering 165,000 kw. at a load factor of 97%. During 1940 this line was extended from the Chino substation to the Barre substation, a distance of 26mi., where it ties in with the Big Creek system through existing 66-kv. lines which will be replaced by a 230-kv. tie line. (See also RURAL ELECTRIFICATION.)

Electric Transportation.

In 1940 there were 20 cities throughout the world having either subway or elevated railway service. Those having subways were Barcelona, Berlin, Boston, Buenos Aires, Glasgow, London, Madrid, Moscow, New York, Osaka, Paris, Philadelphia, Sydney and Tokyo. Chicago had an extensive subway project under construction, and similar activities were reported from Munich and Prague. Cities having elevated railway systems included Chicago, Hamburg, Liverpool, New York and Philadelphia. Besides these there were services of a rapid transit character in a number of other places such as Cleveland and Vienna.

Elberfeld (Germany) had the distinction of having the world's only monorail elevated line.

According to the latest available figures there were about 7,500 trolley-bus vehicles in 1940 in a score of countries throughout the world. Great Britain and the United States were the leaders

†Total for five systems.

in this field, the former having some 2,600 such vehicles in operation and the latter approximately 3,000. Elsewhere there were about 1,300 additional trolley buses in operation.

Self-Contained Units.—In the 1920s an entirely new type of electric transportation vehicle was developed, called a "gas-electric" bus. In this design an electric generator was connected directly to the gasoline engine of the bus to provide electrical energy for motors which drove the rear wheels. Thus the primary source of the electrical energy was on the vehicle itself and no system of overhead wires or contact rails was necessary to connect the vehicle with a fixed generating station. With the development of the diesel engine came a great expansion of the electric-drive principle for buses. In 1940 there were about 1,700 gas-electric buses in operation in the United States and Canada and about 1,000 diesel-electric buses.

The electric-drive principle with both gasoline and diesel engines as the primary source of power has been widely employed also on trunk-line railroads. Many switching engines have been built with diesel engines driving electric generators. More recently in the U.S. the same type of power has been employed to haul crack high-speed passenger trains such as the "Zephyrs" operated by the Burlington, the "Rockets" of the Rock Island, the "Super Chief" of the Santa Fe, the "Streamliners" of the Union Pacific and the "Capitol Limited" of the Baltimore & Ohio.

Electrified Trunk-Line Railroads.—New developments in the field of electrified trunk-line railroad operation have been relatively few in recent years. While there are more than 6,000 mi. of electrified trunk-line track in operation in the United States there have been no important extensions since the Pennsylvania railroad completed the electrification of its main line between New York and Harrisburg. This lack of activity has been due to the high cost of constructing facilities for electric operation and to the popularity of the new trains operated by diesel-electric power. In Europe there had been, prior to the war, somewhat more interest in railroad electrification, due to the availability of hydro-electric power and the desire to cut down the use of fuels which had to be imported. Even there, however, the use of diesel power tended to retard expansion of railroad electrification.

Trends.—Before the advent of the automobile and the motor bus the electric surface railway provided by far the fastest and most comfortable transportation service in cities and adjacent communities. In recent years, however, its importance has declined, although it still remains the largest single agency of public passenger transportation. During 1940 the electric surface railways in the United States carried a total of more than 5,000,000,000 passengers, as compared with about 4,000,000,000 on motor buses engaged in comparable service, 2,500,000,000 on rapid transit lines and 500,000,000 on trackless trolleys.

Many studies have been made with a view to determining the logical economic field for the electric surface railway. Generally speaking it is agreed that the large investment in tracks, cars and electrical distribution equipment can be justified only where riding is sufficiently heavy to require frequent service. This condition does not ordinarily exist in small cities, and virtually all such cities that formerly had electric railways have given them up. For the same reason a great many of the interurban electric lines in sparsely settled territory have been abandoned.

Indications are that electric surface railways will not long remain an important factor in United States cities of less than 100,000 population. In cities between 100,000 and 500,000 the future of the electric railway cannot be predicted accurately at this time. About two-thirds of the 80 cities in the United States in this classification have retained electric railway service, while the other third rely upon motor buses or trackless trolleys or a combination of the two. In the cities of more than 500,000

population the electric surface railway continues to play an important part in local transportation, especially in those places which have little or no rapid transit service.

Trends generally similar to those in the United States were evidence elsewhere throughout the world up to the outbreak of war in Sept. 1939. London was contemplating the replacement of all its remaining tramway lines by trolley buses. Paris had already replaced all its trams by motor buses. Buenos Aires, with a relatively extensive subway system, was rapidly changing to buses for surface travel. On the other hand, such large cities as Liverpool and Glasgow, with rather limited rapid transit facilities, continued to rely largely on surface electric railways.

To what extent the war will ultimately affect the trends in cities in Great Britain and on the continent of Europe cannot be foreseen at this time. One effect already noted has been to retard plans for changing from electric railway to motor buses and trolley buses. This has been due partly to the difficulty of obtaining new vehicles from the manufacturers and partly to the difficulty of obtaining fuel for motor buses. Some transit systems are reported to have withdrawn motor buses and restored street railway service because of the fuel problem.

In the United States and Canada the belief has persisted among the transit companies in the larger cities that the electric surface railways will continue to perform a useful service. Since 1910 more than 1,500 modern streamlined electric cars have been purchased by transit companies in 16 major cities in those two countries.

Ellerman, Ferdinand (1869–1940), U.S. astronomer, was born in Centralia, Ill., May 13, and attended the University of Chicago where he became professor of astronomy. He assisted in planning the Yerkes observatory at Williams Bay, Wis., in 1896 and was one of those who equipped the Mount Wilson observatory in California in 1904. He remained with this observatory for 33 years. He died in Los Angeles, March 20.

Elliott, Harriet Wiseman (1884–), only woman member of the U.S. Advisory Commission to the Council of National Defense, was born at Carbondale, Ill. on July 10. After taking her bachelor's degree at Hanover (Ind.) college and her master's degree at Columbia university, she began teaching political science and history in 1913 at the University of North Carolina. In 1918 she was appointed a member of the Women's National Council of Defense and in 1928 she served as a member of the White House Conference on Children. She became dean of women at the University of North Carolina in 1935. Miss Elliott, who organized the first woman's suffrage movement in North Carolina shortly after completing her studies at Columbia, was appointed by President

Roosevelt May 28, 1940 to be commissioner for the protection of consumers' interests on the defence council advisory commission.

Elliott, Maxine (1871-1940), U.S. actress whose original name was Jessie Dermot, was born in Rockland, Me., Feb. 5. She was educated in Notre Dame academy, Boston, Mass., where she was advised to assume a stage name. She made her debut with E. S. Willard in 1890. She played in Augustin Daly's company for a time and became known more for her beauty than for her dramatic ability. She was popular and successful, however, appearing in a wide variety of plays from Shakespeare to modern comedy. In 1908 she became the owner and manager of a theatre in New York named for her. Her last appearance in the theatre was in 1920, after which she retired and built a chateau in the south of France. She died March 5, at her chateau in Juan les Pins on the Riviera.

Emery. Properly speaking, emery is a mixture of corundum and magnetite, though in some of the inferior grades much of the corundum is replaced by spinel and other minerals. The United States produced 765 short tons in 1939 and imported 1,956 long tons; imports rose to 5,105 tons in the first 9 months of 1940. The best emery comes from Greece and Turkey, each of which exports 10,000-15,000 tons annually. The Greek (Naxos) emery is considered best for grinding wheels, while Turkish is used for general polishing work and emery cloth. Grecian emery goes mainly to Germany and Netherlands, and Turkish to England. (G. A. Ro.)

Endocrinology. The knowledge of those hormones which are protein in structure has lagged behind that of the steroid hormones, because of the relative inadequacy of the methods for the isolation and purification of proteins in general. During 1940 the application of recently developed methods such as the use of the ultracentrifuge and the Tiselius electrophoretic apparatus, made possible the isolation of two of the protein hormones of the anterior pituitary gland.

Two laboratories (Shedlovsky, Fraenkel-Conrat) independently reported the preparation of a pure luteinizing hormone from the pituitaries of swine and sheep, respectively. The substances isolated have the physical characteristics of pure proteins and when tested in female animals give evidence of no other action but luteinization of the ovarian follicle. In the male animal this hormone causes hyperplasia of the homologous cells in the testis. For this reason these authors properly prefer to use the term interstitial cell stimulating hormone (I.C.S.H.) for this substance. This finally establishes the independent existence of I.C.S.H. (luteinizing) as a separate gonadotropic entity from the follicle stimulating hormone (F.S.H.) in the anterior pituitary gland, as previously postulated by Fevold and Hisaw.

The isolation of the growth hormone of the anterior pituitary gland was also reported by Fraenkel-Conrat *et al.*, although the purification of the material has not been perfected to as high a degree as in the case of I.C.S.H. However, only traces of thyrotropic, lactogenic and gonadotropic activity remain, and it seems probable that the growth substance is independent of the hor-

mones responsible for these effects. This separation removes the basis for the conception that the growth promoting action of anterior pituitary extract may be the resultant of the combined effects of the several trophic hormones which it contains, and lends weight to the findings of Freud *et al.* that the growth substance primarily affects the development of the epiphyseal centres of the long bones.

Anterior Pituitary Gland.—Uotila and co-workers continued their work on the mediation of the central nervous system in the activity of the anterior hypophysis. They previously reported that the pituitary stalk is a necessary pathway only for those endocrine reactions which are initiated by the stimulation of nervous receptors, but not for the maintenance of such functions as growth and the trophic influences of the anterior pituitary upon other endocrine glands. During 1940 they further showed that section of the pituitary stalk does not interfere with the action of oestrin in inhibiting the secretion of gonadotropic substances or in producing the typical histological reaction in the pituitary gland. Similarly, interruption of the nervous pathways to the pituitary did not prevent the atrophy of the thyroid gland following large doses of thyroxin, nor did it interfere with the regeneration of residual thyroid tissue after subtotal thyroidectomy. However, the inhibitory action of cold upon the reproductive cycle of rats was not manifested after section of the pituitary stalk.

The production by Young of permanent diabetes in dogs by means of prolonged treatment with large doses of an anterior pituitary extract was reported about 1938, and initiated several new avenues of research. It seemed possible that this type of experimental diabetes might more closely approximate diabetes mellitus in humans than does the classical type of experimental diabetes which follows pancreatectomy. However, it has since been shown that the pancreatic glands of such "pituitary-diabetic" animals exhibit a reduction in size and severe degeneration of the islets of Langerhans, and particularly of the Beta cells to which the secretion of insulin is attributed. From the evidence at hand in 1940 (*cf.* Soskin) it appears probable that the injected anterior pituitary extract evokes a secretion of insulin from the pancreas. The continued administration of increasingly large doses of the extract eventually exhausts the insulin-secreting cells of the pancreas, and apparently permanently incapacitates them. Thus when the treatment is discontinued, the animal's condition closely resembles that of a depancreatized organism, except for the presence of those portions of the pancreas which are not concerned with insulin secretion.

Thyroid.—The general interest in the functions of the anterior hypophysis and the demonstration of the thyrotropic activity of pituitary extracts, tended to focus attention on the control of thyroid secretion by humoral mechanisms. Although the normal regulation of thyroid function may well be determined to a considerable degree in this manner, evidence is forthcoming which indicates that nervous intermediation of thyroid activity may be important in the pathogenesis of clinical thyroid disorders. It was shown by Friedgood and Cannon that in the occasional animal the continued stimulation of the cervical sympathetic nerve following its anastomosis with the right phrenic nerve, may result in a syndrome which duplicates the essential features of exophthalmic goitre in humans. Conversely, bilateral cervical sympathectomy was shown to significantly lower the basal metabolic rates of most of the animals in which the operation was performed (Brock *et al.*).

A beginning was also made on the application of radioactive iodine to the study of normal and abnormal thyroid function. Hertz *et al.* reported, that using this method in rabbits, the normal thyroid absorbed 80 times that amount of administered iodine

which might have been expected to enter the gland on the basis of a uniform distribution throughout the body. The hyperplastic thyroid took up from 300–400 times the distribution value. The curves of the uptake of iodine by hyperplastic thyroid glands differed according to the agent used to produce the hyperplasia. This suggests that there may be functionally different hyperplastic states of the thyroid.

Adrenal Cortex.—Since the earlier recognition that extracts of the adrenal cortex may not be regarded as containing a single active substance, a number of steroids and amorphous fractions have been isolated and identified. A study of the physiological properties of these substances revealed that the various compounds or fractions have certain activities in common. However, a particular compound or fraction may exhibit one activity to the highest degree and be relatively impotent in other respects. It was found convenient to compare the various cortical steroids and fractions according to the following effects obtained upon their administration to adrenalectomized animals (Kendall): (1) the maintenance of life, (2) the restoration of normal carbohydrate levels in all tissues, (3) the restoration of normal sodium and potassium balance and excretion. To these effects may be added the restoration of the ability of the muscles to continue to perform work in response to prolonged stimulation, according to the test developed by Ingle. However, the activities of substances in this respect run parallel with their carbohydrate effects.

During 1940 much of the earlier confusion as to the separation of the above actions was resolved by the demonstration that the factor which primarily affects the mineral balance also exerts a secondary action on the metabolism of foodstuffs. The secondary effects are most readily distinguished from the primary metabolic actions of adrenal cortical substances, by a consideration of those disturbances in the adrenalectomized animal which are alleviated by combating the mineral imbalance with a high sodium and low potassium intake alone. Such treatment was shown to restore to normal the diminished rate of glucose and of fat absorption by the intestine, and to enable adrenalectomized animals to deposit glycogen from glucose in a normal manner (Anderson). The primary metabolic functions of the adrenal cortex, as indicated by those metabolic disturbances in the adrenalectomized animal which persist despite the maintenance of a normal sodium and potassium balance, are concerned with the maintenance of normal carbohydrate levels in the blood and other tissues during fasting. This action of the adrenal cortex depends chiefly upon its influence over the rate of new formation of sugar from non-carbohydrate precursors in the liver. In this connection there is evidence that the adrenal cortex influences the catabolism of protein and the mobilization and catabolism of fat.

Pancreas.—An *in vitro* action of insulin was demonstrated by Gemmill. He obtained glycogen synthesis from glucose in the isolated muscle from rat diaphragm. In view of the increasing knowledge of the chemical mechanism of glycogenesis, Gemmill's observation should open the way to the elucidation of insulin action in this regard.

The mode of action of insulin in the intact animal was clarified by the work of Soskin and Levine. They had previously shown that, in the absence of insulin, the characteristically high blood sugar level of the diabetic animal enables it to utilize at least as much carbohydrate as the normal animal utilizes at its lower normal blood sugar level. During 1940 these authors reported on the effect of large doses of additional insulin on the sugar utilization of normal animals. They found that administered insulin does not increase the rate of sugar utilization although it does increase the storage of glycogen. Thus the amount of insulin available in normal animals is apparently sufficient for the maximal rate of glucose catabolism, but not sufficient for

maximal glycogen synthesis. They concluded that insulin is not primarily concerned with the oxidative breakdown of carbohydrate. It probably facilitates the formation from glucose of an intermediate substance (phosphorylated hexose?) which precedes and is necessary for both catabolism and synthesis.

Ovary.—The methods for studying the metabolism of surviving tissue slices *in vitro*, have been applied to the problem of the metabolic fate of the oestrogenic hormones. Heller showed that oestrone, which is secreted by the ovarian follicle, is changed to oestradiol by various tissues. Oestradiol is then broken down by oxidative reactions, primarily in the liver. When tested on castrate female animals, oestradiol is weight for weight about 10 times as effective as oestrone. Thus when the liver is damaged, the oestrone secreted by the ovaries is changed to the more potent oestradiol, but the latter is not broken down as rapidly under normal conditions. This probably explains why many patients with extensive liver damage tend to show evidence of increased oestrogenic activity, such as feminine distribution of hair and gynaecomastia.

It is known that the normal menstrual flow depends upon many factors. The cells lining the uterus proliferate under the influence of oestrin secreted by the developing follicle in the ovary. After ovulation has occurred the hormone of the corpus luteum further stimulates the uterine lining to cell proliferation and increased secretion by the uterine glands. Just before menstruation the uterine lining is thick, spongy and its blood vessels are dilated and filled with blood. It is prepared, therefore, for being shed in the menstrual flow. It is evident from the above that disturbances in the amount or quality of ovarian hormones may cause a cessation of menstruation, or amenorrhoea. There are, however, cases of amenorrhoea in whom no endocrine disturbances can be found. The therapy of such cases has hitherto been unsatisfactory.

Studies on the nature and mechanism of the oestrus cycle in animals showed that the hyperaemia of the uterus plays an important role in certain of the uterine changes during the cycle (Hechter, Lev and Soskin). This hyperaemia is normally brought about by the stimulating effect of oestrin on the local secretion of acetylcholine by the nerve endings of the autonomic nerves in the uterus (Reynolds). The presence and degree of the hyperaemia might, therefore, depend also on the state of the autonomic nervous system at the time of oestrin stimulation.

Since the degree of hyperaemia could well be a determining factor in setting off the menstrual flow in humans, it seemed possible that those cases of amenorrhoea without evident endocrine disturbances, might lack adequate amounts of the normal hyperaemic stimulus, acetylcholine. Accordingly, a group of such cases was treated with prostigmine, a drug which inhibits the destruction of acetylcholine in the body. This treatment uniformly restored the menstrual flow, and it had no effect whatever in cases of amenorrhoea due to pregnancy (Soskin *et al.*). (See also PHYSIOLOGY; ZOOLOGY.)

England: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature. During 1940 the effects of the war began increasingly to make themselves felt upon literature, and notably fewer serious books were published. After a year of war, however, quality had remained largely unaffected; and although the increase in book prices and the closing down or suspension of certain well known publishing houses were observed with regret, the defeat of a proposal to make books liable to the purchase tax was an encouraging sign for a somewhat uncertain immediate future.

Belles lettres, not surprisingly, suffered the most extensive eclipse. George Orwell's *Inside the Whale* was almost the sole representative of the critical essay, and G. B. Harrison's *Elizabethan Plays and Players* was the only important addition to the usually prolific field of historical dramatic criticism, although in *Rare Prologues and Epilogues* Prof. Audrey Wiley compiled a useful anthology of her neglected subject. Poetry appeared in little greater abundance, and T. S. Eliot's *East Coker*, a didactic introspection in his best manner, was the only new work of importance; although John Betjeman was as felicitous as ever in *Old Lights for New Chancels*, and Sean O'Casey full-bloodedly propagandist in *The Star Turns Red*. The deaths of Humbert Wolfe and W. H. Davies, both of whom possessed a fine sense of words and enjoyed, in their heyday, a considerable public repute, took place during the year.

History and historical biography enjoyed a good year. In *The Eighteenth Century Background* Basil Willey provided a subtle, acute and exceedingly interesting guide to the study of the period, while the publication of *Letters from George III to Lord Bute* (introduced by Romney Sedgwick) threw valuable light on a misunderstood relationship. A lighter aspect of the century was pleasantly sketched by Willard Connely in *The Reign of Beau Brummell*; and although R. W. Ketton-Cremer's *Horace Walpole* revealed nothing new about its subject, it usefully restated the old. Other periods were not so well covered; but one noticed Carl Burchardt's great life of Richelieu, H. W. Parke's erudite *History of the Delphic Oracle*, G. G. Coulton's *Studies in Medieval Thought*, Hugh Ross Williamson's entertaining *George Villiers*, Michael Prawdin's *History of the Mongol Empire* and Sir Percy Sykes's definitive *History of Afghanistan*. Among modern biographies were hagiographic studies of Oscar Wilde, Field Marshal Mannerheim and Neville Chamberlain, by Lord Alfred Douglas, Tancred Borenius and Derek Walker-Smith respectively. Autobiographies were few, and only Havelock Ellis's *My Life* and Gilbert Frankau's *Self-Portrait* were by writers distinguished enough to deserve much attention.

Politics continued, as might have been expected, to hold a disproportionately important place amongst the year's books. There was still little check to the spate of tracts against nazism, but amongst their very numerous company only F. Borkenau's *The Totalitarian Enemy* seemed to have the detached and analytical approach that raises political philosophy above political journalism. The best of the lower ranks was Douglas Reed's *Nemesis?*, an entertaining biography of Otto Strasser, Hitler's rival and former colleague. One must also remember Sir Neville Henderson's *Failure of a Mission*, an uninspiring account of the negotiations that preceded the war, which gained considerable importance by being issued with cabinet approval. Besides the conventional denunciations of Germany, there was also an equally numerous flock of pamphlets extolling the invincible Maginot line and the unconquerable spirit of France that it would be

unkind to particularize. It was too soon after the event to expect detailed explanations of the French collapse; and save for *The Last Days of Paris*, an exceptionally vivid piece of reporting by Alexander Werth, very little of value was published on this subject. The general political field received a good deal of attention, and the debate for and against federal union continued at full strength, with D. N. Pritt's *Federal Illusion* as the ablest of the opposition. H. G. Wells, too, continued to develop his scientific socialism in *The New World Order*, and William Gallacher, the communist M.P., made *The Chosen Few* an effective political testament.

General science was sparsely represented, but *The Naked Nagas* by Christoph Fürer-Haimendorf and *The Swazi* by Brian Allan Marvick combined travel, adventure and cultural anthropology in very readable proportions. Also in the anthropological category was Mass Observation's *War Begins at Home*, an excellently arranged study of the average man's reactions to the disturbing new problems of the first months of war.

Fiction, as usual, was exceedingly plentiful. L. H. Myers (*The Pool of Vishnu*), Graham Greene (*The Power and the Glory*), R. C. Hutchinson (*The Fire and the Wood*), Sinclair Lewis (*Bethel Merriday*) and Elizabeth (*Mr. Skeffington*) all published new novels worthy of their previous reputations, while in *The Bridge in the Jungle* the mysterious B. Traven once more demonstrated the possibility of selling half a million and remaining a good writer. Translations were unusually prominent, and Henri de Montherlant's *The Lepers* (sequel to that remarkable tour de force, *Pitié Pour Les Femmes*) and Hans Fallada's *Iron Gustav*—one of the last novels to come out of Germany—were deservedly well received. The upper level of fiction was, perhaps, higher than that of 1939 and admirable novels of the second rank included *The House of Markku* by Unto Seppanen, *I Shall Not Want* by Norman Collins, *The Devil in Green* by Gina Kaus, *Fanny by Gaslight* by Michael Sadleir, *Basilissa* by John Masefield and *The Chosen* by Edith Simon.

Although the last quarter of the year was marked by the beginning of the great air-raids on London, there was no noticeable diminution in autumn and winter publishing. Criticism and belles lettres were particularly well represented; and distinctive publications in this field ranged from *English Wits*, a collection of light, analytical essays by Desmond MacCarthy, Robert Lynd and others upon Sheridan, Hook, Wilde and their famous rivals; to Logan Pearsall Smith's carefully polished *Milton and his Modern Critics*, and M. C. Broadbrook's and M. G. Lloyd's learned little study of the poet Marvell. Prof. George Gordon Coulton, temporarily deserting his economic studies, published an unusual and suggestive history of mediaeval Latin, *Europe's Apprenticeship*; and in *Coleridge Fille*, a biography of Sarah Coleridge, Earl Leslie Griggs traces the influence of that remarkable and unquenchable man upon his immediate family. Poetry was little in evidence, but in his new translation of the *Georgics* of Virgil, Cecil Day Lewis displayed once more his metrical skill and felicity.

In other literary fields there was little noteworthy of mention, though *Pack Up My Bag*, Henry Green's autobiography, received a good deal of attention. In fiction, H. E. Bates's latest volume of short stories, *The Beauty of the Dead*, was widely praised; and Charles Morgan's new novel, *The Voyage*, was still more widely reviewed. (See also AMERICAN LITERATURE.) (J. Mr.)

Entomology. **Economic Entomology.**—The most important trends in economic entomology during the year 1940 have been along toxicological lines and especially in the development of new insecticides for the control of insect pests. These new discoveries have had far-reaching effects in the fields of agricultural, household, veterinary and medical entomology.

Insect-transmitted virus diseases of plants have been given much attention which has resulted in new ideas of the possible origin of life.

Insecticides.—Tartar emetic, $\text{SbOKC}_4\text{H}_4\text{O}_6$, has been found effective in the control of certain thrips, including the injurious citrus thrips, *Scirtothrips citri* (Moulton), of middle and southern California and the gladiolus thrips, *Taeniothrips gladioli* (Moult. & Steinw.), of widely separated areas in the United States and Canada. The material is applied as a spray and has little or no serious effects upon the plants treated.

The dinitro phenol and cresol compounds experimented with as ovicides for aphids have given seemingly good results and are being extensively used in various parts of North America in the destruction of eggs of *Hyalopterus arundinis* (Fab.), *Aphis pomi* (De Geer) and *Aphis rosea* (Baker) on dormant deciduous fruit and ornamental trees.

These chemicals are replacing to some extent the coal tar sprays because they are less toxic and injurious to the operators of spray equipment.

Methyl bromide fumigation has been greatly extended during the past few years and has reached vast proportions in connection with the fumigation of fruits and plant materials shipped in car-load lots. In the handling of plant materials originating in the areas infested by the Japanese beetle and the white-fringed weevil some 4,000 cars were treated during 1938-39. This material is also extensively used for fumigating granaries, mills and warehouses for insects infesting stored products and is also being tested for soil-infesting species.

Tree Injection with Chemicals.—The introduction of chemicals into trees for the destruction of barkbeetles and other wood-boring insects and fungi and for the prevention of infestation by these organisms has received considerable attention both in Europe and in North America.

Copper sulphate, arsenicals and other toxic chemicals are administered to living and recently felled trees. Young trees to be utilized in the natural condition with the bark intact are so treated. Considerable work has also been done by Fisher in England in preserving timber against insect attacks by the removal of the starch by steaming and curing.

Plant Virus Diseases Transmitted by Insects.—This world problem is receiving a great deal of attention from botanists, plant pathologists, entomologists, physiologists and physical chemists. Great strides have been made as a result of their studies, research and publication, as well as by those made in the medical and veterinary fields of virus affecting humans and other animals. Viruses were first discovered in 1892. During 1940 Stanley showed for the first time in North America an X-ray photograph of the discrete particles of the tobacco virus, a single

RAILROAD SPRAYER operating for white-fringed beetle control

particle of which measures 15 millimicrons in cross-section and about 330 millimicrons in length. According to Stanley (1940) a purified plant virus is subject to chemical analysis the composition of which includes 50% carbon, 7.5% hydrogen, 16% nitrogen, 0.2 to 2.2% sulphur and 0.5 to 4.1% phosphorus.

By means of very careful and exacting technique plant viruses have been examined most critically, and a number of distinct strains are recognized for many. For instance, there are now four distinct strawberry viruses indicated as *Fragaria virus* 1 to 4. While plant viruses are transmitted by many insects, the most important vectors are aphids and leafhoppers. The green peach aphid, *Myzus persicae* (Sulzer), appears to be involved more than any other single insect.

Insects as Food for Birds and Other Animals.—During the years there have been ever-increasing demands for insects as food for birds, fishes and other animals. These demands have created a market which has been largely supplied by foreign countries. It has not been possible to ascertain the volume or value of these commodities nor is it possible to procure data as to the extent to which these insects are commercialized. An importer, S. E. Abernethy, has furnished some information which may give an idea of the kinds used in the United States during the past year.

Mealworms.—*Tenebrio molitor* (Linn.) and other species constitute one of the most important foods for small domestic animals. They are sold in living condition. While they are raised extensively in relatively small lots in the United States, they have in the past been largely imported from Holland where they are reared in great quantities, but never sufficient to supply all of the market demands. Larvae of the broad-horned flour beetle *Gnathocerus cornutus* (Fab.), are also reared commercially to feed young birds in Europe.

Ant Eggs.—These are in reality the pupae of the common red wood ant, *Formica rufa* (Linn.), which builds large mounds or nests in the forested areas of Europe and North America. These nests are often very large and may contain as many as 100,000 individuals. By controlled robbing, the nests may be kept at a relatively high productivity.

The world supply is produced chiefly in Finland which controls the market. These dried ant pupae are generally used in feeding young birds and other animals.

Mexican Dried Flies or Water Boatmen (Corixidae).—Under these general terms are included fresh water insects, particularly the water boatman most often adulterated with fairy shrimp

METAL BARRIERS used to control crickets

(*Anostraca*?), and backswimmers (*Notonectidae*). From 25 to 50 tons are imported annually into the United States.

Biological Control.—The development of biological control methods for the subjugation of insect and plant pests has continued with considerable headway during the past 20 years and has reached a peak of great importance in the world of economic entomology. This method has recently been extensively employed in connection with many important insect and weed problems such as the gypsy and brown tail moths, the Japanese beetle, the sugar cane borer, the oriental peach moth, the woolly apple aphid, the European earwig, the European elm leafbeetle and the European spruce sawfly in North America; sugar cane and fruit insects in Hawaii; fruit flies, woolly apple aphid, St. John's wort and prickly pear in Australia; prickly pear and many orchard insects in South Africa; and like problems in other geographical areas. Special emphasis has been placed upon the use of *Trichogramma evanescens* (Westwood) as an egg parasite of many destructive moths and particularly the sugar cane borer and cereal-infesting insects.

Medical Entomology.—The recent establishment of the Juan Mina Entomological station of the Gorgas Memorial laboratory in the Panama Canal Zone extends the arm of research deeper into the problems of tropical medicine.

Yellow Fever Service in Brazil.—The Rockefeller Foundation, in charge of the yellow fever service in Brazil, relinquished this service to the Brazilian National Fever service, ministry of education and health, at the end of the year 1939. (See also MALARIA.)

Epidemics and Public Health Control.

Further progress in the knowledge of infantile paralysis was made when Armstrong reported the successful transmission of the Lansing strain of poliomyelitis through 12 generations in

white mice after adaptation to the eastern cotton rat. (See also INFANTILE PARALYSIS.)

Cox and Bell reported successful immunization of guinea pigs against Rocky mountain spotted fever with vaccines prepared from infected tissues of the developing chick embryo. Similar satisfactory results, using essentially the same method, were obtained with epidemic (European) typhus, and somewhat less conclusive results with endemic typhus.

Felton prepared an antigen from the polysaccharide of the pneumococcus germ and immunized 60,000 humans in the CCC and U.S. army. About 72,000 persons were used as controls. In the inoculated group, the incidence of pneumonia was reduced 50% as compared with the non-inoculated group, and the case fatality was lower in the inoculated group. Felton further studied this problem and found that of 1,099 individuals, 94% to 98% showed antibodies in the blood after inoculation, as compared with only 32% of this group that showed serum antibodies before inoculation. Of the individuals inoculated, 1% to 5% failed to develop antibodies. Felton believes that these people in the general population who would fail to react to inoculation to the antigen, or who would react poorly, may be the ones who develop pneumonia. Further studies on this important piece of work were under way in 1940.

Recommended protection for obtaining immunity against diphtheria was suggested by the American Public Health association after a sub-committee study. For children under school age, two doses of alum precipitated or three doses of plain toxoid at one month intervals were suggested.

A reinforcing dose should be given when the child is ready to enter school.

The massive dose treatment of early syphilis by intravenous drip method as reported by Hyman *et al.* was being intensively investigated. Hyman and his co-authors reported favourable results. The advantages of the massive dose treatment, should it prove safe, practical and effective, hold the possibility of greater convenience, greatly shortened period of infectivity, and a course of therapy to be measured in days rather than in months. It was too soon in 1940 to judge the ultimate effect of this method of treatment, although the group of cases followed for a period of five years appeared to be clinically and serologically cured. (For syphilis control see VENEREAL DISEASES.)

Estigarribia, José Felix (1888-1940), president of Paraguay, was born in Caragatay, Paraguay, Jan. 21. He entered the army at the age of 21 and after serving three years entered the École de Guerre in Paris in 1924; when he returned home four years later he was made chief of staff. He served in the war with Bolivia over the Chaco boundary and was promoted to commander-in-chief of the army.

Within a year of the truce of 1935 he was exiled following a revolution. Recalled in 1937, he was appointed minister to the United States. He was elected president April 30, 1939, and was inaugurated Aug. 15. In July 1940, he signed a new constitution

CLIPPERS of the Pan American Airways arriving at Miami from South America are fumigated with potassium cyanide gas to prevent transmission of the yellow-fever mosquito into the United States

centralizing administrative control.

He was killed Sept. 7, when the plane in which he was flying with his wife from the capital to his country residence crashed to the ground.

Estonia, country of north-central Europe, N. of Latvia; area, 18,371 sq.mi.; population (est. Jan. 1, 1939) 1,133,940. Chief towns: Tallinn (capital, 145,000); Tartu (60,800); Narva (24,000); Nomme (21,900); Pärnu (21,800). Language, Estonian; religion, Christian (Lutheran 78%, Greek Orthodox 19%).

History.—Ever since its declaration of independence, Feb. 24, 1918, Estonia has been shadowed by the fear that some day the Russian bear would again embrace it. The first approaches had been made when on Sept. 29, 1939, the little country was impelled to sign with the U.S.S.R. a new "treaty of mutual assistance and trade."

By the terms of this agreement Russia obtained the right to lease naval and air bases on the islands of Dagö and Ösel, and the town of Paldiski. This treaty, the repatriation of 12,000 German Balts from Estonia to the reich and the war between Russia and Finland were sufficient evidence to the Estonians that they could no longer hope to live their own lives.

On the 14th and 15th of July, 1940, Estonia, like its sister states to the south, held an election to determine whether it would apply for admission to the soviet union. It was virtually a referendum, and the conclusion taken for granted. In order to roll up a really impressive vote the "workers' bloc," supervised by the Russian commissar, A. A. Zhdanov, put forth a program of social reform and proclaimed "All power to the people and to the people only. Fight for the peace and happiness of Estonia and of the soviet union."

In due course Estonia was accepted as a republic of the U.S.S.R., and early in September the soviet government ordered U.S. consular and diplomatic officials out of the country. The United States had already frozen Estonian assets in the U.S.A., and Great Britain had retained the Estonian shipping found in her harbours.

Banking and Finance.—Revenue (est. 1939-40), 105,878,187 kroons; expenditure (est. 1939-40), 105,816,637 kroons; public debt (March 31, 1939), 127,292,630 kroons; notes in circulation (Aug. 31, 1939), 57,000,000 kroons; gold reserve (Aug. 31, 1939), 40,900,000 kroons; exchange rate (1939), 18.11-18.35 kroons (Ekr.)=£1 sterling.

Trade and Communication.—Imports (1939), 101,351,000 kroons; exports, 118,217,000 kroons. Principal imports were manufactured goods, iron and steel, raw cotton, fertilizers, sugar; principal exports were butter, cellulose, timber, flax, meats, eggs, cotton goods.

Agriculture.—Production (1939; in metric tons): rye, 227,657; potatoes, 874,252; oats, 149,448; barley, 90,042; wheat, 85,257. In the year 1939 the country counted 705,000 cattle; 694,000 sheep; 442,000 pigs; 218,000 horses; 1,991,030 poultry.

Etching. During the year 1940 the art of etching, as all other forms of creative expression, felt the inevitable effects of the war. Although man's need for pictorial utterance, and the aesthetic satisfaction to be derived therefrom, will persist as long as he himself endures, the atmosphere most conducive to it suffers from existing conditions, which the artist is the first to feel. Undoubtedly the etchers of continental Europe continued to work throughout the year, but the curtailment of communication between countries rendered it well-nigh impossible for the

western world to know what they have done. Spain, exhausted by internal conflict, fearing to be drawn into the greater one with many of her artists fugitives in other lands, produced practically nothing in the field of black and white; Italy, absorbed with critical national problems, had neither time nor heart art; the Scandinavian countries, the home of flourishing graphic schools prior to 1940, were either living under the domination of a foreign power or else in dread of so doing, and little of importance was produced by the etchers within their borders.

The suppression of personal liberty and the tendency toward regimentation of thought as well as of life that are part of a regime in Germany were death to creative art, and the great living German etcher, Kaethe Kollwitz, was in 1940 an aged woman unable longer to give of her genius. Karl M. Schultheis, a conspicuous figure, was a refugee in the United States. Poland, Hungary and Czechoslovakia, where healthy schools of etching existed in the past, were no longer heard from. So, too, Belgium, Bulgaria and Holland, all of whom produced significant work in 1939, had little to show for 1940. Mukul Dey, the Indian etcher, published work in 1940.

France.—The tragedy of France was reflected among her artists, some of whom died while most of the remainder lived within the former boundaries of that country were largely inactive in their respective fields. Between Jan. 1, 1940 and the collapse in June, the etchers Adam, Berg, Bonnard, Boullaire, Carrière, Goërg, Grandgérard, Guastalla, Laurencin, Legrand, Lévy, Luce, Moreau, Myr, Possoz, Rouvière, Villon and Vuillard were practising their art.

Great Britain.—In the midst of war and the threat of invasion British etchers carried on with splendid courage. Not only did those of established reputations publish new work, as C. E. Rieu, Cowern, Dent, Drury, Dodd, Fisher, Freeth, Gross, Hardy, Heath, Janes, Patrick, Robins, Rushbury, Smart, Spencer and Taylor, but such less familiar names as Archer, Brasham, Clilverd, Deakins, Orr, Phillip, Platt, Shaw and Spaul appeared in current print catalogues. The Royal Society of Painter-Etchers and Engravers held its usual annual exhibition. It is noteworthy that the British school of etching, distinguished for its conservative and traditional approach and highly developed technique, continued to be perhaps the most homogeneous in the world.

Latin America.—While comparatively little was being done in the field of etching in the South American countries—though Uruguay boasts a few native artists in this medium—Mexico was conspicuous for its graphic art. The woodcut and the lithograph appear to be the most popular forms, with some emphasis on aquatint, but Guzman, Maldonado, Ocampo, Vazquez and Velazquez Cueto produced etchings that appeared in various exhibitions both at home and abroad.

United States.—Greatest activity was in the United States and it is interesting to observe how many new names appeared during 1940 in the numberless exhibitions throughout the country. While Allen, C. W. and N. Y. Anderson, Auerbach-Levy, Bacon, Bendanier, Besedick, I. and R. E. Bishop, Bobleter, Borne, Botkin, Brooks, Browne, Butler, Chamberlain, Cook, Costigan, Daniel, Eames, Eby, Fabri, Frame, Gallagher, Ganso, Grant, A. H. Heil, Heintzelman, Higgins, Hobbs, I. D. Hoffman, Hutt, Kappel, Kloss, Kupferman, Landeck, M. Lewis, Loggie, Lucioni, Meyerowitz, H. Miller, Modrakowska, McNulty, Nisbet, Ostrowsky, Petersen, Raskin, Renouard, Rosenberg, Roth, Ryde, Schaldach, Sloan, Soderberg, Sterner, Swann, Tittle, Tuttle, Vargish, Washburn, S. M. Weber, Williams, Winkler, Woiceske, G. H. Wright and M. Young all continued their work, the previously well known L. Boyer, Brown, Budd, Com, Cooper, Friedlander, Green, Hagedorn, Hee, Helfensteller, G. A. Hoffman, Howard, Jackley, Johnson, Leedy, N. Levy, Malone, Meyer, Nakamiz

Palenske, Peirce, Rocker, Rogers, Sarkadi, M. C. Schutz, Sharp, Sherman, Shopen, Stone, Weidener, Wheeler, Wilbur and Willson published and exhibited.

A group of 26 print makers, among them a number of etchers, exhibited 42 prints at their annual exhibition at the Honolulu Academy of Arts.

The numerous print societies all over the United States, principal among which are the Society of American Etchers, the Chicago Society of Etchers and the Print Makers' Society of California, held their annual and travelling exhibitions during 1940. In addition, important exhibitions of prints were conducted by the National Academy of Design, under the auspices of the American National Committee of Engraving and under government administration.

In Canada the Society of Canadian Painter-Etchers and Engravers continued active. (J. T. AR.)

Ethical Culture Movement. A new type of religious fellowship, founded in New York in 1876 by Felix Adler, and in London in 1886 by Stanton Coit. Instead of agreement on a common theological creed, the basis is "dedication to the ever-increasing knowledge, love and practice of the Right." Extension of ethical knowledge is considered equally important with improvement of practice in personal, social, political, national and international relations. The American movement is represented by active societies in New York, Chicago, St. Louis, Philadelphia, Brooklyn and by groups in West Chester and elsewhere. These are united in the American Ethical union (secretary, George E. O'Dell; headquarters, 2 West 64th st., New York), which holds annual conferences and publishes a monthly magazine (*The Standard*) and other literature. The Ethical Culture movement pioneered in establishing social settlements, district nursing and legal aid to the poor, housing reform and improved methods of education. In 1939-40 much work was done in aiding refugees from Europe. The New York Ethical Culture society organized the Good Neighbor committee (interdenominational) for this and other co-operative purposes. Summer "work-camps," in which young people of different national and cultural origins are assembled, are being held as experiments in democratic living, to supplement winter studies for the understanding and defence of American institutions. The English Ethical societies are organized in an Ethical union (chairman, Lord Snell, 12 Palmer st., London, S.W.1.).

Spiller, *The Ethical Movement in Great Britain* (London, 1934); *Ethical Religion: Its Basis and Possibilities* (ed. A. Black, 1940). An extensive literature has been produced by Felix Adler, W. M. Salter, Stanton Coit, Walter Sheldon, A. W. Martin, H. J. Bridges, Percival Chubb and others. (Ho. J. B.)

Ethiopia: see ITALIAN COLONIAL EMPIRE.

European War. The stagnation which had descended on the so-called western front in the early autumn of 1939 after the German conquest of Poland, continued through the opening months of 1940. Great armies remained immobilized behind the Maginot line in France and the Siegfried line in Germany. Action between these lines was confined to reconnaissance patrols, sometimes in some force; to sporadic artillery duels and to air raids. The tension and intermittent alarms of a possible invasion of the Low Countries by the nazis continued like the ebb and flow of a chronic fever, after the first crisis in Nov. 1939.

The sea and air wars continued their undramatic course. Occasional air raids across the North sea directed at military and naval objectives by both sides were the principal warlike activities, while the unremitting, but largely unheralded pressure of the

Allied blockade of Germany and the German submarine and mine counterblockade of England grappled its tenacious way through the winter storms and fogs.

Conclusion of the Russo-Finnish War (*Jan. 1-March 13, 1940*).—The situation in Finland at the end of 1939 continued substantially unchanged through the first month of 1940. The swift moving Finns inflicted further losses on the Russians on various fronts, but the intense cold of one of the hardest winters Europe had known in years was equally effective in checking operations. Russian bombing attacks continued intermittently, and a vast wave of sympathy for the gallant Finns swept all over the western world (except in Germany). Beyond some 10,000 volunteers and considerable supplies and equipment from Sweden, very little of this sympathy was translated into practical help for the Finns on the fighting front.

Whether it was due to a reported transfer of the Russian command to the hands of General Gregory M. Stern of the far eastern soviet army, or to other causes, a change in Russian tactics began to appear toward the end of Jan. 1940. The first change was evidenced by the appearance of far better equipped Russian troops, men of much better fighting spirit, discipline and efficiency. This was followed by evidence that the scheme of simultaneous attack at many points on a wide front was being abandoned in favour of a tremendously concentrated, unrelenting attack, regardless of cost, on the Karelian isthmus (Mannerheim line) front. Russian aerial tactics improved. The bombing attacks were more concentrated and were systematically directed, as had been those of the Germans in Poland, on ports, rail centres, etc., of direct importance to the supply and communications of the Finnish front line forces.

Virtually the full weight of Russian attack early in February was poured on various sections of the Mannerheim line. Enormous concentrations of artillery fire and heavy aerial bombing were followed by wave after wave of mechanized and assault troops. Attack after attack was beaten back by the valiant Finns, but new Russian forces kept coming on over the bodies of their fallen. At last the Russians were using their numerical superiority intelligently, albeit ruthlessly. Toward the end, the attack was continuous night and day. Deprived of rest by lack of adequate replacements and by disruption of their communication lines, the Finns were finally worn down and beaten back.

As key positions were taken, fresh Russian troops fanned out to spread the attack, forcing the Finns back past the narrowest point on the Karelian isthmus. From then on, as the Finnish front lengthened, their effectiveness dwindled. Finally they were fighting in Viipuri itself, the cornerstone of the Mannerheim zone and a vital communications centre. For a flickering moment there was hope that the Anglo-French Allies would come to the Finns' aid, but Germany made it known that she would treat passage of Allied troops across Norway and Sweden as a hostile act by those nations and act accordingly. For the Finns themselves such a development would probably have added Germany to her Russian foes long before any Allied troops could have reached her. Through the intermediary action of Germany an approach was made to the soviet government and on March 13, 1940, Finland gave up her gallant but hopeless fight.

The terms of peace gave Russia virtual military control of Finland, including cession of areas which Russian forces had not even occupied. Loss of the entire Karelian isthmus, including Viipuri (Viborg) deprived the Finns of their principal fortified zone. Cession of a strip north of Lake Ladoga precluded erection of a new defence line. In the north it was agreed that a railroad should be built, connecting the Russian Leningrad-Murmansk line with the Gulf of Bothnia. This line across Finland was the very line of defeated penetration which had cost the Russians so

dearly. The naval base at Hango was leased to Russia and rights of passage across the Petsamo district were also conceded.

The relationship of this Finnish adventure to the main struggle was shrouded in mystery. It was, however, evident that Russian political intelligence had erred grossly in leading the soviet government to expect little or no resistance. It was surmised that German intelligence was better informed, but there were rumours that Germany had encouraged the adventure. Russia had gained greatly, with small effort, from the Polish campaign and quite evidently had been a disappointment to Germany as a source of supplies. It may well have seemed to the German fuehrer that a costly minor adventure might make his quasi-ally in Moscow more co-operative. Neither Russia nor Germany ever admitted that the latter had rendered any military assistance to the former during the Finnish campaign. But with the coming of spring, the main war once more became the chief preoccupation of the German high command.

By February, continuance of the Finnish war was increasing popular pressure in Britain and France to send armed aid to the Finns and that support would have to cross Scandinavia, using the railroad from Narvik through the Swedish iron ore districts which were supplying most of Germany's high-grade iron ore. The risk that the Allied troops in Scandinavia would seize the opportunity to take over the iron mines and also to establish a base for attack on Germany's coast was obvious. This mixture of fact and surmise logically culminated in two conclusions: (1) Germany facilitated the peace arrangements between Finland and Russia; and (2) Germany made acceptance of Russian terms inevitable by effectively preventing Norway and Sweden from agreeing to passage of Allied troops to aid the Finns. Thus, the Finnish peace cleared the decks for the next phase of the main war.

The Final Decision for "Total War."—In retrospect, the winter of 1939-40 recalls the centre of one of those tropical hurricanes which is dead calm, and which, as it passes over any area, gives there an illusion of the end of the storm. Actually, this fictitious calm presages the coming of the equally violent area of the hurricane on the other side of the calm centre. Except for the war at sea, the conflict between Germany and the Allies had withered away to such obscurity and quietness that there were days when certain New York papers had no war news on their front pages. Even the war at sea and the submarine losses became relatively negligible. At this moment a powerful peace effort took shape.

Its actual origin is still one of the undisclosed diplomatic stories of the war and has only indirect connection with the war itself, but certain known facts are significant in throwing light on aspects of national morale and calculations as to policy which influenced the most momentous decision regarding the conduct of the war since that made by Hitler in Aug. 1939 to risk a European conflict. When the war began, a basic belief in the western

world, particularly in Britain and in neutral U.S., was that tin was on the side of the Allies; and that the power of defence was so great, as represented by the Maginot line and the defence of Belgium, if that neutral should be invaded, that the Germans could not win a quick decision in the field. In short, the idea was that Germany would certainly lose and be destroyed by long war and probably could not win the desperate gamble of an attack in the west.

The winter of inaction shook this belief. First, the Russian benevolent neutrality and Italian nonbelligerency raised doubt as to the efficacy of the power of blockade. Second, it became apparent that Germany's internal strength, both as to morale and material supplies had been underestimated. Third, the actual test of inactive war began to put unexpectedly greater strain on the economy and morale of the Allies than on those of Germany. Germans had been for several years on a semiwar basis. As long as no major operations were in progress, the inactive winter of 1939-40 wrought slight change in German life and economic activity. The reverse was true of the Allies.

Early in 1940 prominent U.S. industrialists, having important interests and markets on the continent of Europe and in Britain nearly ruined by the state of war, returned to the United States and expressed the view that a reasonable, factual peace basis for negotiation would find a favourable reception in Berlin. Certain of these men had interviews with the U.S. president, Franklin D. Roosevelt. Shortly after, the president announced that he was sending Sumner Welles, U.S. undersecretary of state to Europe to visit Rome, Berlin, Paris and London to obtain a firsthand view of conditions and opinions in all those capitals and report to him. From Feb. 26 to March 28 Mr. Welles travelled on this mission, in a blaze of publicity, but in absolute obscurity as to what he said, did or reported. There is, however, little doubt that he reported to the president that he found no hope of peace by negotiation.

The British people in particular had become convinced that the destruction of Hitler and the Nazi regime was a great moral issue and all history shows that when this conviction really takes hold of the British people, they become almost unbelievably tenacious. In short, in spite of the boredom, the determination of the Allied peoples had hardened considerably since the war began. Some observers believed that a rare phenomenon in democratic nations was evident, the observed fact that, at great crises in national lives, the inarticulate mass of the people show a keener instinctive appraisal of the existence of irreconcilable fundamentals than do the better-informed minorities who usually mould public opinion.

The failure to find a receptive basis for the peace feeling which had originated in Berlin, where a negotiated peace on the existing conditions could only represent a victory, led to momentous results. The more radical Nazi leaders had been favouring their traditional "dynamism," an "all out" vigorous offensive to win by one tremendous, swift blow, trampling neutral rights and all other obstacles. The more cautious leaders, including probably many of the army higher command, were well content with the way things were going. These less reckless German leaders urged more patience, organizing Russia's great resources and thereby perhaps vitiating the Allied blockade. They certainly regarded the peace attempts with favour, as even the possibility of peace discussions strengthened their side of the argument.

The German Fuehrer alone could decide. Early in March the British took strong measures to stop the new movement of coal by sea to Italy. Rumours grew that the Allies would disregard Norwegian neutrality, to stop the German ships carrying ore from Narvik to Germany. On Feb. 16, the crew of a British ship boarded the German ship "Altmark" in Norwegian waters and

Official Estimates of Casualties in European War to Dec. 1, 1940

Nation	Armed Forces				Civilians	
	Killed	Wounded	Prisoners	Missing	Killed	Wounded
Great Britain	11,736	19,464	44,494	9,148	24,922	34,897
Germany	38,963	142,960		24,163		
Italy	4,531	14,293		Included in wounded		
Greece	Withheld as military secret				604	1,070
Russia	48,745	158,853				
Finland	15,000	40,000			640	

Unofficial estimates: France, 100,000 soldiers killed, 2,000,000 prisoners; Poland, 1,000,000 prisoners or missing. There are no reliable unofficial estimates for Belgium and The Netherlands.

leased several hundred British merchant seamen held on her as prisoners. In France, Daladier was replaced in March by the more vigorous Paul Reynaud as premier. For months the Germans had been rehearsing the invasion of Norway. On April 7-8 the British began laying mines in Norwegian territorial waters to intercept German ore ships. On April 9 Hitler's momentous decision was carried out, for on that day Germany overran Denmark and invaded Norway.

The Norwegian Campaign (*April 9-June 10, 1940*).—In the early dawn of Tuesday, April 9, German columns moved across the Danish border and German warships appeared in Copenhagen's harbour. There was little resistance and before noon the whole of Denmark was occupied, with the Danish king and government accepting the inevitable. Simultaneously, German warships appeared in the fjord leading to Oslo and German planes flew over the Norwegian capital. Norwegian shore batteries resisted the attack, sinking the German cruiser "Karlsruhe" and damaging the 10,000-ton "Bluecher," which later was sunk by a mine. The royal family fled from Oslo, with the government, leaving the capital to be occupied by the Germans during the day. Almost simultaneously German forces appeared in and took over Bergen, Trondhjem, Stavanger and Narvik. Apparently by accident, German naval forces fell in with light British forces laying mines on the Norwegian coast. In Narvik fjord a fierce action was fought by a British destroyer flotilla seeking to dislodge the German destroyers already in possession of the fjord. The British lost two destroyers, but claimed to have sunk one German destroyer and left three others helpless, to have destroyed six German merchantmen and an ammunition supply ship. The remaining days of the week saw aeroplane raids by the British on German naval units and landing points, attacks on German transports, with several reportedly lost and rumours of heavy naval actions in the Skagerrak. The dominant note was one of surprise and confusion. During this period, characterized by heavy snowstorms and bad weather over much of the battle area, it is now clear that even London and Berlin were not too accurately informed regarding the movements of their fighting forces. Berlin had the advantage, for the Germans were working on a most carefully planned schedule, with an immense amount of prior preparation on the ground by espionage, sabotage and treachery, notwithstanding their transparent and generally disbelieved claim that they had only acted to forestall British action against Norway's neutrality.

As the first week ended, it became clear that every division concentration area in Norway, except one in the far north, north of Narvik, had been taken over by the Germans within the first two days. The small, ill-equipped Norwegian army never had a real chance to mobilize. Confusion of orders appeared everywhere. Norwegian officers surrendered without fighting; others, of unquestioned loyalty, received orders to cease resistance. Communication facilities fell into German hands. The German forces had effected almost unopposed landings at all major ports and secured possession of all important airfields. Some troops were landed from merchant ships which had been lying in Norwegian ports for days. The German forces in the first week probably totalled about 25,000 men, although they later exceeded 100,000. It is doubtful if the Norwegians ever mobilized more than 30,000 men, two-thirds of whom were in the far north, whereas the strategically vital area of the country was in the south, with neither rail nor road communication between the two areas.

The Anglo-French Allies were able to land expeditionary forces on the Norwegian coast, mainly at Andalsnes and Namsos, small ports south and north of Trondhjem in central Norway, and at and around Narvik in the far north. These forces did not land until the Germans had been established in Norway for a week. From statements later made by Winston Churchill, then first lord

of the admiralty, it appeared that these forces amounted to only some 12,000 men, about one-tenth the number of Germans they ultimately had to evict. They never succeeded in getting mechanized equipment and heavy artillery ashore; their anti-aircraft defence and land-based air force were nearly nonexistent.

After the first few days, British sea power proved unable to check the movement of men and supplies from Germany, while German air power was proving able to interfere drastically with the landing of Allied reinforcements in the Trondhjem area. After several attempts to penetrate Norway and link up Norwegian resistance, the Allied effort had to be abandoned and the troops withdrawn, except from Narvik. Following this withdrawal, May 5-8, the Germans remained in possession of all southern and central Norway. The force at Narvik eventually took that town early in June, only to be withdrawn two or three days later. This final withdrawal after victory was forced by the desperate need of men and of restricting operations arising from the Allied disasters in France, which put France out of the war a week after the final evacuation from Narvik.

Allied casualties in land fighting were not heavy, largely because the forces landed were small. Germany reported her death casualties in Norway as 1,300. It is not clear whether or not this included losses on transports sunk in the early operations. The British lost several destroyers and the aircraft carrier "Glorious." In the popular mind, the great issue of the Norwegian campaign was control of the iron ore coming through Narvik from the Swedish mines. While this was then the source of Germany's high-grade ore, shutting off the movement from Narvik would not have prevented the ore moving through the Baltic a few weeks later when the ice broke up. Yet the British official statements and troop dispositions indicated that the Allied strategy regarded Narvik as the important strategic area, leaving south and central Norway relatively unplanned for. The German concept was clearly quite different. Having captured the southern half of the country, they had secured themselves against the risk of an Allied base in Scandinavia from which to attack north Germany. They had obtained air bases nearer northern Britain. As the event turned out, they eventually took over all Norway, including what was left of Narvik and sole access to the ore mines, upon which the Allies also had previously been drawing.

Politically, the effects of the Norwegian campaign were immediately more important than in a military sense. The disaster brought suddenly to a head all the accumulating discontent in Britain with the ineptitude of the Chamberlain government, whose war actions had been characterized by the prime minister of the World War of 1914-18, David Lloyd George, "always too late or too little."

One of the most bitter debates in the history of the house of commons followed the first evacuations from Norway, although the members did not know that the evacuation was being carried out from Namsos as the debate opened. The government received a vote of 281 to the opposition's 200, compared with a normal majority of 414 out of a total membership of 615. The prime minister admitted that British intelligence services had given ample warning of the Norwegian invasion. His explanations did not satisfy the house or the country, for his nominal victory fell short of a majority. On Friday, May 10, Neville Chamberlain announced that he had resigned as prime minister and that the king had appointed Winston Churchill, first lord of the admiralty, to succeed him.

In Germany, Reichsfuehrer Hitler's last doubts were settled by his Norwegian success. All counsels of moderation were swept aside, for he had seen how pitifully unprepared the Allies were to meet his great war machine. While Neville Chamberlain was making his last desperate effort to save his government, Germany

struck again. In the early dawn of May 10 the German divisions and air forces poured over the Low Countries, the Netherlands and Belgium; and when Winston Churchill became prime minister that evening, the "total war," of which, unheeded, he had been warning his countrymen for so many years, had begun. Thus in the wake of one disaster and in the lurid advance glow of a greater one still to come, this man of aggressive energy, who had long enjoyed the intense hatred of the Nazi leaders, took over the supreme responsibility for saving England from a greater peril than perhaps even he had ever visualized.

Destruction of the Low Countries.—*Invasion of the Netherlands and of Belgium; Battle of the Meuse (May 10-20, 1940).* Unlike Norway, both the Low Countries had been expecting, or at least fearing, invasion for months. Both were almost fully mobilized. The Netherlands and Belgium, after their abortive peace effort in November 1939, had consummated some arrangements looking to joint defence. Between them they had some 900,000 men, many of them indifferently armed and equipped. Their joint air force probably did not exceed 900 planes and was probably well short of that figure in modern combat machines. Great Britain had available the British expeditionary force, just south of the Belgian border with France, well equipped and trained. Together with the French armies immediately south of the Belgian frontier between Sedan and the sea, these troops aggregated perhaps 750,000 potential reinforcements for the Dutch and Belgian forces, in addition to a considerable but not definitely known air support. The entire available air force was, however, far short of what the Germans used.

At the time she invaded the Low Countries, Germany had a total of more than 200 divisions, say 3,500,000 men; between 4,500 and 6,000 planes, plus reserves, and this force included probably 12 *Panzerdivisionen* (armoured divisions), while the Allies had probably no more than 6 such divisions, not so well equipped. Germany probably allocated not less than 1,000,000 men, possibly 1,500,000 men (100 divisions) and approximately 3,000 planes for the invasion of the Low Countries.

The Netherlands relied for defence mainly on positions disposed on the lines of her "water defences" and on those defences which were essentially based on flooding certain areas in the path of the invading armies. Belgium had much more formidable defence lines. The Belgian line was reinforced by paralleling the Meuse river as far as Liège, and from there the Albert canal, a waterway with steep banks, making a formidable military obstacle. As a joint Netherlands-Belgium defence line, this system had one glaring weakness—it did not link up the Albert canal or Belgian Meuse lines with the Dutch lines, and this gap was one of the main contributing causes to the speedy isolation of the Netherlands.

While the two invasions began simultaneously, that of the Netherlands was pushed to a victorious conclusion first. Two factors paralyzed much of the Netherlands scheme of defence—parachute troops, used with real effect and in large numbers for the first time, and secret agents and traitors, the so-called "fifth column" men. In Norway both had been tried out, the fifth column particularly with marked success, but the Netherlands showed them both in close co-ordination on a large scale.

The broad strategy of the German attack followed the well established lines of the so-called Schlieffen plan, designed by Alfred von Schlieffen, chief of the German general staff from 1891 to 1907. His plan called for a great German army, with its left flank holding the French along the fortified Rhine and Moselle frontiers, swinging an extremely powerful right flank through the Low Countries into northern France, over the flat coastal plain which borders Europe on the Baltic, along the shores of the North sea and the English channel.

This plain provides the easiest road of invasion into the heart of France. The Schlieffen plan was carried out with weapons and forces which its author could scarcely have imagined. Some of these new weapons, particularly the plane used both for bombing and for landing troops behind the enemy defences, permitted modifications of the plan, which, however, merely accentuated its basic concept.

The outstanding modification of the old tactics was the use, as in Poland, of fast-moving, relatively small forces, penetrating deep into the enemy country with total disregard for the safety of their own lines of communication and supply. This served the dual purpose of disorganizing the immediate rear areas and of preventing co-ordination of various elements of the enemy forces. For example, it was instrumental in preventing the Allies from sending much needed reinforcement to the Dutch.

In the Netherlands, the ground attacks proceeded from several points, all converging toward The Hague, Amsterdam and Rotterdam. The most powerful of these struck across Dutch Limburg toward Maastricht. Its prompt success isolated a considerable part of the Netherlands from any hope of reinforcement from the south, for it was here that the gap existed between the Belgian defence lines, which at Liège and just west of Maastricht turned west along the line of the Albert canal and the Dutch water defence positions some 40 or 50 mi. further north. The only other practicable method for bringing in Allied or Belgian troops, other than by sea, to the Rotterdam area, was across the long bridge over the Maas at Moerdijk. This bridge was seized the first day by German parachute troops and held tenaciously until the German ground forces finally pushed through.

In Rotterdam, Amsterdam and The Hague, these troops landed from the air and picking up guidance at once from agents placed at their points of landing, did enormous damage to the Dutch resistance. Many of these agents were Germans who had entered the country years before as tradesmen, etc.; some were German naturalized as Netherlands and some were just plain traitors to their native land, men who had become imbued with the Nazi ideas. Intense air bombing was poured on all places offering the slightest resistance. Broken, overwhelmed, the Dutch did offer strong resistance and suffered heavily, but on May 14, realizing the hopelessness of their position, General Henri Gerard Winkelman, their commander-in-chief, surrendered the armies north and east of the Scheldt, virtually all the Netherlands. The queen and the government had previously made their escape to England, whence the Netherlands government continued.

Meanwhile, within two hours after the German invasion had begun on May 10, British and French troops left their preparation positions in northern France and hurried north across Belgium to meet the enemy. The French IX army moved north from the general vicinity of Sedan, which marked the end of the Maginot line proper. Apparently, the French were relying on the right flank of the IX army being covered by the Ardennes, supposed to be held by the Chasseurs Ardennais, regarded as one of the best divisions in the Belgian army. Just what did happen in the Ardennes is not clear, but a powerful German thrust came through at this point.

The German army which struck at Maastricht had crossed the Albert canal on the first day, under conditions which strongly suggested treachery. The Germans had similarly forced their way beyond the Liège forts and the force pouring out from the Ardennes now defeated the French IX army by falling on its exposed flank while it was moving up to position, and forced the passage of the Meuse. The battle of the Meuse was over, the Belgian Meuse-Albert canal line penetrated and turned, and the Germans were in France itself and through the Maginot line extension west of Sedan by May 13-14.

Battle of Flanders, or of the Channel Ports (May 21–June 3, 1940).—Following their now familiar tactics, German mechanized and motorized troops were hurried through the first gap and fanned out in the rear of the broken position at Sedan. Each further penetration behind the first one, each spreading of the forces moving in through the first break, once more demonstrated the age-old weakness of a fixed position, namely, that it either holds entirely or fails entirely. The odds are against a partial failure of a fortified line remaining only partial.

Actually, the Maginot line had not been "broken." The penetration had been made through the relatively weak extension of the Maginot line along the Belgian frontier. It had been made when, due to a strategic miscalculation, even that weaker section had been left badly undermanned. Nonetheless, the area which the Maginot line was meant to protect from invasion had been penetrated, and that operation alone made possible the succeeding moves which forced evacuation of the entire Maginot line itself.

On May 21, some of the German fast-moving units, having turned in a general westerly direction after penetrating the French defence lines at Sedan, crossed the Oise and entered the valley of the Somme, down which they raced to its mouth at Abbeville. By all previous standards of war, it was a mad enterprise, for they had carried a long narrow salient, very thinly held, if held at all, some 150 mi. west from their main forces, with the entire Belgian army, most of the British expeditionary force and at least two French armies, nearly 1,000,000 men in all, to their north, while the main French army lay behind and to the south of them.

Without pause, more troops were poured through the break. First came the heavy armoured divisions, closely followed by the lighter motorized troops and finally the heavy masses of infantry, the last named, far behind. Before and after and all around the far-advanced spearheads of mechanized and motorized troops swarmed their air force, principally dive bombers and parachute troops. Every possible rallying point, every traffic centre where Allied troops could be mobilized to strike counterblows was bombed, fired or occupied. Allied troops were mercilessly harried by this new flying artillery of the air.

Another new technique of this "total war" appeared. German air force units systematically terrorized the country well behind the fighting fronts. Streams of civilian refugees were bombed and machine gunned. Parachute troops fired small towns and villages and drove the population from their homes. This was not merely wanton cruelty or destructiveness, it soon developed. These huge hordes of panic-stricken refugees began to do what the Germans had not sufficient force to do directly—they clogged all the roads which were essential to movement of Allied military transport behind the fighting fronts.

The British expeditionary force first met the enemy in the vicinity of Louvain and Malines. After holding Louvain, being driven from it and retaking it, the British were compelled to fall back again as the German blows to the south across the Meuse and across the Sambre (held by the French), made the Dyle line (Louvain-Malines) untenable. Brussels and Antwerp fell in quick succession.

With the fall of Antwerp, the Belgian army was subject to the most severe pressure by a greatly superior enemy force. If, under that pressure, it was driven in and away from the coast, the entire Allied army in Belgium might be caught in a double envelopment, of which the southern wing coming up from Abbeville might meet the northern wing coming down from Antwerp and cut the Allies off from the sea and from the main French army.

The abandonment of Belgian cities west of Brussels, in any case, was being made almost unavoidable by German victories in southern Belgium and the spread of German troops across north-

ern France. In the menace of being cut off from the main French army was possibly the weak point of the German position; namely, that they might not yet have pushed sufficient troops through to hold that long narrow salient down the Somme valley. If that salient could be cut, not the Allied armies, but the daring German mechanized troops, the striking force of the German armies, might be cut off. A strong offensive was consequently launched from north of the Scarpe toward Cambrai and Bapaume. The French had massed seven divisions between Amiens and Péronne to strike north to meet the Allied force striking south, hoping between them to close the neck of the salient and trap the German *Panzer* troops.

These decisions were taken on the afternoon of May 23. Four days before, May 19, General Maxime Weygand was peremptorily called home from the near east and placed in command of all the Allied armies, replacing General Gamelin. The disciples of the power of the defence, of whom General Gamelin was outstanding, stood thoroughly discredited by the Allied disasters.

Weygand almost immediately removed 15 generals from important commands in the French army and replaced them with men more in sympathy with aggressive ideas. Among them was Colonel de Gaulle, who was raised to general rank, and who later refused to accept the French surrender.

In England, an Emergency Powers bill was rushed through parliament, conferring on the government virtually dictatorial powers over all persons and property. It was evident that the German advance to the English channel at Abbeville had not only imperilled the British army, it had also suddenly brought the invasion of Britain into the realm of the almost probable, as it had not been since Napoleon's day.

German air superiority was now turning the scale. Even before their ground forces occupied or beleaguered the channel ports, which had become the sole route for supplying approximately 750,000 Allied troops—the British expeditionary force, the remnants of three French armies, the I, VII and IX, the Belgian army and some remnants of the Dutch army—German planes had been heavily bombing those ports.

In addition to the tremendous problem of supplying so many troops, engaged in ceaseless combat of the utmost intensity, millions of civilian refugees had also been caught in the ever shrinking pocket, for the German pressure was now coming from the north, the east and the south.

The French army to the south was not in a position to assume the risks of striking a major blow north toward the entrapped Allied forces in Flanders. The same circumstance gave little basis for the temporary high hopes of the only other possibility of

RUINS OF ELVERUM, Norway, after its occupation by German troops April 20, 1940

SUPPOSEDLY IMPASSABLE road barriers in Belgium did little to retard German mechanized divisions in the week of May 10-17, 1940

breaking the trap—a general French counterattack down the valley of the Meuse from the vicinity of Montmédy-Rethel. Such a move, if successful, could have cut the lines of communication and supply of the entire German force in Belgium. The mere concentration of the forces necessary for such a stroke presented gigantic problems of transport and supply under most adverse conditions and involved taking grave risks by withdrawing troops from the Maginot line and the Italian frontier. The dynamic new Allied commander, General Weygand, almost accomplished the impossible, but at that moment, in the early morning of May 28, 1940, King Leopold of the Belgians surrendered his army.

This action gave rise to bitter controversy. The heads of both the British and the French governments indicated that the Belgian king's action was taken without notice to the British and French commanders. While this may have been true of his actual decision, it was certainly known to General Weygand, and to others, that Leopold was contemplating such action two days before he acted. It may be long before the full story of Leopold's surrender and its motivating causes is known, but the military consequences were immediate and clear.

The battle of Flanders, or of the Channel ports, was that morning irretrievably lost by the Allies. The Belgian army had been holding the northern arm of the rough crescent centring around Dunkirk and swinging over southwestern Belgium and northwestern France. The Belgian surrender imperilled the last avenue of evacuation. There was no time left now for a French major counterattack to be developed (within the day, the Germans began moving divisions toward Rethel whence any major French effort must come). No possibility remained of the Allied forces in Flanders rejoining the main French armies south of the Somme. Only evacuation by sea was left, and that was a desperate, an almost hopeless-appearing expedient.

No purely military study of the major aspects of the war could do justice to the skill and the heroism of the evacuation from Dunkirk. Suffice it to say only that, when it began, members of the British imperial general staff doubted that 25% of the B.E.F. could be saved. When it was completed, some 330,000 French and British troops, together with some Belgian and Dutch forces who refused to surrender, had reached haven in England.

Roughly, this represented three-quarters or more of the Allied effectives left in Flanders after the Belgian army had surrendered.

The evacuation was carried out under intense German air bombardment and while brilliant rear guard actions were holding off the ceaseless attacks of vastly superior numbers of German troops of all arms. One of the most motley fleets of history—ships, transports, merchantmen, fishing boats, pleasure craft—took refuge off from the very few ports left, from the open beaches themselves, for German air attacks had virtually destroyed most port facilities.

The royal air force, including planes from the metropolitan force in England, met and asserted at least temporary superiority over the tremendous German air forces, and the French navy, with daring and precision, assisted by courageous French naval craft, stood close in shore and not only covered the evacuation, but took off thousands of men in overloaded destroyers and other small craft. The men were saved in large measure, but most all their heavy equipment, tanks, artillery, motor transport and considerable stores had to be abandoned.

The Germans officially placed their own losses from May 10 to June 5 at 10,252 killed, 42,523 wounded and 9,463 missing. Prime Minister Churchill admitted losses of more than 30,000 killed and wounded and of nearly 1,000 guns. The Germans claimed 80,000 prisoners taken at Dunkirk alone. Some days later, General Charles de Gaulle, French general in London, estimated the Allied losses at about 65,000 killed and 950,000 missing prisoners. These figures obviously included the surrendered Netherlands and Belgian armies.

The French had lost, as battle units, at least three French armies and almost the entire British expeditionary force. They had lost completely the fortified line on the Franco-Belgian border and they now faced an enemy in great force on the soil of France, with its powerful right actually behind the main Maginot line positions, while the defence of Paris and of all southwestern France rested on an improvised defence line along the Somme and Aisne valleys.

The western section of the front, along the Somme, was perhaps the strongest section of the French front, due primarily to the ten reserve divisions. Yet it was against this sector that the German attack was launched.

Battle of France (June 5-25, 1940).—At 4:00 A.M., Wednesday, June 5, 1940 (nine minutes after sunrise) the German artillery opened fire, tanks and infantry moved forward and planes took the air in the last attack on France; the battle began which was at once named by Weygand, the Battle of France.

Utilizing every day gained by the heroic defence of the trapped armies in Flanders, General Weygand had established a new line of defence. Hinging on the Maginot line at Montmédy, the new French line ran roughly north of Stenay on the Meuse, thence southward to Attigny on the Aisne. From there the line followed the course of the Aisne past Reims and Neufchâteau to the vicinity of Vailly. Swinging northward to the Oise-Aisne canal, the line crossed the Oise, probably near Chauny and struck the Somme at or near Hom and ran down the Somme valley westward to the sea at Abbeville.

Results of the German attack over the Somme strongly indicated a failure on the part of the Allies to take advantage of the line, so dearly bought by the entrapped armies in Flanders, to prepare the ground for defence. It is fair to the French high command at this stage, however, to note that some of the troops did not arrive from other areas until the eve of the battle, while any that were available were used in the vain effort to close the Arras-Bapaume gap, or to wipe out bridgeheads the Germans had established on the south bank of the Somme. These excuses had little validity further east and the conclusion is inescapable that the French armies of 1940 fell far short of those of 1914-18 in tenacity and fighting spirit and leadership.

It was soon evident that the immediate German objective was not the taking of Paris, but a continuation of their effort to destroy the remaining French armies in the field. The defenders were now essentially a French rather than an Allied force. The German attack opened up along the front from Laon to the sea, with the usual barrage of dive bombers and powerful thrust of mechanized troops. For a short time, the French appeared to be holding on the Somme, but the powerful German mechanized thrusts, hurled back at many places, at last found weak points for their infiltration and the deadly routine of Poland and Flanders was repeated. By June 8, they had forced the passage of the Aisne and Roye on the Avre and Noyon on the Oise had been overrun. A general retirement now was carried out by the French, from the sea as far east as the Chemin-des-Dames.

In the air, the Germans were meeting an air force which, while inferior, was increasingly British in composition. The British royal air force was taking a big share in the battle, both over the German armies and far in their rear, bombing communications and concentration points.

On June 10, 1940 Italy entered the war on Germany's side but her active participation made little difference. Meantime, the German threat to Rouen had developed, the Seine had been crossed and the forces moving down from the Aisne and the Oise were coming closer to Paris. No military gain seemed likely by defending the city, the government having already gone to Tours, and on June 14, Paris was evacuated by the French army, now moving south to set up a new defence on the Loire. Between the date of Italy's declaration of war and the fall of Paris, the first indications of the disintegration of the French armies began to appear. It has since been stated in an editorial in the semi-official and usually well informed *Temps* that on June 12, General Weygand demanded that the government seek an armistice.

About that time the Germans claimed 100,000 French prisoners had been taken since June 5. It was at this time also that the German advance widened its front east of Laon, moving across the Aisne near Reims and taking Reims and Châlons-sur-Marne. The day after the nazis entered Paris, the fall of Verdun placed the German armies well in the rear of the main Maginot line. The troops garrisoning the line were likely to be trapped without possibility of serving a useful military purpose. Actually, evacuation of the Maginot line appears to have begun immediately following the fall of Verdun.

The French government had moved from Tours to Bordeaux,

since Tours was now on the new defence line on the Loire. Early in the last week but one of the fighting, Premier Reynaud issued a stirring appeal to all France and her allies and friends, proclaiming his intention to maintain the battle even if pushed back to French North Africa. On the day Paris fell, the day the government fled from Tours to Bordeaux, he issued another appeal, but the note of confidence was gone. He now said: "Today the life of France is at stake. . . . Our fight, each day more painful, has no further sense if in continuing we do not see even far away the hope of a common victory growing." On Sunday, June 16, the Bordeaux radio announced that Reynaud had resigned as premier and had been succeeded by Marshal Henri Philippe Pétain, the victor of Verdun in the World War of 1914-18, the author of the rallying call *Ils ne passeront pas*.

Although the cabinet included General Weygand as minister of defence, the presence of noted pro-fascists, appeasers and pacifists, such as Pierre Laval as minister of justice, and the disappearance of uncompromising bitter-enders, such as Reynaud and Georges Mandel, Reynaud's minister of the colonies, left little doubt that this government had been formed to bring the war to an end. On June 17, the 84-year-old Marshal Pétain, "with a broken heart," asked for honourable terms of armistice.

There were delays, for the Germans were now in no hurry, but on June 21, 1940 the German terms were presented in the presence of Adolf Hitler to the French delegates, in the same railway car at Compiègne where the armistice of Nov. 11, 1918, ending the World War, had been signed. The following day the French accepted the harsh terms of surrender (see *Franco-German and Franco-Italian Armistices*, for terms), but they were required to negotiate separate terms of armistice with the Italians before the German armistice became effective. This was done on June 24,

GERMAN PARACHUTE TROOPS descending on a Flanders field in May 1940

1940 in the Villa Incisa, about 12 mi. from Rome. The news was flashed to Berlin and six hours later, at 12:35 A.M. French time, June 25, 1940 hostilities between France on the one hand and Germany and Italy on the other, were ended.

During the last week, from Marshal Pétain's request for an armistice on June 17 to the end of fighting on June 25, fighting continued. The Germans penetrated the Rhone valley as far as Lyons, which was retaken by the French, only once again to be seized by the Germans, but evacuated under the armistice terms.

As was inevitable, the French surrender led to bitter recrimination and eventually virtual war with their British allies. Mr. Churchill, the British prime minister, bitterly denounced the surrender of the Pétain government. Insofar as that government had surrendered the French fleet into virtual German and Italian control, the reproach seems to have had some justification.

On the other hand, the French had made a gallant fight. Their later attempts to blame their defeat on inadequate British aid had slender foundation, except that they blamed their allies for being in the same sorry state of unpreparedness that they were themselves. If there was no British expeditionary force at the end, it was largely because it had been destroyed as the consequence of blundering by the French high command at the Battle of the Meuse and in permitting the break through at Sedan on May 13-14.

That the French fought valiantly remains to their eternal credit. German official casualty lists give eloquent testimony as to the quality of French resistance, however belated and inadequate were their preparations for defence. The German losses in the 20 days of the Battle of France, right up to June 25, were in killed and wounded, 60% larger than in the 26 days from the invasion of the Low Countries to the fall of Dunkirk. German losses were stated in German official summaries as 16,822 killed, 68,511 wounded and 8,921 missing. Exact French losses are not yet known, except for the German claim of 1,900,000, which includes the total French armies surrendered as prisoners.

Franco-German and Franco-Italian Armistices. (June 22 and 24, 1940).—The terms of these two armistice agreements, being in effect complementary parts of one armistice, were very similar in all but territorial provisions. The German consisted of 24 articles and an appendix and the Italian of 26 articles.

Article I provided for the cessation of all hostilities in all

parts of the French republic and colonial empire. Article provided for occupation of certain specified French territory German and Italian troops. German troops occupied roughly the area of France, including considerable sections from the south to the Spanish border, along the Bay of Biscay, sections which they had not entered when the armistice was signed. Germans occupied the entire west coast of France from the Spanish border to Belgium and all France north of a line running from the Swiss frontier near Geneva through Dole, Chalon-sur-Saône, Moulins, Vierzon, to 20 km. east of Tours and thence southerly to St. Jean-Pied-de-Port on the Spanish border.

In contrast, Italian troops occupied only the slight areas they had actually conquered, while the French agreed to demilitarize an area 50 km. wide west of the line of the Italian furthest advance, which was to say, 50 km. west of the Franco-Italian border for the most part. In addition, Toulon was to be demilitarized. On July 5 this provision was modified, following the success of British attacks on French naval units to prevent them passing under German and Italian control as provided in articles VIII (German) and IX and XII (Italian).

Article II (Italian) provided further for demilitarization of certain colonial areas in French North and East Africa. Articles II to VII, inclusive (German), and IV to XI (Italian) covered administrative provisions for demilitarization and demobilization procedure and for control of occupied territories.

Article VI (Italian) specifically called for demilitarization within 15 days of French "fortified areas and naval bases of Toulon, Bizerte, Ajaccio and Oran." No corresponding provision in the armistice with Germany was necessary, since Germany was in actual possession of all other French naval bases. Articles VIII (German) and XII (Italian) called for concentration and demobilization and disarmament at French ports of all French naval vessels. These provisions were the root of a bitter clash between the erstwhile Allied governments, which culminated in the British naval attack on the French ships at Oran on July 3. (See *The War at Sea*.) On July 5 Germany and Italy agreed to modification of the naval articles, so as to enable French resistance to the British. Although not so regarded at the time, in the light of subsequent events, this was the first tacit admission by the axis powers, particularly Italy, that, notwithstanding all their boasting, the Italian fleet alone could not control the Mediterranean against the British.

The remaining articles of both armistice agreements provided for a great number of detailed arrangements subjecting France effectively to enemy control of her trade, communications, merchant shipping and specifically forbidding any form of assistance to Britain for the remainder of the war. French prisoners of war were to remain prisoners, but German and Italian troops taken prisoner were to be released forthwith.

Article XVIII of the German armistice obligated the French government to bear all the costs of the German occupation. Other clauses obligated France to maintain in good order all property to be delivered to Germany and to furnish all labour necessary to restore damaged harbours, docks, rail and other facilities to be delivered to the Germans (article XIII). Article XIX, dealing with prisoners of war, contained a provision that "The French government is obliged to surrender upon demand all Germans named by the German government," obviously aimed at securing possession of the persons of refugee German exiles from the rigours and persecutions of the Nazi regime.

Results of the French Surrender. (a) *At Home.*—The obvious intent and immediate effect of these two agreements was to reduce France to utter subjection, primarily to Germany. Italy soon turned out to be too weak to enforce any claim that even French colonial governments chose to stand firmly against. How far this subjection to Germany went, was evident within two

weeks, when the French national assembly (about two-thirds of the members being present), under the guidance of Pierre Laval, authorized a new constitution for France, abolishing the republic and substituting a totalitarian regime; substituting the slogan, "For labour, family and country," for the old revolutionary watchwords of democratic France, "Liberté, égalité, fraternité." In the course of the next few weeks this same Laval emerged as the dominant figure of the chief of state's (Marshal Pétain's) cabinet, becoming vice-premier in succession to General Weygand. Eagerly courting the conquerors' every demand, he eventually overreached himself and was abruptly dismissed by the old marshal in Dec. 1940, thereby precipitating a crisis in relations between Marshal Pétain's government and Hitler's reich as the year ended.

(b) *In the French Colonial Empire.*—France's surrender precipitated various developments throughout her world-wide colonial empire. For a time there was considerable doubt as to whether the colonial governments would concur in the surrender. Eventually most of them did. This decision in Algeria and French North Africa precipitated the British naval action at Oran on July 3. In Syria, the administration gave such grudging accession to the terms of the armistice that an Italian mission lodged forceful complaint at the number of French and Polish troops who were being allowed to desert and cross the borders into British Palestine or Turkey. As 1940 came to an end, considerable uncertainty existed as to just how far actual demobilization of the French forces in North Africa and Syria had proceeded. There was a general impression that the strength of these forces remained much what it had been at the moment of the June armistice and that only those elements of the famous Foreign Legion actually in France had been affected by the terms of surrender. In French West Africa, after one abortive attempt at Dakar, there was considerable sympathy for the cause represented by General de Gaulle, who, scorning the armistice, had fled to England and set himself up as the leader of "free Frenchmen." Shortly after the Dakar setback, de Gaulle was welcomed in the Cameroons and won over French Equatorial Africa. Subsequently, General Weygand left the Pétain government at Vichy, France, and proceeded to Algeria and Tunis, with the announced mission of holding North Africa in line. It was understood that he was loyal to the marshal, but not bound to any successor, such as the ambitious Laval might have been. After the latter's fall, as 1940 closed, the resultant rumours of strained relations between Vichy and Berlin gave rise to speculation that Weygand, if Pétain was overthrown, might resume the war in North Africa.

(c) *In the Americas.*—While the armistices were being negotiated, the U.S. government had notified all interested European

ONLY SURVIVING MEMBER of a French tank crew surrendering to German troops during the battle of Flanders in 1940

THE CROWNING TRIUMPH of human ingenuity as envisaged by Herb Block of NEA Service

powers that no transfers of European colonies in the American hemisphere to non-American nations would be recognized by Washington under the Monroe Doctrine. On July 1, the German foreign minister made an ambiguous reply, denying Germany had any intention of acquiring French, Dutch or other European colonies in the western hemisphere, but making observations plainly indicating willingness to accept the United States interpretation of the Monroe Doctrine. The U.S. secretary of state reiterated his previous warning at a press conference on July 5. The question was left open of the status of those European colonies with nominal sovereignty unchanged, but with the home governments, as were the French, apparently accepting German domination. The Dutch colonies still owed allegiance to their queen in exile, and the Belgian Congo in Africa to its government in exile, so that the question of German domination of them did not yet arise. In the French West Indies, certain French warcraft and a number of aeroplanes purchased from the United States, took refuge. Coincidental with the British naval attack at Oran, British warships took up a patrol off the French West Indies, presumably to prevent the French craft proceeding to Europe under the armistice terms. After some weeks of tension, a *modus vivendi* was worked out and ships of the American neutrality patrol apparently took the place of the British vessels. America released some of the sequestered French credits in the United States to purchase needed foodstuffs and supplies for the French West Indies. Perhaps it was significant that this easing of tension coincided with rumours of cooling relations between Vichy and the German conquerors, but as 1940 ended, the significance, if any, was hidden in the future.

(d) *In the Far East.*—France's fall was promptly seized upon by Japan as an opportunity to serve demands that she stop all traffic from French Indo-China to the Chinese government of Chiang Kai-shek at Chungking and submit to Japanese inspection of her railroads. These demands were accepted without serious demur, to be followed by other encroachments. Some were re-

sisted, but to small avail, and the end of 1940 saw Japanese troops established on French Indo-China's soil, while Thailand (Siam) (suspectedly under Japanese instigation) was attempting invasions and creating incidents on the opposite frontier. Japan began a large-scale withdrawal from south China and many signalled to an intention to take over all Indo-China, preliminary to an attempt on Singapore. The entrance of Japan into active partnership in the Rome-Berlin axis on Sept. 27, 1940, strengthened these impressions. The Japanese move into the axis was answered the following week by Britain announcing reopening the Burma road to supplies for Chiang Kai-shek and by the United States warning its nationals in the far eastern territories under the shadow of Japanese aggression to come home. The counter-moves had a disconcerting effect on the Japanese, who evidently had not expected such strong reactions and the far eastern western Pacific situation between Japan, Great Britain and the United States remained *in statu quo* at the end of 1940, marked however, by almost unrelieved and officially admitted strained relations between Japan and the western nations.

(e) *In Europe.*—Within the week in which France surrendered soviet Russia promptly demanded and secured from Rumania the surrender of Bessarabia and of northern Bukovina, acting apparently under the dual motive of protecting her frontiers further from the growing power of Germany and taking advantage of the now obvious worthlessness of the former Anglo-French guarantee of Rumanian integrity. King Carol II of Rumania threw himself into the protecting arms of Adolf Hitler. Within a few weeks

GERMAN BLOCKADE OF GREAT BRITAIN 1940-41

and lost most of Transylvania to Hungary and of the Dobruja to Bulgaria and had been forced to abdicate in favour of his son, Michael. Carol fled into exile, accompanied by Magda Lupescu, leaving behind him a kingdom in anarchy and overrun with German troops. Spain naturally came under powerful axis pressure with German troops on her Pyrenees border, but after weeks of tense diplomatic struggle, still stood neutral as 1940 closed. The Spanish caudillo, Franco, was aided in resisting axis pressure both inside and outside Spain by the Italian defeats in Greece, Albania and North Africa by the Greeks and British; by the continued resistance of the British (although their collapse within two weeks had been a major premise of the June armistice negotiations), and by British open economic help in meeting Spain's problems hanging over from her own civil war and the effect of the blockades on her trade. It was suggested in some quarters at intimations that Spanish yielding to the axis might involve at least tacit U.S. economic displeasure may have strengthened the anti-axis group in the Spanish government.

(f) *Changes in the Blockade Dispositions.*—The terms of the armistices changed the basis of the blockade plan. German occupation of all western Europe to the Spanish border, with Spain sympathetic, made it necessary to extend the British blockade to the entire continent of Europe and the British fleet had alone to shoulder the whole task of blockade and convoy. It was now certain that no food shortage would become operative in Germany, unless the war was prolonged into the spring of 1941, and doubtful even then. The German situation was improved in other respects as well. Direct control of Luxembourg and Lorraine, access to Sweden and direct contact with Spain solved all problems of iron ore supplies, much as to copper, quicksilver and other minerals, placed by the German victories beyond reach of sea blockade. Oil remained little changed, except that all of Rumania's supplies were available to the reich and none to Britain, but these were never deemed sufficient for Germany alone, to say nothing of Italy. Russia's supplies remained both unknown in quantity and enigmatic in availability. All this did not make the British blockade futile. For one thing, there were still some essential supplies not adequately provided for. For another, many of those supplies which were available customarily moved by sea-borne carriage and the British blockade forced them to move by rail and inland canal over a traffic system not equipped to handle such volume. The R.A.F. devoted considerable energy, with success, to damaging this inland transport system.

ESCAPING from the Flanders trap in the last days of May 1940, thousands of British troops waded into the sea near Dunkirk to board all types of ships waiting to evacuate them to England

There had always been two blockades, the Allied blockade, now the British blockade of Germany and the German, now the axis blockade of Britain. German victories helped the latter.

With all the ports from the Spanish shore of the Bay of Biscay to the North cape in their hands, the German submarine operation problem was immensely simplified and that of the British equally complicated. No longer, as in the war of 1914-18, could the German submarines be shut out of the Strait of Dover and largely excluded from the English channel and the waters south of the British isles. Moreover, Irish ports, available to the British convoy guards in 1914, were not available in 1940 by reason of Irish neutrality. The problem was becoming acute between Eire and Great Britain as 1940 closed. New bases in France and the Low Countries aided the German air force very effectively in the blockade of Britain in the closing months of 1940.

British shipping losses mounted rapidly. German claims on this subject were apparently exaggerated when they put these losses from June 25 to the year's end at 3,900,000 tons of merchant shipping, about 625,000 tons monthly. Competent neutral authorities placed the total losses of British, Allied and neutral shipping for the entire 16 months since Sept. 1939 at approximately 4,200,000 tons and estimated that the average monthly loss in the later months of 1940 ran about 325,000 tons. It was admitted that some 200,000 tons were lost in one disastrous week, but at the end of December a single week's loss had also fallen to some 40,000 tons.

In the Pacific, Japan's increasing hostility culminated in reports of 14 commerce raiders fitted out under the German flag in Japanese ports. Shipping losses certainly mounted in the Pacific and Indian oceans. The shift of Japan from an ally in 1914-18 to a nearly open enemy added heavily to British naval problems and also held some promise of complications with the United States in 1941.

The War at Sea (April 9 to July 3).—Throughout this period the Allied (after June 25, the British) blockade of German territory continued. After Italy entered the war on June 10, this blockade was also applied in full rigour to Italy and Italian shipping and colonies, but with the handicap, after two weeks, of not being able to use French naval bases.

Prior to the French surrender, the principal naval actions arose out of the German invasions of Norway and of the Low Countries and France. In the sea fighting connected with the Norwegian campaign the British losses included 4 destroyers, 1 tanker, 1 aircraft carrier ("Glorious"), while the French lost 1 destroyer and the Norwegians lost 2 gunboats. German losses included 1

INTERIOR OF THE COMPIEGNE DINING CAR during the Franco-German armistice negotiations of June 21-22, 1940. German officers are to the left, French officers to the right

tanker, at least 1 transport, 2 cruisers, 6 destroyers, 6 merchant ships, 1 supply ship and heavy damage to the battleship "Scharnhorst," involving possibly her ultimate destruction while in dry dock undergoing repairs. Proportionately to their total strength, the German losses were the heaviest among the principal belligerents. In the early part of the operations the Allied fleets seemed to be in control, but ultimately the German air force proved able to prevent the Allied naval forces from cutting off the German troops in Norway from Germany. That superiority, however, did not extend very far off shore.

The next important act in the sea war accompanied the invasion of the Low Countries and France and is still shrouded in considerable uncertainty as to vessels engaged, losses and similar matters. Broadly, it was begun by the Germans with the movement of some relatively small forces down the Dutch coast. Allied landing parties, apparently predominantly British, did considerable destruction to Dutch and later to Belgian and French ports about to be, or actually, seized by the Germans, blocking channels by sinking vessels, destroying docking facilities and similar activities.

The outstanding naval exploit of this phase of the war was the evacuation of the Allied forces from Dunkirk. In co-operation with the air force, apparently again predominantly British, the Allied fleets covered this extraordinarily difficult evacuation. With their guns they helped maintain artillery protection for the retreating forces and assisted in holding off German occupation of the shore. They put up a tremendous anti-aircraft barrage to assist the air force. Both British and French ships were lost, principally destroyers and other light craft. Fortunately foggy weather on several days helped restrict the German air attacks. During the evacuation 220 light warships and 650 other vessels were used, the vast majority being British.

Battle of Oran (July 3).—By tragic irony, the greatest naval action of the war up to the end of 1940 was fought between the former French and British allies. Under the armistices with Germany and Italy, the French engaged to take their fleet into French ports and disarm their ships under German and Italian control. Great Britain regarded this move as adding the powerful French fleet to the Italo-German strength to make a force possibly equal to the British.

The British government had agreed with the Reynaud government, just before the surrender, to release France from her obligations as an ally in order to seek an armistice, provided the entire French fleet was placed under effective British control and not surrendered to the enemy. The British held that the Pétain

government's acceptance of these conditions of the armistices was an act of treachery, and they gave no weight at all (quite naturally) to the solemn assurances of Germany and Italy that they did not "intend" to use the French fleet, so placed under their control in the war, *i.e.*, against Britain.

Much doubt remained for some days as to whether the French naval officers and the French colonial governments would accept the armistice terms arranged by the Pétain government, but when it became evident that the governors in French North Africa and Syria at least would do so, the British acted swiftly. They took over all French naval vessels in British ports, made agreements with those in Alexandria, Egypt, to accept internment and militarization for the duration of the war and summoned Admiral Marcel-Bruno Gensoul at Oran, Algeria, to do the same, or to join them against the "common enemy," or to proceed to West Indian ports, there to remain interned.

The French admiral refused all these alternatives and in the late afternoon of July 3, a British squadron under Vice-Admiral Somerville opened fire on the French. Vice-Admiral Somerville later reported he had sunk the battleship "Bretagne" and had damaged and driven ashore the battleships "Provence" and "Dunkerque," the destroyer "Mogador" and the seaplane tender "Comandant Teste" (the French later stated this last ship was not at Oran). The battleship "Strasbourg" escaped with five light cruisers, but planes of the fleet air arm pursued and struck "Strasbourg." French and British accounts of the resultant damage differed materially, although it was agreed that she and the cruisers did reach Toulon.

As a result of these various British actions, out of several French capital ships, only "Strasbourg" remained afloat and under French control. Of four battleships building, two on the way may have been seized by the Germans, far from completed, and these may have been damaged. Of two nearly completed "Richelieu" was probably incapacitated by a daring attack at Dakar, while "Jean Bart" was virtually demilitarized in the harbour of Casablanca. Possibly two-thirds of French destroyers, submarines and cruisers remained under French control. It was notable that this most drastic British naval action had taken place in the Mediterranean without Italian interference.

One week after Oran, on July 10, the British apparently sought out the Italian fleet, for both Italian and British communications reported extensive naval and air-naval action in both ends of the Mediterranean, involving the strongest ships of the Italian navy. These actions were indecisive, without significant losses.

The War in the Air (April 9-June 18, 1940).—Much of the air activity during this period was closely related to the land and sea fighting and, in its broader aspects, has already been discussed.

ssed. What is stated here should therefore be read in conjunction with previous discussions of the operations in Norway, the Low Countries and France.

On April 10, apparently with the objective of hampering British naval action in support of an expeditionary force to Norway, the Germans made an important air raid on Scapa Flow, which lasted one hour and forty minutes. A few months later, such a raid would have been regarded as a rather minor affair, but at that stage of the war, a raid in which 60 German planes participated (the estimate given by the British) was regarded as, and was, one of the most important up to that time. The British reported bringing down six German raiders and stated that damage done was slight.

Immediately following their first landings, during the few days when Allied naval forces seemed able to interfere with their troop movements by sea, the Germans moved considerable numbers of troops to Norway by air. It was estimated that they could transport about 4,000 daily in this way, but it was questionable that much heavy equipment, tanks, armoured cars or even heavy guns could be sent in this way. These items were moved in by sea as soon as the German air power had reasserted control over the narrow sea passages.

From the outset, the Allies were handicapped by operating from air bases 200 to 400 mi. distant, or from naval plane carriers, while the Germans had advanced bases at Aalborg in Denmark. They soon established themselves also at Stavanger and Bergen and Oslo in Norway, which points were consistently and heavily bombed or shelled by Allied air force or naval vessels. Very stormy weather during much of the campaign hampered both air forces, but rapidly lengthening days in the far northern latitudes worked generally in favour of the Germans.

Superior air power was a decisive element in the German victory in Norway, where the Allied troops complained bitterly of their inadequate anti-aircraft resources, and in France and the Low Countries, where the Allies had better opportunity to utilize

their own numerically inferior air forces. With the approaching surrender of France, a new phase in the air war opened, beginning with relatively important sustained air attacks on Britain by Germany and on Germany by the British. These will be discussed under the heading of the *Siege of Britain*.

There was one incident in the air war, isolated from the others, filled with poignant interest, in that it grew out of the naval battle at Oran and the British-de Gaulle attack on Dakar in the last week of September. During the Dakar attack, some of the French government's planes, disarmed under the armistice, had been rearmed and had attacked Gibraltar. More damage was apparently done by this brief French effort than by all the Italian attacks, but none of them was decisive.

Siege of Britain (June 19 to Dec. 31, 1940).—Beginning about June 19, just after France had asked for an armistice, the British and Germans began systematically attacking each other over widely spread areas with forces of about 100 planes daily, or nightly. Both sides contended they were aiming at only "military objectives," but it was plain that the war had reached that long-expected stage where "military objectives" were being given a very elastic definition and certainly included railway centres, ports, plane and munition factories. Numerous civilians were killed.

The Germans and Italians were openly talking of the great attack that was to destroy Britain, in which air attack was obviously to play an important part. The British were grimly determined to maintain the war alone and to destroy everything in Germany or Italy or in territory held by the axis nations that could help the expected attack. Britain's air position, always vulnerable, had now become deadly. She was faced with a possible combination of German, Italian and French air forces, of which either of the first two alone were numerically superior to the British. Her enemies controlled a long line of air bases, from northern Norway right down the west coast of Europe to Spain. All these were in easy flying distance of vulnerable spots on the British isles, some only a few minutes distant. All her sea approaches could now be covered by enemy air patrol and attack. All over Britain the country was prepared for invasion by para-

THE SAME FAMOUS DINING CAR in which the Armistice of Nov. 11, 1918, was signed at Compiègne was again the scene of armistice negotiations between Germany and France on June 21-22, 1940, after the latter's military collapse. After the Germans moved the car to Berlin

chute troops, as well as by sea-borne forces. Many observers believed that if the Germans had invaded England immediately after the Dunkirk evacuation of the shattered B.E.F., they would have conquered Britain. Instead, they turned south against France.

The reason for that decision is a matter of speculation until the inner history of Germany's war command comes to be written. It is, however, now generally accepted that all the parties to the armistices, Germany, Italy and France, assumed that with France out of the war, the British would come to terms within two weeks. Certainly another powerful peace movement was launched behind the scenes.

Months later, after his retirement, Joseph Kennedy, then U.S. ambassador to Great Britain, was quoted as saying in private conversations that "the best people in England" wanted peace, but that Winston Churchill blocked it. It would perhaps be more accurate to say that the common people of England had at last been shocked into full realization of the fact that German victory meant virtual slavery and probably slow starvation for them and they turned resolutely against such a peace, obviously the only peace Hitler would have considered at the time. Winston Churchill embodied that belatedly awakened popular will in England, and it seems only fair to say that it included at least some of Mr. Kennedy's "best people."

Whatever the inner, hidden causes, there now began the unique spectacle of the literal siege of a great nation of nearly 50,000,000 people. Six months later, after appalling destruction, that siege showed no signs either of succeeding or of being raised, but soldiers, sailors and airmen of the beleaguered inflicted severe damage on the principal besieger, Germany, and disastrous defeats on the other axis ally, Italy. The siege had three phases: Direct invasion of England; increasingly destructive and savage air attacks and counterattacks; and increasingly destructive but not decisive blockade of sea lanes approaching the British Isles, maintained by both naval and air forces.

Up to the beginning of 1941, the direct invasion phase remained in the realm of rumour and legend. At least three different attempts at invasion of Great Britain were reported, all supposedly repulsed with great loss to the German invaders. Not the slightest official confirmation of any of these attempts was ever forthcoming from British or German or Italian sources. It is certain that extensive preparations for such an invasion were made by the Germans. It is equally certain that the British were fully aware of them and that numerous powerful and widespread raids were made by the R.A.F. on the "invasion ports," *i.e.*, ports from Norway to France which were opposite Great Britain.

Hundreds of craft gathered, even specially built, for the invasion were destroyed by the R.A.F. on these raids. It is even possible that the R.A.F. surprised and pounced on some of the

numerous German elaborate practice embarkation rehearsals which were a standard part of German preparation for a major operation. This possibility might explain the stories of some sons returning to the United States from points on the German occupied French coast, who stated that they had seen hundreds (some said "thousands") of German soldiers' bodies floating in the English channel off Cherbourg and other points. What was the truth behind the rigid censorship curtain, up to the end of 1940, no authentic information of an actual invasion was published.

If no invasion was actually attempted, it may in part have been due to the fact that the British spared no effort to make such an attempt highly dangerous for the invaders. The broken B.E.F. was retrained and, in the months from Dunkirk to the year's end, literally millions of men were added to Britain's trained garrison. Every possible landing was protected with barricades and a dense network of defensive positions grew up from Land's End to John o' Groat's. Until the attack came and was repelled no man could say that Britain had been made impregnable. However, in those months the country had been brought from a state of widespread vulnerability to become a veritable nation fortress, everywhere and forever on guard.

One very important defence measure taken immediately after Winston Churchill became prime minister was the wholesale internment in prison or concentration camps of thousands of individuals of uncertain loyalty. Where the Chamberlain government had continually temporized with this danger of the fifth column, Churchill, with the examples of Scandinavia, the Low Countries and France before the nation, had no difficulty in securing the most sweeping powers and no hesitation in using them.

Many of those arrested were refugees from Germany's own camps. Undoubtedly many innocent men and women were, for a time, thus confined, but equally certainly hundreds of enemy agents were removed from the opportunity of undermining the country's defence effort. These latter individuals could, perhaps, never have been reached if the government awaited admissible evidence under the usual rules of law. Scotland Yard and the army and aerial intelligence had moral certainty of treasonable activities, connections or intentions, which could not have been proved in a court of law. Action on the reasonable suspicion was, therefore, a very important factor in the defence of England and it is notable that England was the first country under German attack where the fifth column tactic was a virtual failure. The mission of the fifth column in England was to bring about capitulation by agreement to a negotiated peace through highly placed press agents thereby in effect conquering Great Britain without the need for invasion of the British Isles. Failure of this mission forced Germany the unwelcome alternative of the long sea and aerial siege, with all the uncertain hazards of a prolonged war. The drastic nature of the government's action was indicated by the fact that those confined included not only aliens, but highly placed British subjects, including even a member of parliament.

MORE THAN 2,500 LOST THEIR LIVES June 17, 1940, when the British liner "Lancastria" was bombed and sunk by German Stukas off St. Nazaire, France. As the ship rolled over, hundreds clung desperately to the sides. The British destroyer in the foreground rescued many of the 2,400 survivors

MULTANEEOUS FIRE of four British anti-aircraft guns against German raiders the summer of 1940

arrest which was reviewed by the house of commons' parliamentary committee on privileges.

Actual military operations accompanied all these political and massive defence measures. German air raids steadily increased in intensity. Hundreds and, eventually, perhaps 2,000 German planes participated in a single day's raiding. While all parts of England and Wales and many points in Scotland were raided, by far the greatest German effort was directed at London. This phase reached a climax in several great raids in August, in one of which the Germans lost about 200 planes. During this period, heavy plane losses were reported, but the reports of the British and the German authorities were hopelessly irreconcilable. Neutral observers seemed agreed that the German losses were the heavier of the two.

After the August climax there was a period of several weeks of slackening, although hardly a day passed without destructive raids. Then a new phase of night raiding opened with a terrifically concentrated raid on Coventry on Nov. 14. For ten and a half hours, incendiary and explosive bombs were rained on this Midland industrial city. Hundreds were killed. This concentrated raid was followed in the next few weeks by similar raids on Southampton, Sheffield, Bristol, Birmingham, Liverpool and other towns and cities, climaxed on Dec. 29 by a most destructive incendiary bomb attack on the City of London, which destroyed many historical buildings.

Throughout these six months of a mounting inferno of often wanton destruction and slaughter, the civilian population of England won a world's admiration (and the Germans' surprised bewilderment). As the civilian casualties mounted steadily into the tens of thousands (23,081 killed, 32,296 wounded) by the end of 1940, the British people's will to resist mounted with the casualties. The R.A.F., despite the pounding of English industrial centres, gained in striking power. Night after night they carried destructive raids deep into Germany and over the Alps to Italy. The Ruhr, Berlin, Bremen, Mannheim, Danzig, Pilsen in Bohemia-Moravia, Turin, Genoa, Milan and many other important transportation and industrial centres of Germany and Italy, felt the devastating force of the R.A.F. bombers. With merciless thoroughness they pounded the seaports occupied by the nazis from Stavanger and Bergen in Norway to Lorient and Bordeaux in France, ports at which German preparations to invade England

were made; ports and bases for the air and submarine fleet carrying on the German blockade.

As the year 1940 ended, the underlying concepts of the German and British air strategy were in vivid contrast. More and more, Germany had turned back to her terroristic philosophy of war, that widespread and ruthless destruction of an enemy nation, including civilians, was the surest means of breaking that enemy's will to resist. The British tenaciously clung to a studied concentration on vital points essential to the enemy's war effort.

Probably the British did more actual damage to military objectives, including in that term vital industrial facilities and transportation centres, but, proportionately, the damage to Germany was probably not as great as that to England. The German and German-occupied territory was much more extensive than the British; the British had a relatively limited number of planes, and those planes had much farther to fly to reach their targets. The nearest approach the British allowed themselves to the luxury of direct reprisal for mere destruction without regard to military advantage was three successive nights of incendiary and explosive bomb raiding on Bremen, following the wanton incendiary destruction of the City of London. Even so, the military value of the Bremen target area exceeded that of the City.

There was little change in the British blockade, except that they had to blockade a whole continent with fewer ships, operating from more restricted bases after France's fall. The German occupation of the western European littoral had, on the other hand, enormously increased Germany's power of blockade.

This factor alone threw a tremendous added burden on the royal navy and brought forth some inspiring chapters of British naval history, where much attenuated convoy guards did heroic service in protecting their charges against the gravely increased hazards of submarine attack and air spotting and bombardment. One of the great epics of this period was the gallant action of the converted cruiser "Jervis Bay." This 14,164-ton former cargo-passenger liner was the sole guard of a 38-ship convoy which was attacked 1,000 mi. out in the Atlantic by a German warship, apparently of the pocket battleship "Luetzow" (old "Deutschland") class, mounting 11-in. guns.

The "Jervis Bay," devoid of armour and mounting 6-in. guns, sailed in between the "Rangitiki," first ship of her convoy to be attacked, and the enemy warship. She soon went down, in flames, with her light guns firing as her decks were awash. But 32 of her 38 convoyed ships escaped that night of Nov. 5 under

cover of her gallant diversion and her captain, E. S. F. Fegen, received the Victoria Cross—posthumously.

With the enemy in possession of French and Belgian ports and air bases on the very shores of the channels approaching England and with their own ships denied the use of Irish bases, the British destroyer strength especially was terribly overworked. In the late summer, this weakness was somewhat remedied by an arrangement with the United States, whereby 50 older American destroyers, previously out of commission but still effective ships for convoy duty, were added to the British fleet in exchange for leases on British air and sea bases in the western hemisphere. This was the longest step the United States had made toward direct intervention in the war.

The Anglo-Italian War (June 10 to Dec. 31, 1940).—When Italy entered the war on the side of her axis partner on June 10, 1940, she had already rendered considerable aid to Germany. She had created one decidedly weak spot in the Allied blockade and, after the invasion of the Low Countries and France, had forced France to keep much needed divisions immobilized on her Italian frontier, when every man was needed to meet the German invasion.

Italy brought into the war an army of possibly 60 divisions, say between 1,250,000 and 1,500,000 men, excluding native troops in her colonies. She also boasted of a total organized man power of more than 9,000,000, but the military value of most of these was very dubious, if for no other reason than her inability to equip and maintain much more than the 1,500,000 men of the army. The quality of the army itself was far from uniform, ranging from the Alpini divisions, regarded as excellent troops, to large numbers of dubious quality who had never been tested in battle.

Italy brought into the war an air force, in numbers superior to that of France but definitely inferior to that of Germany. She was credited with perhaps 6,000 planes, of which about 3,000 were in active operating squadrons. Many of these planes were obsolete. The Italian navy roughly equalled the French. Inferior in capital ships, Italy was superior in submarines, torpedo boats and other craft designed for waters such as the Mediterranean and adjacent seas. She had sufficient gasoline and fuel oil for a short war, but very limited means of replenishment. Her industry depended on the outside world for materials.

VARIOUS TYPES OF ANTI-AIRCRAFT DEFENCE. Machine guns are effective only up to about 1,500 ft., pom-poms (automatic cannon) up to 5,000 ft., anti-aircraft guns to 20,000 ft. or more. In co-ordinated defence with fighters, the anti-aircraft batteries often concentrate at levels below 10,000 ft. while the planes cover areas above that height. In this way the guns keep bombers high and do not shoot down their own planes.

Italy's part in the defeat of France was rather passive and very impressive. Up to July 10, Italy's part in the war was confined to numerous air raids on Malta, some attacks on British and French naval units by air and several minor colonial raids in north and east Africa.

On July 10 Italian and British naval forces fought indecisive actions in both ends of the Mediterranean. Italian ships in the minor engagements began to establish the reputation that eventually became noted for, that of their ability to avoid action with the British fleet.

During the latter half of Aug. 1940 the Italians launched a vigorous offensive against British Somaliland. In a short campaign they succeeded in wresting control of this desolate area entirely from the British. The colony had so little value economically and such limited military value that there was suspicion that the Italian attack was intended as a diversion to draw British forces from Egypt. If so, the attempt failed utterly to accomplish this objective.

About one month later Marshal Rodolfo Graziani launched his main attack on Egypt across the Libyan desert. He penetrated within a few days to Sidi Barrani, some 70 mi. inside the Egyptian frontier. Here he paused to consolidate his forces for a renewed advance against the British at Matruh and beyond to Alexandria and the Suez canal—at least so it was supposed. However, months passed and the Italians made no further forward move.
